OUR ADVERTISERS RELIABLE

We guarantee our subscribers against loss through dishonesty of any advertisers in the Cultivator. We do not attempt, however, to adjust trifling differences between subscribers and honest, responsible advertisers, nor will we pay the debts of honest bankrupts. Notice of complaint must be sent us within 30 days from date of the transaction, and the subscriber must have mentioned the Cultivator when writing the advertiser.

THIS WEEK'S COVER

A Central California citrus orchard—or rather orchards—of Tulare County has place on the cover of this week's issue. It gives something of an idea of the extent of the citrus industry in the central part of the state. It also gives an idea that the citrus orchardists are up to date in equipment and cultivate well and deeply by use of the large tractor.

STATE WATER COMMISSION

We have information from the state water commission that it has of its own accord made unanimous recommendation that the salaries of two of its $5000 a year commissioners be abolished. The commission is now composed of A. E. Chandler of Berkeley, W. A. Johnstone of San Dimas and Irving Martin of Stockton.

In the present campaign for the restriction of commissions, or of the taxes needed to support these commissions, this action is encouraging. The water commission has been instrumental in stabilizing water rights in this state.

BETTER PRICES

Secretary Houston recently remarked that one important factor in greatest food production for 1919 was not only bigger crops but better prices.

Every business man who is likewise a farmer must look to his bank balance. If prices are unsatisfactory bank balances will be affected and crop production is likewise affected. The biggest factor in securing the satisfactory prices is cooperation, and a definite cooperative marketing organization if possible, but in any case the cooperative spirit on the part of those who have goods to sell. The buyers cooperate much more closely than do the producers.

KEEPING BOOKS?

The question in the title is pertinent and does not come with so much force at this particular moment from the Cultivator as it does from Uncle Sam. However, Uncle Sam does not ask the question directly but he will be asking during the next two months "What has your income been the last year and what are your exemptions?" Next to the large and complicated business concerns we doubt not the farmer has the greatest difficulty in answering these questions of Uncle Sam intelligently and with justice to himself and the government. A few hints on this line are given by Collector Carter on page 5 of this issue.

A NEW CULTIVATOR SERVICE

The Cultivator takes pleasure in announcing that arrangements have been completed whereby Bruce S. Bennett joins the staff in the capacity of live stock field man.

Mr. Bennett has been engaged in live stock newspaper work in the East and South for a number of years and brings to this paper a rich fund of experience and knowledge that will be of value to our readers and the live stock interests of the state.

Mr. Bennett will spend all his time in the field and his work will keep him in the closest touch with the breeders of the state, with whom he will be glad to advise and assist in every possible way. His intimate knowledge of the problems of the pure bred live stock business (he has been a successful breeder) will enable him to render splendid service to those interests.

From the reader's standpoint, Mr. Bennett's services can be utilized in the locating of breeding stock that will best suit the particular reader's need.

This new Cultivator service is free to all who care to make use of it and we trust that our readers will not hesitate to call on Mr. Bennett whenever he can be of help.

It is the earnest desire of the publishers to make the Cultivator an increasingly important factor in the agricultural activities of the state and we will, at all times, welcome suggestions from our readers as to how we can improve our service.

COMMUNITY COUNCILS

The state council of defense has issued an appeal for the formation of 5000 community councils located in various sections of California. The council hopes every section of the state will form these working units which shall operate under direction of the state council.

An immediate task of the community council will be the reestablishment of the returning soldier and sailor and the care of the man or woman thrown out of employment through the cessation of hostilities. The prime idea, however, back of these new new bodies is the belief that organization in time of peace will result in advancements almost as marvelous as the progress along military lines which organization produced during the war.

After the war problems that confront California are more important, if anything, than the problems during the war. This period of reconstruction and of readjustment will be one of the important eras of our national history. We on the Western Coast with unlimited possibilities ahead must organize as we have never organized before.

ELWOOD COOPER

Elwood Cooper, pioneer fruit grower of California and the first in America to make a success of commercial olive oil production, died on Sunday at Santa Barbara. Mr. Cooper was for years, (from 1885 to 1903) president of the State Board of Horticulture and when the board was legislated out of existence and the office of State Horticultural Commissioner created, he was appointed by Governor Pardee as the first State Horticultural Commissioner. His addresses made at state fruit growers conventions contain much of California's horticultural history. In addition to these addresses and official reports to the Governor of the state, Mr. Cooper is the author of books on eucalyptus and a treatise on olive culture. Some six years ago he sold the great Elwood ranch near Santa Barbara to a British syndicate and since that time has lived a retired life at the Arlington Hotel. He was 89 years old.

MOVING THE CLOCK AHEAD

Some Eastern farmers are complaining because of their calculations being upset by the daylight saving scheme of moving the clock ahead one hour during the longer days of the year. We have never heard this complaint from California farmers, at least not to a serious extent, for they have generally taken the position that farm help has been more directly concerned, at least during these war years, with accomplishing results regardless of the clock. Except under pressure of harvest time the nine or ten hour day prevails but even then the earlier hour has not proven generally objectionable. The clock has been principally a convenience to the farmer in informing him as to what the rest of the world might be doing. If the matter were left to the farmers and fruit growers to decide by vote as to moving it ahead, if they did vote in the negative, it would be more as a matter of indifference than active opposition.

COLD WEATHER

Up to Monday night the citrus grower was hopeful that he might be given immunity from extreme low temperatures. Tuesday morning rather changes the complection of things. Dr. Ford A Carpenter of the weather bureau reports that the temperature for a short time on Tuesday morning set the lowest December record in some sections. However, as to injury to fruit, there is strong hope that it has escaped for the reason that the exceptionally low temperature prevailed for only a short time about six o'clock in the morning. The thermometer registered a sharp "V" after five o'clock. One of the larger Valencia producing sections reports as low as 22 degrees, one other reports 25, and other citrus districts, not below 28 degrees. As the weather bureau gave warning some two weeks ago that it was well for orchardists to be prepared with frost fighting supplies it is thought most districts have been protected by liberal use of orchard heaters.

AS TO PORK IN 1919

C. B. Cunningham, president of the California Swine Breeders' Association and a member of the live stock commission for the federal food administration, has arranged for a meeting between producers, packers and food administration officials, to be held at San Francisco, January 10 and 11.

The announced purpose of the meeting is to attempt to establish a minimum price for hogs of 1919 farrow. Such an agreement will of course extend over into 1920.

Just what basis will be used in arriving at the proper minimum is not apparent. As a matter of fact, we doubt if any minimum is needed. With a heavy demand for pork products a certainty, and the probable supply rather short, we look for the market to be entirely satisfactory. Whatever is done must, in the end, conform to the world-old law of supply and demand—and just now no one seems to have much definite information on either point.

The meeting will serve a useful purpose in bringing the various interests together and will probably result in better understanding.

A GREAT INDUSTRY

The greatest of California fruits as represented by dollars and cents is the citrus. The greatest year in this industry was that of 1916-17. That year the total output of citrus from the state aggregated 54,504 carloads. We can not be exact in the value of this great crop to the state but presumably it was around fifty millions of dollars. The average box for that year's output has been approximated by the State Board of Agriculture as $2.16. The past year's values per box are vastly greater than any preceding year in the history of the industry but unfortunately the output, especially of Navels, has been greatly reduced. This because of the "June hot spell" of 1917. The variety which suffered most seriously was the Navel. The present year's output of Navels will however largely make up for last year's losses. The year's rest of the tree seems to be appreciated and it is returning with a large crop this year. The growers have been anxiously watching thermometers these snappy nights but there has as yet been no injury. If another week is passed through safely the orange grower will then breathe freely, for by the middle of January the crop is ordinarily supposed to have passed the danger line.

This condition has created additional interest in citrus planting and already the orchardist who is planning to plant more extensively is concerned as to securing sufficient trees.

PLANT A GARDEN

Now is the time to begin garden ing operations by securing a plot of ground, plowing, fertilizing, and fitting it for early planting. Irish potatoes, beets, carrots, peas, beans, corn, and tomatoes are among the most important garden crops from a food standpoint. Some of the garden vegetables are ready for use in five or six weeks after planting, and these will help fill our own tables and provide for the shipment of food to the million of destitute people overseas. Make a home vegetable garden now and do your share by providing at least a part of the vegetables used on your own table.

Eastern Europe and Western Asia are hungry—in some sections starving. Transportation and other problems will prevent their sufficient feeding for months to come, but Americans are willing to make the problem as easy of solution as possible, hence all making gardens.

The garden should be profitable; it isn't always, but it at least gives healthful exercise and fresh and crisp stuff for the table. Still more it saves wheat—it saves lives.

Start the garden at once.

Citrus Culture---Beginners' Hints

By Ernest Braunton

HUNDREDS are each year added to the number who grow oranges, lemons or other citrus fruits. Part of this number come from our own residents and the remainder are newcomers drawn from every state in the Union. Few of the whole number are well informed as to the basic needs of one who contemplates entering this field of industry. Much of what is written is too academic in character or written on the assumption that the reader knows at least the first rudiments of citrus culture. We have need of a more elementary treatise on the subject.

Few who write make note of soil selection, and information on this phase of the matter is not needed by those who know something of this gi-

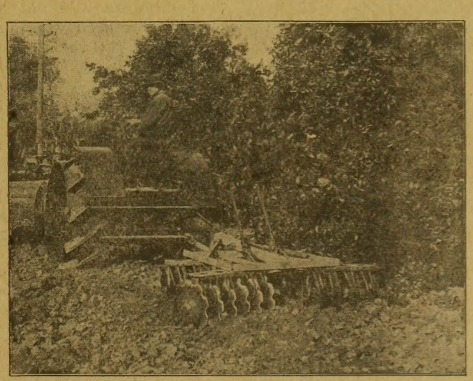
Intercrops in Young Orange Grove

The demands of the times, also the demands of the orchardists' bank account, call for using idle soil between rows of young trees in the production of intercrops. Here is a crop of milo and beans growing between on the grounds of the Southern California Citrus Experiment Station at Riverside.

gantic industry, but all novices are confronted by the question: What soils are best adapted to the growth of citrus trees? As a rule soil is not a serious problem, for some citrus fruits will grow on a great range of soils. No soil is too heavy if the drainage through the upper three feet is good. Sand and gravel only are to be avoided, yet splendid trees and good fruits may be grown in sand if heavily fed with fertilizer and organic matter is worked into the soil from the first year of planting; but on such soils citrus fruits will never prove a commercial success. Planting to suit the soil is a matter of selection of the proper variety of fruit. The Washington Navel thrives on the heaviest soils and does fairly well on very light soils. The same may almost be said of the Valencia Late, but this sort is often a commercial success on soils too light for Washington Navels and, per contra, is not so profitable on the heaviest soils. The latter is, however, but a matter of coloring, the eating quality being in no wise affected. Valencia Lates on heavy adobe soil generally turn green during midsummer, though of beautiful color in early spring. These green oranges are excellent for eating purposes but unmarketable.

The selection of land for citrus orchards should rest on climate rather than on quality of soil, for man has been overbold in selection of location. Year by year new plantings slip farther and farther down toward the valley floors. Then comes a destructive frost and cuts off all the frontier orchards. For a few years this misfortune remains a check on planting in the stricken sections. Finally, emboldened by several years without hard frosts, a few courageous souls creep down toward the lower levels. If more favorable years ensue this extension becomes universal and so continues until General Jack Frost again drives them back to their former position.

In hot interior valleys the Washington Navel is unquestionably the sort to grow. In the cooler coastal sections, where lemons thrive best, the Valencia will prove more successful.



In heated sections lemons may produce a good winter crop, but the summer fruits will be few; therefore lands not far removed from the cooling ocean breezes are best adapted to lemon culture. Pomelos or grapefruit will endure as much heat as any of the family, but are more tender than the leaders among oranges and on a parity with lemons for hardiness. Of all oranges the Satsuma Unshiu, or Oonshiu, is the hardiest of the better varieties, and those who would slip down the slopes, past the danger line for navels and Valencias, are advised to confine their plantings to this hardy variety.

We have sought to make it plain to all that climate is far more of a serious consideration, even in the more favored parts of California, than is the question of soils.

Preparing the Land

As all citrus orchards must be irrigated it is of the first importance that land be even or smooth. It matters not if the land be level or on a ten per cent slope; it should have no uneven spots, for ease of irrigation depends on this more than on grade or slope. This is the most particular piece of work connected with citrus culture. If serious doubt exists as to where water will flow it is well to plow a few furrows and test the smoothness of your plane. Such preliminary work may save you from much labor and expense that would ensue if land is not uniform in surface. After a smooth, even face has been obtained the soil should be stirred as deeply as it is possible to go. A subsoiler should follow the plow especially if the soil be heavy. If an underlying impervious hardpan is present it will be better to use dynamite for every tree hole. No matter how excellent your soil the plowing should not be less than a foot deep. After plowing it should be harrowed until it is smooth, without clods, for a smooth surface will greatly facilitate the work of laying off the orchard for planting.

The question of how many trees to the acre is an interesting one and also very important. A common distance for the more popular citrus fruits is 24 feet apart, on the square system or method. This will give 75 trees to the acre. Practice varies as to distances with all sorts of fruits, and again, variety sometimes dictates. If one were growing Kumquats, ten or twelve feet is far enough apart. Satsumas will have room enough at 16 feet apart. Twenty-two feet is a favorite distance for the navel, but Valencias, lemons, and pomelos, or grapefruits, should never be placed closer than 24 feet and some planters place them at 26 feet apart. At the latter distance you will have 64 trees to the acre, and at 22 feet your navels would number 90 to the acre. By using the equilateral triangular method one would get 103 navels to the acre, but the square method of planting continues the most favored. After the distances have been decided upon the positions should be designated by substantial stakes. The rows should be perfectly straight and each tree precisely the same distance from its four nearest neighbors. Then will the trees line in every direction and the appearance of the orchard be satisfying and attractive to all beholders. All are aware that for economic reasons rows of trees should be straight, but instances are known where sales have not been effected merely because rows were crooked. When you are ready for planting dig the tree holes and do not be stingy in the amount of soil removed. It is best to dig them at least two feet deep and a-like distance across. If bare root trees are planted it matters not how deep the holes at planting time. But balled trees will settle if the loose soil is deep. Therefore it is advisable to fill in part of the soil if holes are deep, and if soil is damp and easily compacted, tread it down solid or run a little water in each hole if convenient. Remember that after planting you can never get under a tree to loosen the soil, therefore dig your holes deep and wide.

Modern Cultivation

Thorough tilth necessary in citrus orchards is secured by putting plenty of power on dependable deep working implements.

Planting the Trees

Set the trees so the union between bud and stock will not be less than three inches above the soil, and settle each tree with an abundant water supply. Never seek to save water in this part of the work or long delay its application after planting; even a few minutes' delay in hot weather may cause a loss, especially when bare root trees are planted in dry soil. It is always better to have water in the holes first if bare root trees are used and settle the soil with water immediately after planting. Bare root trees cannot be so carelessly planted as balled trees for the roots should be carefully and evenly spread, and to do so you will have to get down on your knees and distribute the roots evenly with your hands. If balled trees are used great care should be taken to prevent the balls from being split or broken. In planting, or firming the soil about the trees, never step on the ball and never cut cords on ball until tree is in place and the hole partially filled with soil so that ball cannot fall apart. Then cut cords on top and turn all parts of the sacking down into the hole before filling in remainder of soil. If sacking is left around the stem of the tree a cultivator tooth may subsequently tear the ball to pieces or even pull the tree out of the soil. The sacking will soon rot beneath damp soil. After trees are planted and given their first irrigation they should be carefully looked over before becoming firmly settled in position, to see that all are in line and upright. Many trees settle on one side only and thus get out of their former upright position. If any trees have settled too deep in the soil they should be raised at once. This work cannot be safely delayed. Newly planted trees should never suffer through lack of water. In light soils the trees should be irrigated every week until it is evident through new growth that they are thoroughly established; then irrigations every two, three or four weeks will suffice, according to the nature of the soil. In heavier soils the first waterings may be ten days or two weeks apart. The first irrigations need not be heavy for the lower soil will not be dry, it is a mere replenishment of moisture in the upper soil. Constant cultivation is necessary in young orchards, and if this is well done irrigations may be less frequent, especially if the soil close about the tree is loosened and pulverized with a hoe after each cultivation. Our orchard is now properly planted and started on its way to commercial success, and if any further advice or admonition is needed it is in regard to selecting the trees. One year old trees are preferable to two year olds and should be bought of dealers known to be thoroughly reliable and handling citrus trees on a large scale. You should not run the risk of buying a mixed lot of trees gathered from various sources by a small dealer. Uniform quality true to name is what you should insist upon having. Where soils are light buds upon sweet orange stock are considered slightly better, but if soil is heavy, subject to overflow, or drainage is poor, those on sour stock are best. In the colder sections trees on trifoliate stock have proven somewhat hardier.

Agricultural News Notes of the Pacific Coast

Northern California

The J. K. Armsby Company denies that it would join the food products merger.

The Butte County farm bureau contemplates securing a permanent home demonstrator.

The Rio Bonita farm center is the newest added to the list of Butte County's farm bureaus.

An irrigation district has been organized in Modoc County. It is planned to cover 47,000 acres.

The Sutter-Butte Canal Company is issuing bonds to the amount of $800,000 for refunding and securing surplus for making certain improvements.

Amongst the prune growing counties of the Sacramento Valley Napa leads with 10,000 acres; Solano has 6145; Butte, 5942; Colusa, 4100; Sutter, 3505; Yolo, 2084.

At a meeting of horticultural commissioners held in Sacramento Geo. P. Weldon declared that the 8 to 1 orange test has been an entire failure north of the Tehachapi.

A storage proposition for the purposes of power and irrigation is contemplated for Concow Valley above Oroville. The impounded water will cover about 2500 acres.

Members of the farm center at Cloverdale, Sonoma County, are receiving information in pruning demonstrations given by Adviser Merrill and Horticultural Commissioner Bremner.

The first car of cured olives for the 1918 season, consisting of Greek, Sicilian, Calamarto and Italian style olives were shipped to Boston last week by the Pacific Products Corporation.

As a result of examination held at Redding on November 29, to fill vacancy caused by the resignation of Geo. A. Lamiman of Anderson, B. F. Stroup of Happy Valley has been appointed.

The fourth annual meeting of the Placerville Fruit Growers Association recently held at its packing house showed the association in excellent condition, its packing house paid for and over $2000 in the treasury.

There have been sold 83 farms on the Durham state colony in Butte County. There remains sufficient land which is under lease until 1921 to make six more farms. Including the labor allotments, there are now 125 families living on the colony.

The poultry producers of Central California have secured judgment against a member who sold his eggs outside the association and contrary to his contract with the association, of five cents per dozen on all eggs sold. The total amounted to $244.

It is predicted that there will be expended at least $2,750,000 on irrigation projects on the Pitt River in Shasta County. This will be primarily for the development of hydroelectric power but at the same time will greatly increase storage of irrigation water.

Railroad men running between Oroville and Winnemucca report that many sheep herders were victims of the effect of the recent influenza epidemic, and as a result whole bands of sheep, numbering thousands, were straying over the hills without any one to look after them. It is believed that the aggregate loss from this source may reach $100,000.

Central California

Merced shipped three tons of Christmas turkeys.

San Jose reports total rainfall of season to date ten inches .

The Bean Spray Co. at San Jose is making a $100,000 expansion.

Visalia announces that it will have a citrus fair some time during 1919.

Santa Clara County automobile owners have nearly $2,000,000 invested in autos.

Approximately 40,000 tons of prunes were ruined by the September storm is the latest estimate.

Farm Adviser Sullivan of Kings County is planning to form a dairy department in the county farm bureau.

The board of supervisors of Monterey County authorized an assessment of $60,000 on Reclmation District 1665.

The Santa Cruz farm bureau has outlined a program for the year 1919 touching nearly every angle of agriculture.

County Horticultural Commissioner Howard of Kings County has conducted one of the most energetic campaigns in squirrel eradication.

Some Fresno County raisin growers are suing picking contractors because fruit not picked at proper time was caught by the early rains and practically destroyed.

County Commissioner Collins of Tulare County and Rodent Control Superintendent Jacobsen announce that they will put Tulare County squirrels through their paces.

Ranchers of the beach road, Trafton and San Andreas districts in Santa Cruz County are considering a plan of cooperative buying of carbon bisulphide for squirrel control.

San Joaquin County reports the growing of sugar beets as becoming one of its most important industries. The Spreckels people now operate a million dollar factory at Manteca.

The California Grape Growers' Protective Association, after the suggestion of their attorney, has decided to remain an active organization indefinitely and to fight pending prohibition legislation.

The chamber of commerce of San Jose is exhibiting specimens of the Keesling walnut, said to be exceptionally well adapted to that section, and one of the most promising nuts recently brought out.

A favorable report on the Kern River watershed irrigation enterprise is expected to be filed in January. The proposed project is to include the fertilizing of the entire territory watered by the Kern River system.

Plans are being considered by the Oakdale irrigation district in Stanislaus County by which 125,000 acrefeet of water will be diverted from the Stanislaus River. The cost of the project will be about $2,000,000, and about 75,000 acres in the Oakdale district will receive additional water.

A state dairy council composed of representatives of all California milk producers and manufacturers of dairy products is created by resolutions passed by the California Creamery Operators' Association which recently met at Visalia. The association declined to adopt a resolution favoring the elimination of the state dairy bureau, substituting a single commission.

Southern California

Imperial Valley cotton gins are running day and night.

The cannery at Elsinore, Riverside County, is running on pumpkins.

Hemet orange growers are netting about $4.00 for early shipped navels.

A big dredger is working in the drainage district near Talbert, Orange County.

County Horticultural Commissioner Sharp reports 231,620 acres under cultivation in Riverside County.

County Commissioner Coy of San Bernardino is making thorough canvass of the squirrel situation.

Los Angeles announces the first exclusive rabbit show held on the Pacific Coast. It opens January 16.

Orange growers who received five and six dollars per box for Christmas fruit are highly pleased at the returns.

Los Angeles County farm bureau is conducting a vigorous membership campaign. The present membership is 2250.

Farm Adviser Wahlberg of Orange County has been conducting a series of pruning demonstrations. He was aided by Prof. H. S. Reed.

The La Verne Orange and Lemon Growers Association is building a 68 by 118 foot addition with concrete base to its packing house.

The fourteent annual show of the Southern California Poultry Breeders Association opens in Los Angeles January 8, continuing for a week.

Redlands shipped 114 cars of Christmas navels; Riverside, over 100. These are heavy shipments for holiday fruit from Southern California points.

Prof. J. C. Whitten of the University of California is giving deciduous pruning demonstrations under direction of various Southern California farm bureaus.

Hemet, Riverside County, reports the olive crop as somewhat less than earlier estimates. The fruit, however, is running to exceptionally large sizes and commanding long prices.

The Hemet-San Jacinto Growers Association has placed a value of $111,000 on its cannery. This association has made one shipment of eight cars of canned peaches to the war department.

The Charter Oak Citrus Association has elected for the coming year: Wm. Bowring, president; W. E. Clopine, vice president; P. B. Letchworth, Arthur Bowring, Martin Fesler, Charles Menefee, C. P. Colver, William Hoogendyke, manager.

At a meeting of the farm bureau directors of San Bernardino County it was urged that other county bureaus of the southern part of the state should unite in making an appeal to the college of agriculture for more direct help in solving agricultural problems.

The Covina Heights Citrus Growers' Association reports averaging for its last year's output; Navels $3.54, Valencias, $5.67, other varieties, $1.86, or an average all grades all sizes $5.15. Officers for the coming year are: D. J. Overholtzer, president; C. A. Leighton, vice president; R. L. Hendrix, manager and secretary; M. M. Knudtson, P. C. Bashore, S. Douglas, E. M. Bosworth, F. M. Sterling, C. D. Webb, W. L. Case.

The Coast and General

The first car of California mixed vegetables reached New York the second week of December.

Beet growers in the Inland Empire, Eastern Washington and Northern Idaho, received last year $14,000,000.

According to the Texas agricultural college a special effort is being made to restock France with pure bred poultry.

Florida's state food commissioner has served notice on shippers of citrus fruits that hereafter "short" boxes must be distinctly marked.

The movement of Florida lettuce continues quite slow. Only 181 cars had gone forward up to December 7 compared with 267 cars last year.

The war trade board has ruled that no individual licenses will be required for the export of raw cotton to Great Britain, France, Belgium or Japan.

The Florida Fruit Exchange reports selling but a small quantity of fruit at auction; f. o. b. orders are received for practically all holiday offerings.

It is stated that shipments of tomatoes on the West coast of Mexico will be about 100 cars. The season extends from the latter part of December to July 1.

Florida orchardists are appealed to to make trial of fumigation in Florida as a method of controlling scale pests. The use of fumigation in Florida has as yet been very limited.

The largest apple order ever placed in the Pacific Northwest is being handled by the Hood River Fruit Company. The order, of English origin, calls for $1,000,000 worth of apples of all varieties and grades.

From November 27 to December 3, 118 cars of dry beans were shipped from California. Seattle states that during the same period 325 tons of Japanese beans were received at that port while Portland received 500 tons.

The seed reporting board of the United States department of agriculture predicts that growers of commercial vegetable seed will meet a much larger foreign demand for their product during the year ending July 1, 1919 than during the previous year.

Castor oil plants growing in Florida and Georgia have been seriously infected by a fungous disease, ricinus communis. The plants wilt very much as do potatoes and tomatoes when affected by the ordinary wilt and instructions have been given to plant no castor beans on land where the solanums have been grown.

The Community Millers Association of America conducted the last season an increased wheat acreage campaign, offering medals and prizes aggregating thousands of dollars in prizes to the millers who secured the greatest wheat acreage increase. The first, second and third prizes were won by farmers in Oklahoma, Texas, Illinois.

Apple shipments from the five Pacific Coast states from December 4 to 9 inclusive, were as follows: On the 4th, Washington 160 cars, Oregon 35, California 23; on the 5th, Washington 153; Oregon 23, Idaho three; California 12; on the 6th, Washington 124, Oregon 25, California 20; on the 7th Washington 115, Oregon 26, Idaho two, Utah one, California 24; on the 8th, Washington 74; on the 9th, Washington 61, Oregon ten, California 2.

The Duty of Water

Written for California Cultivator by J. B. Neff

THE duty of water is usually defined as being the amount of water necessary to produce a crop, and varies according to the kind of crop and the soil as well as the climatic conditions.

The unit of measure for reservoirs is the cubic foot, but this is too small for convenient use, and the acre foot, or quantity which will cover an acre one foot deep, is more generally used for large bodies of water. The term "acre foot" is to be preferred as it bears a direct relation to areas to be covered with water. The time unit is usually one second, and flowing water is measured by "second feet' or the number of cubic feet passing a given point in one second of time. Measurement is frequently expressed in miner's inches, but a miner's inch is a variable quantity, though 50 miner's inches in California equal one "second foot," and a constant flow of 50 miner's inches for 24 hours will equal two "acre feet," that is, cover one acre two feet deep. One hundred miner's inches will cover one acre two inches deep in one hour.

Experiments have been made to determine the amount of water necessary to produce crops of different kinds. Among the most important of these are the experiments of Prof. King of Wisconsin, who has found that it requires from 300 to 500 pounds of water to produce a pound of dry material. That is, to produce a ton of hay it is necessary to have from 300 to 500 tons of water, which must be supplied by rain or irrigation, in addition to moisture which goes away through evaporation from the ground. Enough water to cover an acre one inch deep will weigh about 113 tons, so that if one ton of hay is to be grown on an acre there must be from three to five inches of water applied at the proper time, in excess of that wasted by evaporation. The amount used is always largely in excess of this, as rains do not come at the time nor in the quantity that will do the most good.

The water which passes into the air through the leaves of a plant is said to be transpired, in distinction from the general evaporation which goes on from the ground as well as the plants. The effect of dryness is to increase transpiration, and when the roots cannot get sufficient water to supply this transpiration, the plant withers.

Transpiration takes place chiefly during the heat of the day and is enormous at times. An ordinary crop of grass, which will make two tons of hay to the acre, will transpire six and a half tons of water on a dry day, or more than 200 tons in a month in addition to the evaporation from the ground.

An ordinary crop of wheat will transpire from 250 to 300 tons of water per acre during the growing season. One hundred pounds of growing meadow grass contains an average of 70 pounds of water, and 100 pounds of red clover or alfalfa contains over 80 pounds of water. Such moist plants as lettuce, cabbage, etc., contain as much as 95 to 98 pounds of water to 100 pounds of fresh material.

The amount of water to be used varies with the kind of crop that is being grown; thus the water required to produce one cutting of alfalfa hay on one acre will be sufficient to produce a crop of corn on five acres. When it is considered that from four to six crops of alfalfa are taken from the same land every year it will be seen that a large supply of water must be on hand to grow alfalfa successfully.

The quality of the soil being sandy loam and the climate being that of the Southern Coast counties, with 15 inches of rainfall, it may be said that corn will require, in rain and irrigating water, 20 inches to produce a crop; a walnut orchard with trees 12 to 18 years old will need 25 inches; an orange orchard in full bearing should have 30 inches; and an alfalfa field will not do well on less than 60 inches for the season. The amount necessary on cultivated orchards will be greater or less in accordance with the amount of cultivation they receive; the better cultivation the less water will be needed.

Soils that are sandy will require more water, but where there is danger of leaching, the water should be applied in smaller quantities and oftener, while heavier soils that are more retentive will need a less number of applications and it can be applied at longer intervals.

Very dry climates require more water and in some of the Arizona valleys where crops with shallow roots are grown, it is necessary to run water on the ground every eight to twelve days.

It is best to begin the season with the ground thoroughly wet and if the rainfall should be insufficient the irrigation should be done before the weather becomes hot, so as to avoid excessive evaporation.

The depth of water required to soak the soil varies, but it has been found that one inch of water will saturate dry soil about three inches deep, though moisture will in a few days reach several inches farther and give the ground the appearance of being wet when it is very much below the point of saturation and would retain considerable additional moisture.

Income Tax

AGAIN it's time to make income tax return. Here are suggestions and details regarding the report as made by Jno. P. Carter, collector for Los Angles district.

In addition the Cultivator will be glad to submit any questions sent this office regarding details of making out the return.

* * *

A special form of income tax return designated as Form D1 has been provided for the use of individuals whose principal income is derived from farming or ranching operations. These forms will be furnished by this office to those in need of same upon application.

A record of income received and amounts paid out for expenses should be kept by farmers and ranchers in such a manner that they will have the necessary data available at the close of the year to enter upon the return referred to. General instructions relative to the preparation of returns by farmers, ranchers, etc., are given below:

Inventories

This return may be used by farmers who take inventories of crops, live stock, etc., on hand at the end of each year (and thereby include in their income the value of the products raised but not sold). It may also be used by those who do not take inventories. Separate summary forms are provided for farmers who use inventories and for those who do not.

The government prefers the inventory method, as it shows each year's income more accurately. The total amount of tax due will be substantially the same under either method, as the sale price of all products raised must eventually be included in income.

The inventory method can not be used, however, unless you actually took an inventory at the beginning and end of the year for which your return is made.

If you made an inventory of animals, crops, products and supplies on hand December 31, 1916, and December 31, 1917, enter the amount of both inventories on the return. You may include in such inventories live stock, crops, etc., produced on the farm. Live stock purchased for draft, breeding or dairy purposes, or for any purpose other than re-sale, may be included in the inventory at a figure which will reflect the reduction in value estimated to have occurred through age or other causes. Such a reduction in value should be based on the cost and estimated life of the stock. The opening and closing inventories must cover exactly the same classes of items. The opening inventory must be the same figure as the closing inventory of the year before.

If inventories are used, losses of live stock bought for resale, or of any other articles included in your inventories, are not deductible as such losses will be reflected in the inventories.

What to Report as Income

All income from whatever source derived, must be included in this return, except the items enumerated below, under "Receipts exempt from tax."

Only income actually received need be included, but this does not mean that the taxpayer must receive cash. Anything of value received instead of cash must be considered income to the extent of its cash value. Any income received by your wife or dependent children under eighteen must be included in the return, unless wife or child make a separate return.

Receipts Exempt From Tax

The following classes of receipts are exempt from income tax, and need not be reported:

1. Salaries, wages, etc., received from states and political divisions thereof, such as cities, counties, townships.

2. Gifts, not made as a consideration for service rendered, and legacies (but the income derived from money or property received as a gift or legacy is taxable and must be reported).

3. Interest on bonds of the United States issued before September 1, 1917, and on bonds issued since that date, provided no more than $5000 worth are owned.

4. Interest on bonds of United States possessions (Philippines, Porto Rico, Canal Zone).

5. Interest on bonds of states and political subdivisions thereof, such as cities, counties and townships.

6. Interest on federal farm loan bonds.

7. Proceeds of life insurance policies paid on the death of the insured, and payments to policy holders under endowment and similar policies, provided such payments do not exceed the premiums paid in. The amount by which such payments exceed the premiums paid in is income and must be reported.

Deductions

Report as deductions only amounts actually paid out in carrying on your business. Do not deduct personal or family expenses.

Taxes—Do not deduct inheritance or estate taxes, federal income tax, drainage taxes, or taxes for any improvement or betterment. Be ready to show tax receipts, if possible.

Insurance—Do not deduct premiums for insurance on dwelling you occcpy, or life insrance premiums.

Labor—Do not deduct amounts paid to your own minor children unless you also report such payments in section B (page 4) as income to them (which must be included in your income). Do not deduct amounts paid to persons engaged in work in or around your dwelling.

Repairs—Do not deduct the cost of any permanent improvements or betterments to farm buildings, or of new machinery. Do not deduct the cost of repairs to the dwelling you occupy.

Depreciation—Depreciation of farm buildings and equipment not offset by repairs may be deducted.

The depreciation claimed should not exceed the actual cost of the property divided by its probable life in years.

Do not deduct depreciation on your dwelling or household furniture. If you have calculated your income by the inventory method (see instructions under "Inventories") do not claim under "Depreciation" any reduction in the value of articles that are included in your inventory at a figure which reflects the reduction in value. (See also caution under "Automobile expenses" below.)

Losses—You may deduct losses resulting from fires, storms, or other casualties, not compensated for by insurance or otherwise. However, if you calculate your income by the inventory method, you may not deduct losses of any property included in your inventory.

If you do not use inventories, you may deduct the actual cost of purchased live stock lost by disease or injury. The cost of live stock raised on the farm may not be deducted.

Automobile Expenses—You may deduct the expense of operation, repairs, and depreciation of automobiles used exclusively in your business. If an automobile is used partly for business and partly for pleasure, the claim for expense must be clearly established before it can be allowed.

"The efforts and achievements of the millions of farm men and women have been noble and remarkable. The farmers have occupied the first-line trenches of the food army. They and the agencies assisting them, the federal department, the state colleges, and departments of agriculture, were prepared when we entered the war and had been for years, and I venture the assertion that no section of our people and no agencies have done a better job."—Secretary Houston.

UNIVERSAL BRAND
ORCHARD SPRAY

For dormant season spraying you want a good, general clean-up spray; a spray that will serve not alone as an insecticide—but will tone up and stimulate your fruit trees. For instance—

Crude Oil Emulsion

You can depend on this to control the scale insects. It penetrates the cracks in the bark and *kills the eggs*. So—what chance is there for Red Spiders, Aphids and their creepy brothers to do much damage?

Order your Universal Spray now—don't take any chances.

Among the other sprays we manufacture or distribute are:

Dormant Soluble Oil
Bordeaux Mixture
"Triumph" for Citrus Trees
Lime Sulphur Solution
Arsenate of Lead
Miscible Oil No. 1 for Olives
Miscible Oil No. 2 for Thrips

Whenever you have any questions to ask—write our Service Department, in charge of Paul R. Jones, Entomologist. This expert advice costs you nothing.

Winter Management of Soils

Written for California Cultivator By H. Culbertson

THE following suggestions are for the red granite soils. Such soils when short in vegetable matter are inclined to run together with heavy rains and become very compact. Experience has suggested some things that are of value in handling them.

In the first place the preparation for sowing grain. It is important that the plowing be rather shallow. If deep plowing is done just before sowing in the fall or winter the ground gets very compact and unfavorable for plant growth. The surface that has been exposed for a number of months does not compact so much and hence should remain on the surface. Turning it under by deep plowing and placing on the surface the soil that has not had exposure to the surface conditions, the main object of plowing and tillage is defeated. The most of us come to California with deep preparation of soil ideas and are inclined to criticise the older experienced grain growers for their seemingly careless method of putting in grain. Sometimes it takes a number of seasons to get the reasons for the shallow preparation. The success of the shallow preparation is the proof that it must be correct. The main reason for it seems to be that the ground does not get so compact and is more favorable for the crop. The deep plowing comes in the spring where it is to be fallow all the season. The unexposed soil gets its preparation during the season, leaving it in good condition if allowed to remain on the surface.

There are some things in winter practice on soils intended for spring cropping that are of value. It is a common remark that some seasons when heavy rains come especially, that ground plowed before a heavy rain gets into much worse condition than the unplowed. It seems to run together as deep as it is plowed. Before it can be reached by tillage it gets so unmanageable that it cannot be put into proper condition during the season. While plowing a good depth under good soil preparation methods is a desirable thing under ordinary conditions, we might not do it if we knew a big rain of three or four inches was coming and would put the soil in worse condition than if not plowed. The man that tries to keep his work in good shape wants to begin fairly early and has to take some chances on the excessive rains.

One of the things that aggravates conditions is to leave the surface smooth. After plowing, the ground is harrowed to pulverize it and leave it in fine condition. Unfortunately this is the worst shape it can be in for the heavy rain. The difficulty can be largely overcome by cultivating with large tooth cultivator. The shovels should not be less than four inches across. Still better, put in regular irrigation furrows, close together, the object being to leave the surface as uneven as possible. Should the heavy rains come it will be in as good a condition as possible. The ground will absorb as much or more of the water and the ridges between the furrows especially will hold in good condition to pulverize longer and work much easier than if not furrowed.

All winter cultivation should be with wide shoveled cultivators to leave the surface very uneven.

If conditions are such that barley can be sowed early and make a growth that will be a foot or more high about the first of February, when such plowing should begin, soil conditions will be much improved. The ground at that time will be full of fine roots, and turning under the upper growth leaves it in condition to take in the largest possible amount of the rainfall to be stored in the subsoil. If the barley crop is a large one and two feet high or more the fresh plowing will need packing to decay the crop turned under. The best common tool for the purpose is the common disc cultivator. Set it the reverse from the position for cultivation. It is surprising how it will close up the open spaces between the furrows and leave the ground in condition to decay the turned under crop. It will be as little subject to the compacting by heavy rains as can be secured under ordinary circumstances.

The annual barley treatment as above will keep the best conditions for continuous summer crops or deciduous orchards and vineyards.

A point in the management of winter gardens along these lines will often make the difference of success where failure would otherwise be the result. The writer has plowed up his garden twice after heavy rains, because the ground became so packed that it was considered best and cheaper to plow it up than to try to work it. This trouble is easily overcome by simply making a good irrigation furrow between each two rows. Make the furrow deeper than ordinary. If the rain is an excessive one the furrows will carry off the injurious excess. It is surprising how easily the garden is hoed or raked after such treatment and it is in much better condition for the crops. Instead of solid compact soil it is loose and friable.

The ordinary preparation for a garden is to make it quite smooth and even. This is one of the best preparations for a compacted soil if the heavy rain comes. The irrigation furrow put in at the time of planting and renewed after each hoeing or raking is the effective remedy.

Fertilizing

THE problem of fertilization is one of the longest with which the orchardist has to deal. He is unable to rotate crops; he is confronted with an unnatural soil condition which calls for considerable ingenuity, to say nothing of information as to soil physics and soil chemistry. His knowledge of physics and chemistry may enable him to determine what he would like to do, but when possibilities of securing the material which he reasons is needed to improve his soil is considered, and, still more, when the cost of these humus formers and fertility givers is considered, the problem becomes a serious one.

The use of stable manure is generally recognized as giving the best returns, especially considering its physical effect, but the trouble with stable manure is that the supply, always limited, grows smaller day by day while the demand is increased. This lack is made up in part by the growing of green manure crops, but this fails, or at least has limited usefulness, in the oldest orchards, and does not, when used alone, give the returns desired. The liberal use of phosphorus and potassium with green manure crops does, however, aid materially in increasing its advantages.

Just at this time of the year, or within the next few weeks, the question of the use of nitrates or ammonia or blood or some other quick acting fertilizer, which may induce heavier setting of fruit, will be discussed. On California soils there has been almost invariable beneficial results from the use of nitrate, though the experiments at the Riverside station have shown advantage from continuous use of blood or an organic form of nitrate. As between nitrate of soda and sulphate of ammonia it must be borne in mind that the soil on which experiments are to be performed is to be considered. Nitrate of ammonia on a heavy moist soil which has a tendency toward acidity may not give most beneficial results. On such soils there is little question that a nitrate would be preferable.

Some interesting demonstrations have been made under direction of the United States department of agriculture in Porto Rico. From the summary of a report of the demonstrations we quote:

Summary

"The response to fertilization was very prompt and the effect pronounced on both trees and quantity of fruit produced.

"In each plat given but two elements the leaves were smaller and lighter in color than in those given a complete fertilizer. This difference in color was not great in the grove at Bayamon, and was most pronounced in other groves during period of drouth. In the grove at Pueblo Viejo the color was poorest in the plat given no phosphoric acid, and in the grove at Manati, where no nitrogen was given.

"The growth in the check plats was so slow and unsatisfactory that all except one were discontinued before the conclusion of the experiments. Where but two elements were given the growth of both trunk and top was much slower than where a complete fertilizer was given.

"The appearance and growth of the trees in plats given a complete fertilizer were practically the same except that in a plat given nitrogen in the form of dried blood they were not as thrifty.

"The weight of fruit per tree harvested from the check trees was but 27 per cent of that from the trees given a complete fertilizer.

"Where records of yields were made, the crop from plats given a complete fertilizer was decidedly greater than where but two elements were applied. In one grove the gain in yield by plats given three elements over those given two was 80 per cent, and in the other 44 per cent.

"When but two elements were applied, the plats given no nitrogen gave the poorest yield. The plats given no potash bore more than the plats given no phosphoric acid or those given no nitrogen.

"The average weight of the fruit per hundred was heavier in the plats given no nitrogen than in those where phosphoric acid or potash was omitted.

"Where potash was applied in the form of muriate, the crop was heavier in one orchard and slightly lighter in the other than where applied in the form of sulphate. These differences are too small to indicate that for the quantity of fruit production one form of potash is superior to the other. No differences were noted between these plats regarding quality, flavor, or color of fruit.

"In the grove at Pueblo Viejo, where the element nitrogen was applied in the form of nitrate of soda, the yield was but 83.7 per cent of that where an equal amount of nitrogen was given in the form of sulphate of ammonia. At Bayamon there was practically no difference resulting from the two treatments.

"The yield from the plat given nitrogen in the form of dried blood was but 75 per cent of that where sulphate of ammonia was given.

"No marked difference in flavor of fruit was observed resulting from the application of different fertilizers.

"Difference in time of ripening of the fruit in fertilized plats, resulting from different fertilizers applied, were not apparent. The fruit ripened earlier in the check plat than in the fertilized plats."

A Campaign to Protect You in Buying Your Watch

RALPH WALDO EMERSON, speaking in one of his essays of a distinguished man, said: "He is put together like a Waltham Watch."

This remarkable tribute to Waltham greatness is the result of the genius of many men whose inventive faculties have been concentrated for nearly three-quarters of a century to make it the wonderful time-keeping device it is.

The buying of a watch is an investment in time-keeping. And time is the most valuable possession of man.

You purchase a watch for one thing—to keep correct time for you—to tell it to you with dependability at any moment of the day or night.

A good watch, therefore, must have something more than good looks—it must have good "works."

Millions of people imagine that the "best" watch is made abroad—or, at any rate, that its works are imported from there.

Yet, in competitive horological tests at the world's great Expositions, Waltham has not only defeated these watches of foreign origin, but all other watches as well.

In a series of advertisements we are going to show Americans that there is a watch built in the United States whose time-keeping mechanism is more trustworthy than those of foreign make,—

A watch that is easily and reasonably repaired because its parts are standardized,—

Duane H. Church, famous inventor who filled the great shops at Waltham, Massachusetts, with exclusive watch-making machinery that performs miracles of accurate and delicate work which the human hand could never equal.

A watch that represents American leadership in mechanical skill,—

A watch that has revolutionized the art of watch making and assured accurate and dependable time-keeping.

We are going to take you through the "works" of a Waltham—lay bare those hidden superiorities which have led the horological experts of the greatest nations to choose Waltham as *the* watch for the use of their government railroads.

When you have finished reading these advertisements, which will appear regularly in the leading magazines, you will walk up to your jeweler's counter and demand the watch you want—because you will know how it is built and why it is superior to the foreign watch.

Look for these advertisements. Read them.

THE WORLD'S WATCH OVER TIME

Turn Cutlery Steel Into Your Fields!

Do It With Clark "CUTAWAY" DISK HARROWS

That's what the disks are made of—a special cutlery steel—forged edge (cut out or solid)—so sharp and sturdy that mother earth crumbles into tiny particles just as you want her to.
Pulverize the soil well. Get it in the best condition to give the world bigger and better crops. Our Allies are depending on them.

WRITE FOR THIS BOOK

It's a valuable one to have; tells what you need to know about "The Soil and Its Tillage." With it, we will gladly send our complete Implement Catalog and names of your nearest dealers in CLARK "CUTAWAY" Implements.

The Cutaway Harrow Company
709 Main Street, Higganum, Connecticut
Maker of the original CLARK Disk Harrows and Plows.

E. P. BOSBYSHELL CO. General Agents Clark's Harrows
Dealer in Farm Implements, Vehicles and Road Grading Machinery
125-127 N. Los Angeles St. Los Angeles, Cal.

CROP PRODUCTION

Is controlled by the kind and quantity of plant food furnished the tree or plant.

It is not enough to merely fertilize. It is important that the tree be fed material giving maximum results under California conditions.

These materials are furnished in

Hauser's Organic Fertilizers

Correct fertilizer for California conditions.
Send for fertilizer booklet, tells you why.

Hauser. Packing Company
Los Angeles

Easy Ditching

THE "good old days" of a pick and shovel have become memories. Instead of spending a week on a mile of ditch, Mr. Farmer now completes the job in a few hours. He does a better job, too—and saves a BIG LOT of *valuable* time. He does it with THE Martin

DITCHER, Grader and Terracer

Makes new ditches; cleans old ones; grades roads; builds dykes and terraces. Cuts alfalfa, Bermuda grass or sweet clover roots from ditch banks, without plowing. Does more work and better work than 100 men with old methods.

Made In Horse and Tractor Sizes

All steel. Reversible. Adjustable. No wheels, cogs or levers. More MARTINS now in actual use than all other farm ditchers combined. Warehouses and distributing points in nearly all Western States. Write for free descriptive catalog and nearest distributing point, together with list of MARTIN users near you.

Prunings for Humus

DISPOSAL of cuttings of either citrus or deciduous orchards has proven somewhat of a problem, and the question is often asked of the Cultivator, "Is it not best to return these prunings directly to the soil, securing from them in the course of years a supply of humus?" This has called for a satisfactory cutter or other means of working prunings up so they will incorporate with the soil. These cutters have been used and, it has been found, without prohibitive expense. We give herewith illustration of one of the newest forms of these cutters.

Heretofore the practice has been to burn these prunings. While the ashes possess some fertilizing value it is not nearly so much as is in the prunings themselves when cut up into short lengths, for besides incorporating all the fertilizing value of the stock with the soil it has the additional advantage, when handled in that manner, of putting humus into the soil and thus improving its tilth.

The method of using this vine cutter is to trim the trees or vines and drop the trimmings right on the ground every other row, driving the vine cutter down the row where there are no prunings and feeding it from either side, thus eliminating the work of piling the prunings and burning them, for with one handling the prunings are put into the machine which cuts them up into short lengths and scatters them over the ground so that they can be plowed in; the cuttings being sufficiently short that they will not sprout.

Humus from Orchard Prunings

Here is the latest improved implement for reducing orchard prunings to short lengths so they may be incorporated with the soil. It is on the principle of a feed cutter and it is declared to be a complete success. This engraving by error was used last week over the wrong caption.

Seed Wheat

THE distribution of seed wheat in California has resulted in great increase of average production. One institution alone, the Sperry Flour Company, has sold more largely of the improved varieties than any preceding year. For instance, Early Baart, originally introduced to Arizona from Australia, and since become practically the only milling wheat in Arizona, has had greater distribution than any other. Norman F. d'Evelyn writes regarding distribution that this season's totals are Early Baart, 10,761,693 pounds; White Australia, 1,320,880; Club, 1,265,121; Sonora, 390,265; Sperry No. 1 (Bunyip), 142,469.

Striking an average for the characteristic grain lands of the state, the wheat sold at the time these figures were compiled was sufficient to sow 163,299 acres. This represents a very substantial part of what has been the average acreage of the entire state in recent years. The true significance of this accomplishment is appreciated when one turns to the official figures: 1912, 370,000 acres; 1916, 350,000; 1917, 375,000.

At this writing the prospects for the season are very bright. Projecting the yield at as low an average as seven sacks to the acre, the land for which wheat was sold through this one source should produce 143,093 sacks. The value of this wheat as the sacks come from the harvester, figured at $4.35 a sack, would amount to the imposing sum of $4,972,364.55.

In a preliminary report George R. McLeod of the Sperry Company wrote:

"The writer has inspected several fields which were sown to Northern Early Baart wheat and in every in-

Saving One Man

In the issue of December 28 on Page 663 was an article headed Save One Man. It touched upon the necessity for labor saving appliances amongst which "The tractor has proved the most potent in making the farmers' campaign successful." The article then describes certain extensions which made possible the control and guiding of the plow and other implement which the tractor was hauling. By an unfortunate error the wrong engraving was used in connection with this article. By turning back to the article and then comparing with the Samson Sieve-Grip illustrated above a clearer idea of the advantages offered by this improvement may be had.

stance the germination of this wheat has been very satisfactory.

"If Early Baart wheat does as well in yield and proves to be as good in quality as it has the past two years, we are of the opinion that this drive will go a long way toward bettering the quality of wheat in California and will also prove to be a more satisfactory crop to the farmers than the varieties commonly grown by them."

At the very beginning of the season all available California Early Baart was disposed of and the bulk of the wheat sold was obtained from Washington, and a substantial amount from Arizona. Had it been possible all season to obtain a limited amount from these sources of supply, the sales would have swelled very materially. It may be added that the volume of sales of Sperry No. 1 (Bunyip) were negligible for the reason that very little of this new type is yet available.

EUROPEAN CORN BORER

Massachusetts opened its doors to one of America's worst insect pests, the gypsy moth. It has cost the state and nation millions and the fear that this pest will sweep the entire country still menaces us. Now comes the the report from the same state that it is entertaining another pest which, if allowed to go unchecked, will wipe out America's greatest crop, corn. It is the European corn borer. The pest only covers now a few counties in the eastern part of the state, but the seriousness of the situation has called for the organization of a plant test committee with headquarters at Boston. This committee has issued a statement regarding the borer from which we quote:

Sneaked in as a Stowaway from Europe

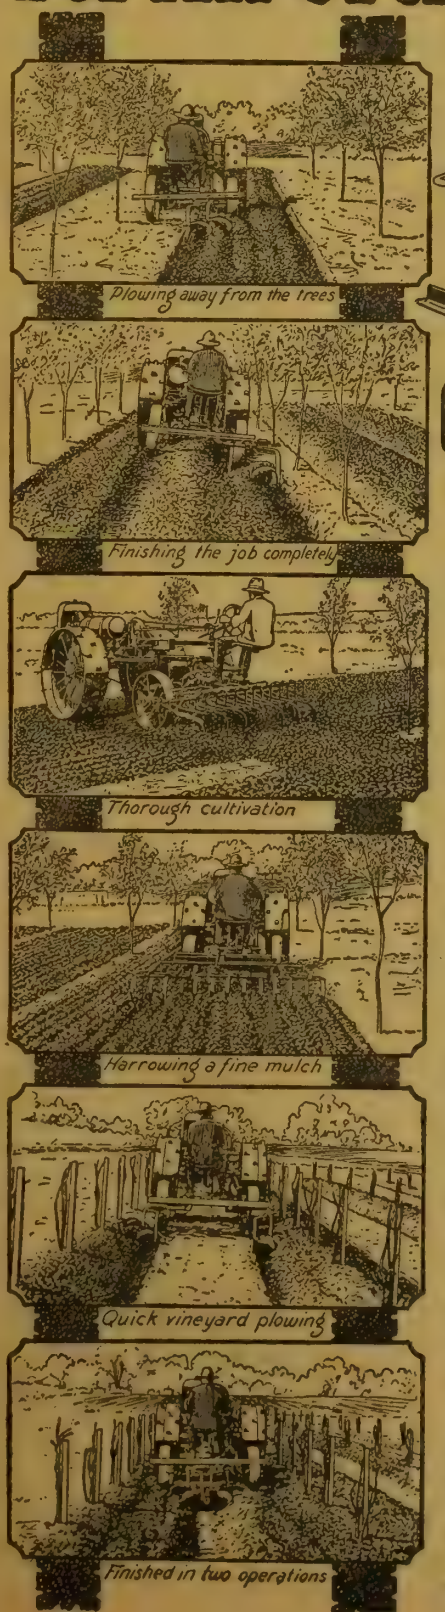
This enemy managed to somehow stowaway in a cargo of hemp that was brought from Europe some eight years ago for the benefit of a New England cordage factory. Its presence is known here now, and its capacity for destructiveness has been sufficiently demonstrated. Moreover, the study of its habits in this and other lands, that has already been made by our entomologists, shows that it is a thoroughly undesirable citizen and must be attacked at once with all the force of brain and money that can be mustered, and with exterminative purpose.

At present, so far as any one can discover, the corn borer is encamped on a relatively narrow area just to the north and west of Boston. To Medford, that was first forced to harbor the costly gypsy moth, is given the unenviable new distinction of having unwittingly given first sustenance to this new horror. Thus far its known range is but 325 square miles but its capacity for spreading even by natural means is great, and it is almost certain to be given a lift along the road by railway trains and automobiles, so that the entire country will be at its mercy unless the organized forces of the nation and its states act quickly and effectively in a determined effort to stamp it out.

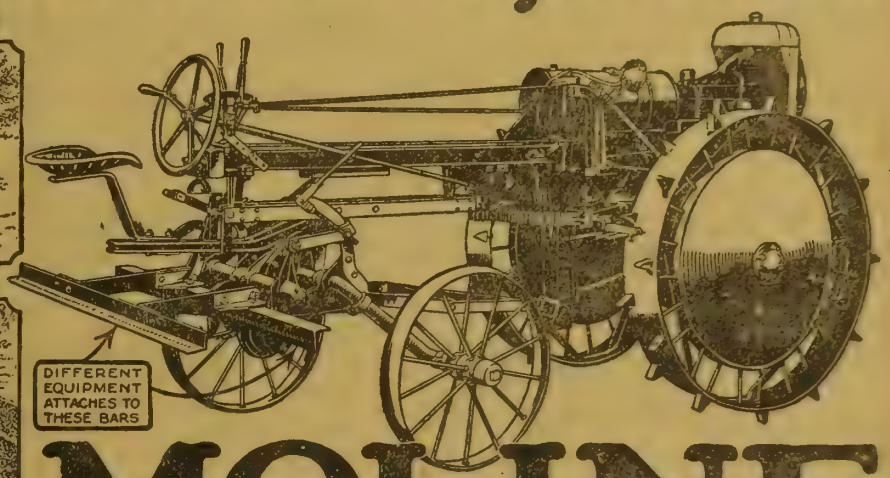
Two generations of from 300 to 900 in a brood is the annual record in Massachusetts. The last brood of the year winters over in nearly full grown worm form well housed in some food plant. As the warmth of spring touches them the worms wake up, and after a brief further feeding within their burrow attain their grown up stage, and then curl up in chrysalis to win their wings. This period of probation, or of pupation, to be truly scientific, is of but two weeks' duration, whereupon there emerges along late in May a rather pretty little reddish brown or pale yellow moth, with a wing spread of an inch or a trifle more. The brown moths are the males. Another fortnight on the wing and this generation has done with life, its eggs having been laid on the food plants round about. In less than a week, however, generation number one for that year breaks free from the shell, and the destructive feast is on once more, the young worms first feeding on the tender shoots, boring down into the stems as they gain in strength. In a month and a half of ruinous gorging the worms have come to maturity, curl themselves up as their sires did before them, and late in July the moths once more appear flitting about the field. Where the parent moths of the spring were content to lay the foundations of families varying from 300 to 700 in number, this midsummer host is more ambitious and from 600 to 900 eggs to a batch are the common figures. And just as they are more numerous, so are these worms more destructive, so far as the corn is concerned, for they romp at once into both tassel and ear, and keep up their feeding until checked by the early frost.

GREASING THE WAGON

Short cuts, or elimination of details, have aided many a farmer in reducing costs and making his place pay while otherwise there might have been a loss. We have from W. F. Cook of Orosi his method of greasing a wagon which, he says, makes a material saving. It looks to us as if there might be danger of losing his wheel and dropping the spindle in the dirt. However, we give Mr. Cook's method as he sends it.



"First, take off all the burrs. Take hold of end of tongue and swing back and forth a few times to spread the wheels. Take hold of hind end of rack or box and spread apart by giving a few shakes sideways. Do not spread wheels more than two or three inches as you may have trouble in getting wagon back together again.



"Now grease the side that is spread apart. Go to opposite side and push the wagon over so as to make room to grease. Now put on burrs on first side greased. Go to other side and take hold of rack. Put both feet on spokes near hub and give yourself a few outward swings and you can pull the wagon together again. Of course the wagon should be on firm ground. If a little sidling so much the better if you put burrs on high side first as the pulling together will then be down hill.

"This is the easiest and best method I know of. If any of your readers have a better way please send it along. I used to have wagon jacks which I thought necessary, but since I learned how I have no use for a jack to grease a wagon.

"Another item while I am on this heavy wagon line. If your old wagon is hard to guide (binds in the bolsters), take an old rolling coulter blade, knock off the hubs, put under bolster and see what a difference it will make. A little axle grease will help but it will turn much easier on the steel."

One Tractor and One Implement For All Orchard and Vineyard Work

MOLINE UNIVERSAL TRACTOR and ATTACHOR

With this one outfit the orchardist and vineyardist can do practically all their work and one man can do much more work at less expense than ever before possible.

The Moline-Universal Tractor Attachor is made to work in connection with the Moline-Universal Tractor so that one man has control of both tractor and implement. It consists of an attachor truck equipped with a power lift device and a pair of transverse bars to which can be attached the following equipment: Orchard Gang Plow, Offset Sulky, Straight Sulky, Orchard or Alfalfa Cultivators; Spring Tooth Harrow in two, three or four sections, Furrow Irrigator for orchard or vineyard work, Ridge Irrigator, Vineyard Gang Plow and Crust Breaker.

Thus this one implement does away with all special tools which are used for only a few days out of the year. The Moline-Universal Tractor Attachor combines the main parts of all these machines such as wheels, axle, frame, lifting device, seat and control mechanism. The saving in expense is apparent.

But the improved quality of the work which can be done with the Moline Universal outfit and the saving in time *is* of greater importance.

For orchard plowing the gang plow is used and the land is plowed as close as the branches of the trees will permit. Then the Offset Sulky or the Straight Sulky is attached in place of the gang plows and the last furrow or two are plowed out right up to the tree trunks. Plowing can be done away from or to the trees in this manner. After plowing the Orchard, the Cultivator or Spring Tooth Harrow can be readily attached for making a fine mulch. And if irrigation is practiced, furrows or ridges are quickly made by attaching this equipment.

For vineyard work, Moline-Universal Attachor enables a better quality of work to be done, and quicker and cheaper than ever before possible. The vineyard plow consists of a pair of right and left hand bottoms. These bottoms can be spaced wide apart or close together to suit any vineyard rows from 6 to 10 ft. apart. In two operations, with the bottoms spaced wide and close together, all the land can be completely plowed between the rows. Then by using Spring Tooth Harrow and Furrow Irrigators the entire vineyard work can be finished completely.

The Moline-Universal Tractor is especially well adapted to orchard and vineyard work, being light in weight, extremely powerful. All moving parts are fully protected from dust and many other features which other tractors do not have. Aside from this work it can be used for any farm work, including cultivation of row crops and for belt work.

This Moline outfit will make you more profit. If you are interested in orchard or vineyard work, send for folder R. F. No. 84 which explains in detail just how the Moline-Universal Tractor and Attachor are used.

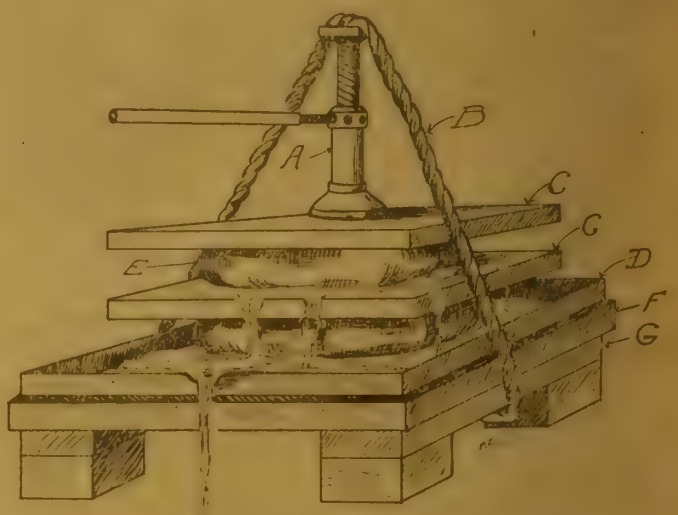
Home Made Olive Oil

Written for California Cultivator By W. V. Cruess

THERE is no thoroughly satisfactory way of making olive oil upon a very small scale without expensive machinery. Where one has only a few Mission or Manzanillo olives, it will be better to make them into olive pickles in the way recently described in these columns. However, a number of growers have a few trees of an oil variety of olive, the fruit of which is unsuitable for pickling; or others may have a quantity of badly frosted fruit that will not make satisfactory pickles. All such material can be made into oil. It must be realized that the methods described below are the best that we have been able to find or devise for small scale use, but that the yields of oil when compared with commercial factory yields are low. The necessary utensils can be found on any farm.

Extraction of Oil Without Pressure



A pound or two of ordinary lye, such as Babbit's, Red Seal or Greenbank's lye, will be needed. Make up a solution of the lye of one-half pound of the lye per gallon of water, using an agate ware or iron pot. Do not use your aluminum ware; it will dissolve in the lye. A small basket of wire screen such as is used for making French fried potatoes will be needed or a piece of cheese cloth can be used.

Heat the lye solution to boiling and while it is boiling dip the olives in it for about 20 seconds. The time will vary with the toughness of the skins. Leave the olives in the lye until the skins are softened; that is, practically dissolved. Then plunge them into cold water for a few seconds to check the action of the lye.

Place the lye treated olives on a piece of fly screen tacked to a frame over a large dishpan. Rub them on the screen until the flesh has separated from the pits and dropped through the screen into the pan. A heavy pair of gloves is useful in this process to prevent the hands becoming badly stained and roughened by the lye and olive juice.

Place the pulp, which should now be of a pasty or mushy consistency, in a pot with about two or three times its own volume of water. Heat with stirring to the simmering point for about one-half hour. Set aside for several days to permit the oil to rise to the surface. Usually a fair yield of oil can be obtained by skimming it from the surface of the pulp. The pulp may then be heated to boiling a few minutes with more water and allowed to stand again. The process should be repeated several times. We have obtained about two-thirds the yield of oil by this process that can be obtained by use of a commercial press. The secret of success lies in rubbing the olive flesh to a fine grained pulp on a screen.

The oil obtained by this process must be washed and should be filtered as described later in the article. It has been found that the yield of oil is sometimes increased by adding about one-fourth pound of salt per gallon of water used with the pulp. Always use a large excess of water with the pulp as this facilitates separation of the oil.

Home-Made Olive Oil Press
Plan and drawing by Prof. W. V. Cruess. Specifications in Prof. Cruess' article.

Home Made Olive Press

A simple press made from materials usually found about the place is shown in the accompanying figure. This press has been described by F. B. Pinkus in the Olive Journal. The

A Big California Olive Oil Mill

Such a powerful mill and big press as is shown in the background is not possible in home making of olive oil but this illustration gives an idea of the industry as conducted in this state.

writer has made several modifications in the original plan of the press.

"A", heavy wagon or automobile jack. "B", small iron or steel cable or chain or heavy rope. "C", two pieces 2x12x12 inches. "D", shallow wooden water tight tray. "E", heavy burlap cloth to hold crushed fruit. "F", floor of 2x12 inch material. "G", 2x4 inch braces. The tray "D" and floor "F" are 16x16 inches.

One of the greatest difficulties to met will be the crushing of the fruit. This may be done as described for the method above. If this method is used, return the pits to the olives before pressing. The olives may also be crushed by placing them in a strong sack and by hammering the sack with the broad side of an ax or with a heavy board in the same way that ice is crushed in a sack. The fruit must be thoroughly broken up. It will crush better if it is boiled a short time to soften it.

Place the crushed fruit and pits in a piece of heavy burlap and fold the edges of the burlap in to give a press cake about 10x10 inches and about four inches thick. Make two of these and place them in the press as shown in the figure. Press slowly until no more juice can be obtained; save all juice and oil pressed from the fruit. The pressed pulp should now be boiled with an equal volume of water and pressed again. This pressed pulp should again be boiled and pressed. Usually a fourth heating pressing will pay. Combine all of this pressed liquid and allow it to stand in a tub or barrel over night. The oil can then be skimmed off.

Washing the Oil

Oil obtained by either of the above methods will be bitter and not clear. It must be washed with water to remove the bitterness and rough flavor. To do this first prepare a bucket or five-gallon can with a hole and faucet or cork near the bottom. Place the oil in this container and add an equal quantity or more of warm water. Mix oil and water by stirring for several minutes. Allow water to settle several hours. Draw off the water and replace it with fresh warm water. Stir; settle and draw off after several hours. Repeat until the oil no longer has a bitter taste. Usually two days' washing will be sufficient.

Filtering the Oil

The oil will be cloudy and mixed with a little water. It can be made clear by filtration. A tin funnel can always be bought from the hardware store. One about seven inches in diameter is a convenient size. Filter paper can be bought from the drug store. Ask the druggist to fold the paper for you and tell you how to place it in the funnel.

Place the funnel in a wide mouthed bottle or place a 1x3 inch piece of wood over a bucket and bore a large hole in the wood to take the stem of the funnel easily. Pour the oil into the filter paper in the funnel and allow it to filter. Oil filters slowly; do not become discouraged if it requires several days for it to run through the filter.

Aging the Oil

Olive oil is not fit to use as soon as it is made. It should be kept for at least one year before it can be expected to have the proper flavor. Keep it in well cleaned bottles away from bright light. Too much light will cause it to lose color and flavor. A warm room will cause it to age more rapidly. The oil will also age more rapidly if the bottles are only three-fourths full and if a small piece of cotton is used to close the bottle.

Oakland

In no small measure is the present high esteem enjoyed by the Oakland Sensible Six due to the American farmer. Brought to this car early in its career by his desire to possess something better, it has been the farmer who has put it to the most strenuous and varied usage, demonstrating most spectacularly its capacity for continuous and economical service. In return the Oakland Sensible Six has everywhere well repaid the farmer, by a measure of usefulness and constancy not outdone by any other mechanism within his experience. Over the roughest roads, throughout the severest weather and under the hardest conditions, it has carried him and his in comfort and safety wherever business or pleasure has commanded.

There is no other type of vehicle so comfortable or convenient as the Oakland Sensible Six Sedan. Powered with the famous 44-horse-power overhead-valve Oakland engine, it is from 300 to 500 pounds lighter than comparable closed cars, and it returns mileages of from 18 to 25 per gallon of gasoline and from 8,000 to 12,000 on tires.

This Month in the Vegetable Garden

Northern California

Written for California Cultivator By A. R. Gould

A PROSPEROUS New Year to all readers of this calendar, and it is the sincere hope of the writer that the bountiful rains which appear likely to extend over the next few months will enable this wish to be fully realized. Practical knowledge will also help and we shall endeavor to impart that which has proven best in our past experience. Garden preparation has been possible at intervals through the past month and the ground, although in many sections it has been well soaked, was not unworkable. Altogether it is much easier to dig and plow, and many crops such as carrots, onions, etc., may be thinned out with considerable ease. Where the peas were sown on the sloping ground and in a sheltered position, being well drained, they are making excellent growth and early crops will be the result. The frosts in most sections have been very severe and the lettuce has been slightly hit, at least the outer leaves of the large headed varieties, but where a slight covering of straw was given it is intact. It is a good plan to construct a few frames of rough boards in which to grow some lettuce during the winter months, as these frames can be easily covered with cheesecloth or other material. Where possible these frames can be made up on a foundation of farmyard manure, which will supply bottom heat. Several inches of soil should be placed on the manure. Such a structure is of value in every garden, not only for raising lettuce but for other subjects besides. Where plots have been recently cropped and are now being dug or plowed for future use it is advisable to leave them in the rough state for several weeks to allow the air and frost to do their work, as the value of these agencies are all important, and furthermore avoid all work on heavy soil if it becomes at all "sticky" after a rain, as soil once "packed" is hard to get into working condition again, and there is nothing to be gained by being in a hurry. Study your soil conditions. Sandy soils are not so much affected, naturally. In view of the severe frosts we are yet likely to experience we advise that sowing of lettuce be deferred for a month at least.

Carrots

It will be possible to sow the early French forcing variety in rows 16 inches apart and if a frame is available on the hotbed of manure, soil may be filled in on this several inches deep and the seed of this same variety sown very thinly in rows nine inches apart. By this method you will be able to raise a very early crop of carrots. If the frame can be covered with glass for a few days germination will be assisted, but, failing this, some other covering can be used. The frame should be placed in a warm sheltered position.

Turnips

Sow thinly on well prepared soil in rows 18 inches apart. Extra Early Purple Top Milan, White Egg and Early Snowball—any one of these are good varieties.

Onions

The main crop varieties as advised last month, Ailsa Craig, Prizetaker, etc., should be sown without delay, and where the early varieties are well through the ground and the weather and soil conditions permit, the soil between the rows should be stirred with the hoe. This will also be a good month to transplant seedlings of the early varieties which have to be thinned to five or six inches apart.

Parsley

A successional sowing of this may be made at the end of the month, using the variety Moss Curled. Sow this around the edge of the garden plots.

Peas

Successional sowings of Stratagem, Senator, Little Marvel, and Alaska should be made at the first favorable opportunity between the rains. Where a tall variety is required, which must be staked, Telephone is recommended. Melting Sugar, an edible podded variety, is of the same type and is very popular with some.

Southern California

Written for California Cultivator By D. F. Reichard

OUR Victory Garden year is at hand. The preliminary rains have been most effective and the weather ideal. Conditions are right for all to have their gardens; most satisfactory for many a year. This is our opportunity to help the food administration to supply the 20,000,000 tons of provisions for the hungry, ill fated people of Europe.

Everyone who has any vacant land and a few minutes a day should grow something; if not vegetables for human consumption, grain or coarse vegetation for feeding animals and poultry. Grow flowers to cheer those who do not have a garden or time to work in one.

Anything we use or consume that is produced by ourselves is just that much more left to go overseas. Even though the cost of home grown stuff is more (it should not be) than that purchased on the market, the fact remains that you are detaining the delivery of food to starving people and should induce us all to plant and care for as much garden as possible.

The first step in planting a garden is the preparation of the soil. This is accomplished by thoroughly working and pulverizing your ground to a depth of at least ten inches, fifteen inches is better. If your soil is heavy and of a clayey nature, each year work into it roughage of different kinds and lime, sand and ashes. These all tend to break it up and after a few years' you will be surprised at the improvement. Any part of the garden that is not planted should be kept cultivated deeply to keep the soil in shape and clean for the reception of seeds and plants when the time is right to put them in. Always cultivate as soon as the ground will break up nicely after a rain storm or an irrigation so as to keep the top soil in pulverized condition. If your plants need more food than your soil naturally supplies it is advisable after the plants get started to apply commercial fertilizers. This will help out the

present crop but next fall it will be well to keep the condition of your soil in mind and just before the rainy season put on a good dressing of coarse manure to be worked in later.

During January planting should be confined to the warmer valleys where a wide range of vegetables should be put in. Plant Early Egyptian beets, Swiss chard and stock beets; Half-long and Oxheart carrot; Los Angeles Market, Cos and Cream Butter lettuce; radish, onions and turnips in variety; Giant Amsterdam spinach and Stratagem or Senator peas. Sow seed of Cannon Ball and Winningstadt cabbage and early cauliflower for setting out later.

Set out plants or roots of asparagus, artichokes, horse radish, rhubarb, cabbage and cauliflower and berry plants and dormant trees and vines.

In protected spots plant Canadian Wonder and Ventura Wonder wax beans.

Keep growing plants cultivated and hoed. Watch for any insect or disease. As soon as they appear spray them with the proper material for their destruction.

This Month in the Ornamental Garden

Northern California

Written for California Cultivator By A. R. Gould

IN THIS department much cleaning up and digging will be necessary and very few idle moments will be found except on rainy days, and even then seeds may be sorted over in the garden shed and various tubers examined such as dahlias, gladiolus, begonias, etc., which are being stored, and these must be closely inspected for any sign of disease which may be cut out in its early stage. See that they are kept in a dry place.

Where it has been possible to prepare for laying new lawns and the weeds have been given a chance to show up, after the surface has been well prepared the seed may be sown, and should be well raked in. Soil should be made ready for seed sowing in boxes and frames of summer flowering subjects. The mixture should consist of garden loam, leaf soil and sand. This should be placed under cover from the rains and the shallow boxes or pots may be filled as required.

Tree Seeds

Many people derive much pleasure from raising various trees of an ornamental nature from seed, and while we would not recommend our readers to try any subject, yet there are a few which we shall name here that are fast growing and may be raised in boxes or pots in a mixture of soil such as we advised above. Pepper tree, acacia Baileyana, A. latifolia, A. lopantha, A. mollissima, eucalyptus globulus, E. citriodora, E. obliqua, E. robusta, E. ficifolia, E. crebra, and many other eucalyptus, cupressus arizonica, C. macrocarpa, C. pyramidalis (Italian cypress) and pinus insignis. Some of these subjects take quite a few weeks to germinate and need careful watering. Never make the soil too wet, and the seeds must be sown thinly. After the seedlings are showing through, moderation in watering is even more essential as damping off will result otherwise. Pots sown with these may be placed in a sunny window in the house, and as these young trees develop they will prove interesting to all the members of the family. To the children especially they should provide an object lesson in nature study, while there is also a place for these in the school windows.

Double Hydrangea

A few days ago we saw a very choice double type of hydrangea in a nursery. This should prove a useful novelty. The nurseryman informed the writer that it had developed amongst some French hybrids. The color is a pleasing pink. These shrubs are ideal for a shady position but while growing under large trees it should be remembered that frequent applications of manure must be given as they will always repay for rich soil conditions and in the summer they need lots of water.

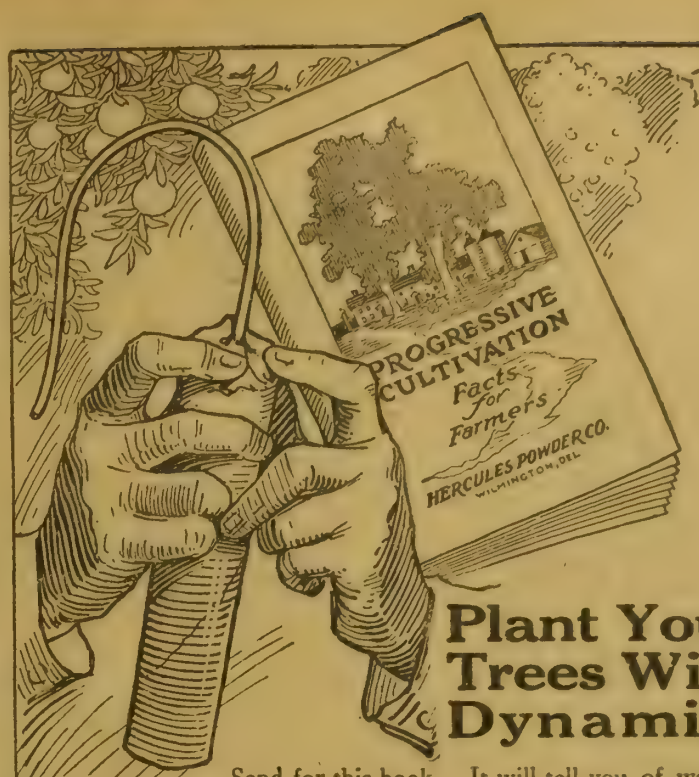
Roses and Flowering Shrubs

Now is an excellent time to prepare for planting new roses, and the beds or borders should be deeply trenched and manured for them. Plant firmly. Only the best varieties should be secured. Hoosier Beauty, Sunburst, Lady Hillingdon, Los Angeles and Mad. E. Herriot are all good roses. Amongst the flowering shrubs spirea Van Houttei, S. Billiardi, weigelia candida (white), mock orange (very sweet scented white flowers), laburnum, lilacs, forsythia suspensa (golden bell), are all very useful and easy to grow.

Conifers Which Are Choice

If single specimens are desired it will be necessary to plant 30 to 40 feet apart. Among the spruce the very best we have seen for a long while is Abies excelsa aurea, the "Golden Spruce" or fir. Abies pinsaps has glistening cones which look beautiful, while Abies noblis glauca is the silvery red fir. A conifer always admired is Picea pungens glauca, the Colorado blue spruce, also Picea Kosteriana pendula, the weeping blue spruce. The junipers, such as juniperus japonica aurea, a small creeping shrub, and J. virginiana glauca, somelarger, are very pretty. The thuya or arbor vitae, T. gigantea aurea and T. orientalis pendula are well worth a prominent place in the home garden. They may be planted any time this month.

Propagating



In sandy soil on a warm border or in boxes insert cuttings or slips of Mesembryanthemum roseum, Vinca variegatum, varieties of ivy, hydrangeas, box, privet, fuchsia and roses. Plant these firmly.

ORANGE COUNTY TRACTOR COURSE

Santa Ana has been selected as one of the 36 centers where short practical courses for the training of all interested in the repair, upkeep, and operation of farm tractors, gas engines and farm implements will be given.

These courses have been arranged for by the state board of education and the state board of control.

The date fixed for the Santa Ana center is February 10 to March 1. The first two weeks of the course will be devoted to assembly, repairing and dissembling gas and tractor engines, tractors and farm machinery, carburetors and batteries, and to trouble finding and engine operating. The last week of the course will be given up to supervised experience in operating field tractors and other machinery.

Plant Your Trees With Dynamite

Send for this book. It will tell you of ways in which you can save days of back-breaking work by using dynamite on your farm. *Send for it today—you can't get it too soon.* You will need it before you plant that new orchard.

HERCULES DYNAMITE

is one of the most valuable helps to the farmer and orchardist. With dynamite you can *blast* the holes for your new trees instead of digging them in the old fashioned, laborious way. With it you can cultivate your old orchards by blasting between the rows. It will dig your ditches and clear your stump land.

Sign the coupon printed below and mail it to us *now* and we will send you a copy of our 68 page, illustrated book, "Progressive Cultivation." This book has been an invaluable help to thousands of farmers and orchardists by telling them of the many ways in which dynamite can be used on the farm. Send for it and let it help you to lighten your labors and swell your bank account.

Questions and Answers

ANSWERS BY EDITOR AND STAFF

Questions to be answered in this department should be received at the office one week before reply is expected. Write plainly on one side of the paper and sign full name and address. Unsigned communications receive no attention.

Literature on Fig Culture

Where can I get books or bulletins on culture of figs?—Subscriber, Fresno.

There is no book published on fig culture in print, though we may refer to "The Smyrna Fig at Home and Abroad," by George C. Roeding, Fresno. This was a very valuable 88-page book but we believe is now entirely out of print. Mr. Roeding also published in 1914 a circular on the fig which contains valuable information. In addition we may refer to Bulletin No. 9, "The Fig, Its History, Culture, and Curing," by Gustav Eisen of the Division of Pomology, U. S. Department of Agriculture. This was published in 1901 and is also out of print. The Arizona Experiment Station has issued Bulletin 77, "Practical Fig Culture in Arizona," by W. H. Lawrence. The address of the station is Tucson, Arizona.

Forcing Ration

Please give me a formula for a forcing feed. Some of my hens are going on three years old. The first year they did very little, as I was not here and they got little care. Last year they did very well. I want to feed them to get all the eggs possible and then sell them.—Subscriber, Dos Palos.

There is no better forcing ration than that used at Storrs, Connecticut, in the fifth annual International Egg Laying Contest. The mash consisted of equal parts by weight of wheat bran, corn meal, ground oats, flour middlings and meat, the meat being equal parts beef scrap and fish meal. The scratch grain was equal parts by weight of wheat and cracked corn. If you cannot get flour middlings—and you probably cannot as yet—you might substitute equal parts ground barley and soy bean meal—J. A. K.

Chicks Peck Each Other

I have 100 chickens, Rocks, Reds and Orpingtons, about four weeks old, and very suddenly they began pecking one another on the heads and would peck the heads until they were perfectly raw. The moment they get a taste of blood they seem to go wild and there seems to be no way to stop them. What causes this and what can one do for it?—Subscriber, Woodland.

The best way to stop your chickens pecking at each other is to get them out on good range where they will have something else to do. Possibly it is a lack of animal food that makes them begin pecking; maybe it is pure idleness. In any case, see that they have good pure beef scrap in their mash and room to run. You will have to put the chicks with raw heads by themselves till they are well. Perhaps you will need to protect them even from one another. A thick salve, like resinol ointment, is good for this purpose. Chicks of the heavy breeds do not fight and peck each other unless there is some reason. Either they are crowded or they lack animal food or their run is so bare that they peck at one another for lack of other occupation. Keep them busy and properly fed and you should have no more trouble.—J. A. K.

What Poults Need

"Curd is not necessary in raising young turkeys, neither are onions," writes a Dos Palos subscriber. "I had neither, and out of 25 birds hatched I raised 16."

No, no particular ration is warranted to bring poults through that first critical three or four months. It is not a question of what, but of how much. The Rhode Island station is quite emphatic on this point. There was a time when the experts at this station considered curd almost absolutely necessary, but their most recent conclusion is: "We are not in a position to state that one food is essentially better than another for poults that are on range. Vigorous flocks have been raised on corn meal alone, while equally good flocks on a neighboring farm have never tasted it; and on another the sole ration for the young birds is bread and milk, which gave equal success. In none of these instances is it the kind of food that counts so much as the manner and amount in which it is fed as a supplement to the food obtained on range. The successful turkey raisers of the present day—and they are few in number—are those who understand the feeding of turkeys from the quantitative point of view—who have succeeded in adapting a certain method of supplementary feeding to the conditions existing on their particular range."

Old Hens for Breeders

I have some very fine three year old hens. How long can I keep them for breeders?—Subscriber, Dos Palos.

It depends to some extent on the breed. Orpingtons, Rocks and other heavy hens are apt to become so fat by the time they are three years old that it is hardly worth while keeping them. Leghorns should be valuable breeders a year longer. As long as the hens lay well they ought to be good breeders. But few poultrymen keep a hen more than three years unless she is an exceptional bird.—J. A. K.

Deciduous Orchard

Kindly give me list of deciduous fruits, say 20-25, best adapted to growing in the foothills of La Canyada.—Subscriber.

It is not usually best to plant too many varieties of fruit. If the planting is for market the varieties should be limited to those that sell best in that market and ripen at such time they will not have excessive competition from other localities. When there are too many kinds there is not enough of any one kind to supply a demand which may be worked up.

Of the apricots the Royal is the best all round variety though the Blenheim is a good second. Summer apples can be grown if plenty of water is supplied in irrigation. The Red Astrachan, Gravenstein and Fall Pippin will succeed. Peaches are subject to "late dormancy" in many places, which causes loss of crops, those of southern origin being best adapted to our conditions. The following will be found among the best: Early Crawford, Late Crawford, Elberta, Henrietta, Phillips Cling, Yellow Tuscan (cling), Salway. The Bartlett pear is the best for all purposes. The Satsuma is the surest of the plums. The Pineapple quince is the best flavored of the quinces and can be cooked for sauce like an apple.—J. B. N.

Assuming that the inquirer may have desired a family orchard we may add that according to our idea the first consideration is to plant those fruits which may not be secured on the market in freshest and best condition, that is, fruits like figs. Where one enjoys figs as does the writer he would plant one or two of the black varieties, San Pedro or Mission, a White Adriatic, one of the small so-called Smyrnas or honey figs. The Kadota is also an excellent table fig.

Apricots are also much nicer fully ripened on the tree. Royal and Moorpark would perhaps give all the variety desired.

Peaches should be in every home orchard. Some varieties like the Briggs Early May are not of exceptionally high quality but are of the earliest. The Hale's Early comes early in July, as does the Strawberry, a small pink peach with white flesh, red about the pit. Then comes the Early Crawford, the Elberta, the Foster, Muir, Lovell and Salway. If one likes clings for canning the Phillips and Tuscan are among the best.

One should have a few plums. Amongst the earliest are the Burbank. Clyman, Early Golden Drop; and these may be followed by Green Gage, Kelsey, Satsuma, Santa Rosa, Wickson and Yellow Egg.

Then there is that combination of peach and plum, the nectarine, which always needs to be fully ripened on the tree. There is the white and the

red; one of each should be planted.

One should have a collection of grapes, dewberries, raspberries, logans and blacks.

Amongst the early fruits are the loquats, of which there are some exceptionally fine varieties.

Where conditions are right the growing of the avocado may give fruit the year around if right varieties are chosen.

The persimmon not only yields a fruit acceptable to most of us, but makes a strikingly beautiful tree in the fall after the leaves have dropped leaving branches covered with the brilliantly colored fruit.

In apples Mr. Neff has given a good list, but in most valley sections only the Astrachan or some early variety succeeds.

One of the handsomest trees of all is the California walnut which affords magnificent shade in summer and nearly always proves a most profitable tree as well.

Olives in San Diego County

As a reader and admirer of your paper I would like to ask your opinion on olive culture in San Diego County. As I have on my farm some steep but very deep and fertile hillside soils which would undoubtedly grow good olives, I would like to ask your opinion on same. Do you think it would be a profitable thing to do? Do you think the olive market will average good for the next 15 years? In your opinion which would be better, to plant oil or pickling olives?—Subscriber, San Marcos.

The olive is a native of southern Europe, and since the California climate is similar it will do well wherever there is sufficient moisture and suitable soil conditions. The soil should proferably be loamy and deep. While the olive requires less water and its roots will reach farther for moisture than most fruit trees it must have sufficient moisture, either from irrigation or from a retentive soil which will hold the winter rains. If it is expected to grow the trees without irrigation it will be better to plant trees of which the roots have been grown from seeds and then grafted or budded. These have better root systems which will reach farther and deeper for moisture than the roots of trees grown from slips. Do not plant too closely. Thirty feet apart is close enough where water can be supplied and as much as 40 feet apart under more adverse conditions. There must be cultivation to conserve moisture in the dry season as well as to allow the winter rains to penetrate the soil, which might not be practical on very steep hillsides. You can determine from the foregoing whether your conditions are suitable. There will undoubtedly be much more olive oil imported than has been in the last four years but there is no reason now apparent which would make the business unprofitable. Plant selected strains of Mission olives as the large olives can be used for pickling and the small olives for oil.—J. B. N.

Trees for Heavy Wet Land

I am a subscriber to the Cultivator and learn many things from the "Questions and Answers" column. May I ask a question? I have a piece of land near an irrigation ditch; this land is red, sticky clay-like adobe, free from alkali. The moisture stays in it all the year excepting the three hot summer months, July, August and September. It is rich but just always wet, even very boggy at times in driving the team over it. I wish to ask, "What kind of trees would be adapted to this, as it is a portion of my lemon orchard—no frost—I wish to cultivate this piece and also have my tree rows of the orchard even.

You do not say so, but we presume the seepage from the irrigation ditch has something to do with the excessive amount of water in your soil. As a preliminary operation we would suggest that the ditch banks and bottom be made water tight. If that is not sufficient tile drains should be put in deep enough and close enough to take off all the surplus water. You say there is no alkali in the soil, but it is likely an application of four to ten tons of gypsum to the acre will be very beneficial in improving the texture of the soil after the surplus water has been removed or prevented from returning. Plow deeply and turn under large quantities of straw or any strawy material. Keep the surface well cultivated and we think you will have no trouble in getting lemons to grow. We do not know any tree that would do well under present conditions.—J. B. N.

Curing Chili Peppers

How are chili peppers dried? What kind of dryers are used; how much do they cost; what kind of fuel should be used?—Subscriber, Bostonia.

The curing of chili peppers was formerly done on strings suspended from any convenient place in the sunshine, and as many as half the chilis were often lost by decay if the weather was unfavorable, but the industry has grown to such proportions that drying plants costing as much as $20,000 can be found, and at least one grower and dealer in the Garden Grove district will handle from 600 tons to 700 tons of cured chilis this year. The houses used are low buildings varying from 20 feet by 30 feet to 30 feet by 60 feet inside and all in one room. An excavation from five to seven feet deep—the deeper preferred if the soil is free from surface water—and arranged with furnaces and ventilating tubes to receive the cold air which after being heated passes up through the chilis and out through ventilating pipes extending above the roof. The drying is done on trays seven feet by two feet made of one inch by two and one-half inch redwood covered with wire netting known as one-inch chicken netting. These have at least one cross piece same size as the ends of tray to add strength to the tray. The floor is open and the trays are arranged in tiers with the end of one tray slightly overlapping the tray below so as to secure free circulation of the heated air. The end trays in the tiers are supported by extra pieces of one by two and one-half inch laths. These tiers of trays, after having a layer of chilis spread over them, are built as high as the cross beams of the house, which is usually about nine feet. The houses are built with double board sides having paper between the boards. Shingle roofs have been found to be the best.

Natural gas is the best and cheapest fuel, but low grade distillate, known as stove distillate, is used where gas is not obtainable and is burned in a special burner. The drying is done at a temperature of from 125 degrees to 130 degrees and requires from five to seven days to cure the chilis, depending on the ripeness of the chilis

Reliable Market Reports for the Asking

Written for California Cultivator By F. P. Allen
Representative United States Bureau of Markets

AMONG the many activities of the United States department of agriculture in California as well as in all other states of the Union for the improvement of all lines of agricultural pursuits, the bureau of markets plays an important part.

Occupying a suite of rooms in the International Bank building in Los Angeles, the live stock and meat division of this bureau, located in the heart of the wholesale and retail section of the city and connected by leastd wire with San Francisco, Portland, Salt Lake City, Denver, Kansas City, St. Louis, Chicago, Washington, D. C., and all of the large Eastern cities, the bureau is in hourly touch with the live stock and meat market variations of every market center of the United States.

Local representatives of the bureau of markets in each of these cities assemble market information on both live stock and meats and this information is telegraphed on an "open wire" to be received simultaneously by every office in the circuit, including Washington, D. C. General marketing conditions and prices paid for live stock and meats thus obtained and assembled are arranged in bulletin form, published and dispatched to those interested in the industry with the least possible delay.

Every division superintendent of every railroad in the United States, each night in the year, including Sundays, telegraphs the number of cars of live stock loaded or passing through his division, to the Chicago office of the bureau of markets. This telegram shows the number of cars of each class of stock, their shipping origin and their destination. These figures are compiled by the bureau representatives and at 4 a. m. Chicago time are sent over the leased wire to all bureau of market offices in the United States. The local representative then publishes these figures in bulletin form, known as "Destinations of Live Stock Loaded" and "State Origins of Live Stock Loaded." This information is of great value to shippers of live stock as it enables them to determine when best to ship their own stock to market in order that it will not arrive at a time when the market is congested with supplies.

A bulletin entitled "Daily Report of Meat Trade Conditions" which includes the local, San Francisco, New York and Boston market conditions, is released at 8:30 a. m. each market day. The information and prices obtained for this report are based on actual transactions that have been consummated on that market. Unlike the former commercial method of reporting the daily market prices when the figures were obtained from one of the largest establishments in the city whose individual point of view alone was expressed and whose selfish interests were advanced by placing the figures at a high or low level, whichever served his purpose best, the bureau of markets prices are taken from the entire market, unbiased and dependable and in the interest of everyone connected with the industry.

On Friday of each week after the close of wholesale meat markets a brief yet comprehensive review of the market for meats is published in the form of a bulletin entitled "Weekly Report of Meat Trade Conditions." This report is valuable not only to the wholesalers and retailers of meats but to the producers as well. It enables them to follow the upward and downward trend of the market for the finished product and serves as a guide to the producer in the finishing and marketing of his stock.

The "Live Stock and Meat Trade News," a weekly report, is released for publication every Thursday. This bulletin is made up of items contributed from offices of the bureau in various parts of the country. It tells of the in and out movements in the feeder districts, of breeding, feeding and marketing live stock in various localities. Briefly, it has items of interest on every phase of the live stock and meat industry.

"Live Stock at Stock Yards," a ten page monthly publication, is released about the tenth of every month. This report shows the number of cattle, hogs and sheep received at 71 live stock market centers, the out shipments, the local slaughter and the stocker and feeder movements of these cities. A comparison with the same month one year ago and a recapitulation of the entire receipts and disposal of this stock is made.

Monthly reports of cold storage holdings are issued in two forms. One of these forms, known as "Summary of Cold Storage Holdings," is received by wire soon after the end of each month and includes the reports of from 350 to 575 cold storage establishments in every part of the United States. Under the heading, "Frozen and Cured Meats," the number of pounds of the following food products held in all cold storage houses are shown; frozen beef, cured beef, lamb and mutton, frozen pork, dry salt pork, pickled pork, lard and miscellaneous. Under the heading, "Frozen Poultry," the number of pounds of the following classes are shown: broilers, roasters, fowls, turkeys and miscellaneous. Cold storage holdings of dairy products include creamery butter, P. S. butter, American cheese, case eggs, frozen eggs, Swiss cheese, brick and Munster cheese, Limburger, cottage cream and neufchatel cheese. Storage holding reports also include fish and apples. The other form of cold storage report is a detailed statement of all cold storage holdings of every food commodity shown in the summary, and comparisons with the same month one year previous, and also two years ago.

Any one or all of the foregoing named bulletins are for free distribution to whoever they will benefit.

Every market day in the year messages over the leased wire are received from Chicago, Omaha, Kansas City and St. Joseph at 6:00, 7:00, 8:30, 9:15 and 10:30 o'clock and the close of the market at 1:30 p. m., central time, giving the estimated receipts of live stock at these markets, the actual receipts of the day before, the hold over of hogs, the market conditions and prices on all grades and classes of live stock at these hours of the day. This information is available at 12 o'clock noon, Pacific time, in the local office of the bureau of markets, and can be obtained by telephone on or after that hour. The data of these telegrams are gathered by the bureau of markets representatives in the cities named and are furnished to all commercial news agencies and press associations throughout the country.

The local representative of the bureau has aided some associations of live stock producers in their effort to work out a plan that will be an improvement over former methods of marketing live stock in Los Angeles. A tentative plan for the establishment of stock yards in Los Angeles is nearing completion.

Under the provisions of authority conferred on the president of the United States by an act of congress approved August 10, 1917, the bureau of markets, under the direction of the secretary of agriculture, has been designated to govern and regulate public live stock yards, and the handling or dealing in live stock in connection with stock yards. That the bureau of markets will govern and regulate the stock yards located here, as elsewhere, along lines of square dealing and in the interest of all concerned, needs no comment.

In addition to the above reports, the bureau issues a "Quarterly Wool Stock Report." This report shows the available supply of wool held by wool dealers and textile wool manufacturers in the United States on March 31, June 30, September 30 and December 31, tops and noils, in all of the generally accepted commercial grades, combing and clothing, in both domestic and foreign. The report shows the stocks held by manufacturers in the leading textile manufacturing states and the amounts held by dealers in the principal wool makets of the country. The "Monthly Wool Consumption Report" shows the amount of wool in the United States which entered into the process of manufacture during the month, in pounds of grease, scoured and pulled wool, in all the various commercial grades, combing and clothing, in both domestic and foreign. It also shows the amount of wool consumed in the principal textile manufacting states, in pounds of grease, scoured and pulled wool. The "Monthly Report of Wool Machinery" shows the number of active and idle machines in the United States and the number engaged in government work as reported by wool manufacturers.

As stated above, any or all of the reports referred to are available for free distribution and will be mailed to all who ask for the service.

SHEEP CAMPAIGN VERY SUCCESSFUL

Written for California Cultivator
By Professor R. F. Miller

TO INCREASE sheep and wool production in California, to assist farmers in securing small flocks of sheep, a sheep campaign was proposed by the animal husbandry division of the college of agriculture early in July to be carried out in cooperation with the extension division of the college of agriculture. The project was formally adopted on August 1, to be carried on four months, closing on December 1.

The plan was that farmers should be told of the government's need for all the wool available and the desirability of farmers keeping small flocks of sheep on farms. Those who were willing were asked to sign pledges of the number of sheep they would keep and on these pledges they might signify whether they would get the sheep themselves or whether they wished the farm bureau to buy the sheep for them. If the farm bureau was to buy the sheep they would be purchased locally if possible, but if not, the animal husbandry division of the college of agriculture would get the sheep and ship them into the county at cost. The actual total increase in the number of sheep kept on farms as a result of this campaign was 47,123, of which 30,038 were placed on farms through the bureau, of which 20,186 were actually covered by signed pledges from 259 farmers. The great majority of these were procured locally but 2456 were supplied through the animal husbandry division.

Upon notification that the sheep were available, the farmers having ordered sheep, deposited the required amount of money in the local banks,

Professor Miller selecting "Liberty Flocks" to be distributed through the farm bureaus.

and sometimes sent a man to look over the sheep. Upon receipt of the final order, the sheep were shipped to some central point where the farm advisor, with the assistance of the sheep committee, distributed them among the farmers. Freight charges were pro-rated among farmers receiving the sheep, and the farm bureau committee collected and forwarded payment to the animal husbandry division.

The regents of the University of California upon request by the dean of the college of agriculture set aside a special fund of $15,000 to be used in purchasing and distributing sheep. This amount was found insufficient and an additional $10,000 was later added to the above fund.

The sheep supplied were mostly secured from range men who discard their older ewes every fall. These ewes varied in age from five to seven

Country Hide *Packer Hide*

Good hides make your cattle worth more money

Leather tanners are very careful about the hides they buy.

They want hides that are as nearly perfect as possible — hides that are without cuts and scores, and that are properly cured.

There are two classes of hides on the market—"country hides" and "packer hides."

Country hides are those taken off by small butchers and farmers. Packer hides are those taken off by the packers.

* * *

To take a hide off correctly is not easy. Unless great skill is used the hide will be marred by cuts and scores.

The packers have made a careful study of hides. They have trained experts who do nothing else but take them off. Hence, packer hides have few cuts and scores, and are uniformly and properly cured.

Swift & Company sorts its cured hides into grades or classes, according to quality and to the purposes for which they are best adapted.

Some country hides are good; others are very poor.

They usually have cuts and scores and are not cured so well. Some have also begun to deteriorate because of being held too long. Besides, they cannot be graded so uniformly. In the same batch there are both good and poor hides.

Because of this superiority of packer hides, tanners pay from two to five cents a pound more for them. If country hides were as good, tanners would gladly pay an equal price.

This increased value of packer hides means that you get for your cattle from $1 to $3 or more per head, additional.

Swift & Company does not deal in country hides at all, and has no interest in their purchase or sale. It is the hide dealers and tanners who notice the difference in quality, and pay accordingly.

Swift & Company uses skill in taking off hides, not because it wants to see country hides bring lower prices—but because it is part of its policy to produce articles of the highest quality.

* * *

This is only one way the packer has increased the value of your cattle. Many other by-products have been improved in a similar way.

Swift & Company is constantly on the lookout for new ways to improve the value of its products, and hence to make your cattle worth more money to you.

When Swift & Company says that its profit on beef averages ¼ of a cent a pound, this includes the profit from the sale of hides.

years and would not be satisfactory in range bands any longer where feed was often short and conditions severe. However, in small numbers under farm feed, such ewes are serviceable for one or two more seasons and can then be disposed of for slaughter. The ewes were Merinos or cross-breds and bred to good Shropshire or Hampshire rams. In some cases the ewes were bred to pure bred rams at the university farm at Davis, which necessitated holding them there at least six weeks.

The following counties were supplied: Stanislaus, 450 head; Yolo, 275 head; Merced, 300 head; San Joaquin, 124 head; Contra Costa, 190 head; Napa, 420 head; Monterey, 393 head; Santa Cruz, 116 head; San Diego, 178 head.

Total number of sheep distributed in this way, 2456 head. In addition to these, 1872 head were selected for individual parties and were not distributed through the farm bureaus. I am not in possession of the exact number of farmers receiving sheep, but it is safe to assume that at least 200 farmers are now keeping a flock of sheep where no sheep were kept before. It is also very gratifying to know that the farmers were universally well pleased with the sheep supplied.

In addition to the number of sheep supplied by the animal husbandry division, many farmers bought sheep personally from neighboring flocks, due to this sheep campaign. Napa County alone increased its sheep population by 4548 head; Contra Costa about 1500 head; Stanislaus County 2500 head. From these figures it is safe to conclude that there is an increase of at least 15,000 head of sheep on the farms throughout California due largely to the "Liberty Flock Drive."

Live Stock News Notes

84 Shorthorns Average $7090

In the dispersion of the herd of Shorthorns owned by F. A. Gillespie & Sons, Muskogee, Oklahoma, 84 head sold for an average of $1090 Twenty-two bulls averaged $1838 and the 62 females $824. H .C. Lookabaugh of Watonga, Oklahoma, paid $10,700 for the bull, Maxwalton Commander. Maxwalton Commander is a son of Avondale and is out of a Roan Lady dam. Roan Lord, a two-year-old son of Revolution and Maxwalton Roan Lady, a full sister to Maxwalton Commander, was purchased by Strong Bros., Clinton, Oklahoma, for $10,000.

California's Winning Pen of Barrows

The pen of Poland-China barrows shown by the University of California, at the International Show held in Chicago. In the single classes the barrows were second, third and sixth, being beaten in class by the champion. Shown together, they were reserve champion pen of the show.

Edward Bishop

Edward Bishop, member of the firm of Bishop Bros., San Ramon, and one of the most prominent men identified with the Western sheep industry, fell a victim of influenza while attending the recent International Live Stock Show at Chicago,

Community Sales in Nevada County

The second annual report of County Farm Adviser H. I. Grasser of Nevada County has been issued. During the past year two community live stock sales were held. Cattle and hogs to the value of $30,000 were disposed of. The farm adviser also states that the campaign for more live stock resulted in an increase of 1000 hogs and at least 700 sheep.

Uneeda Durocs in Demand

Clayton N. Slocum, manager of the Uneeda Glenn County herd of Durocs, Willows, writes that they are having a splendid demand for their Durocs.

Quite recently this herd furnished a number of foundation herds to settlers of the state land colony at Durham.

Hotel Trophy for Berkshires

Berkshire breeders who will exhibit at the California International Live Stock Show, San Francisco, in February, will have an opportunity to compete for a number of fine trophies offered as special premiums. The Hotel Whitcombe, San Francisco, is offering a $300 silver tea set for the best herd bred by the exhibitor. The herd to consist of one boar and three sows.

Wool Growers to Meet

The 55th annual convention of the National Woolgrowers' Association will be held at Salt Lake City, January 16, 17, 18.

One of the principal questions that will be considered will be the outlook for next year's wool clip.

654,375 Holsteins Recorded

Volume 38 of the Holstein-Friesian Herd Book is off the press and ready for delivery. It contains a record of all pure bred Holstein-Friesian cattle approved and admitted for entry since the close of volume 37. The registrations include bulls numbering from 216626 to 230705, and cows from 391506 to 423670—a total of 14,080 males and 32,165 females recorded between September 1, 1917 and February 26, 1918. The grand total registrations of Holstein-Friesian cattle recorded in the herd books to date reach 654,375, with volume 39 in course of preparation.

Volume 38 contains a complete record of animals registered, their age, sire and dam, also their breeders and owners. The price charged for the

herd book—$2.75 delivered—is much below the actual cost of compilation, and every owner of pure bred Holstein cattle should avail himself of the opportunity to obtain a copy by ordering one immediately from the office of The Holstein-Friesian Association of America, Brattleboro, Vermont.

Higdon Sells Richly Bred Calf

Wingard & Bellows, of Kern County, recently purchased a richly bred young bull to head their Holstein dairy herd from W. G. Higdon, Tulare. The youngster is by Prince Riverside Walker and out of the great two year old Madrigal Mooike 2nd, who will finish her year's test in January with over 20,000 pounds milk and around 750 pounds butter.

Higdon Sells a Foundation Herd

J. H. Posty of Atwater recently purchased a foundation herd of registered Holsteins from W. J. Higdon, Tulare. The selection included three A. R. O. heifers, two of them with records above 20 pounds butter in seven days, and a great bull calf. The future herd sire, King Korndyke Pontiac Fobes, was only 40 days old at time of purchase, being the oldest son of the $6500 bull King Korndyke Pontiac 20th that Mr. Higdon had. This choice young fellow is out of the 25.61 pound senior four year old Mona Fobes, thus giving him an average of 31.71 pounds butter in seven days for his dam and sire's dam.

Abbott Back on the Job

The Holstein fraternity will be glad to know that Kenneth W. Abbott has recently received his discharge from the army and plans to return to his home at Milpitas and resume his breeding activities. Mr. Abott, a former secretary of the California Holstein Breeders Association, won his way to a sergeancy while in the army.

Eastern Stables to Show at San Francisco

Joseph E. Painter announces that among the Eastern stables that will exhibit at the San Francisco show in February will be Mrs. Lulu Long-Coombs of Kansas City; John R. Thompson, Chicago; Chas. E. Bunn, Peoria, Illinois; Geo. A. Heyl, Washington, Illinois. Mr. Painter also expects the famous Swift six horse hitch.

Karakul Sheep for California

The Fresno Farms Company, Kerman, has purchased a half interest in a flock of 200 Karakul sheep from Dr. C. C. Young of El Paso, Texas.

Karakul sheep come from Central Asia and are valued highly for their skins which are used in high class fur trade.

Jenkins' Jersey to the Top

The Jersey cow, Irene's Cadora, owned by A. A. Jenkins, Tulare, completed a year's test November 28, during which she is credited with a production of 804 pounds butterfat and 13,485.4 pounds milk. It is stated that Irene's Cadora is the first cow owned in Tulare County to exceed 800 pounds.

Store Your Grain in Bulk

Don't Sack it

The bulk way of handling grain is the safe—the more economical way. It cuts out the entire cost of sacks, twine and the wages of extra help needed to sack grain for shipment.

The Wasteful Way

Threshing, sacking and dumping grain on the stubble means large waste to every crop you thresh.

Moulded grain after an early rain, or even sunburned sacks which weaken and break, cause a large loss of grain each year.

Rodents—rats, mice, gophers; birds, thieves, all these are enemies to economic grain handling. They cause waste that cannot be replaced.

Leaking sacks, either at the twine or from weak weaving or snags and rips, allow a constant, costly flow of grain.

Often thieves obtain grain from the fields or during shipment—a whole sack at a time, maybe several sacks.

Handling grain in sacks costs more each year. It wastes more as your crop becomes bigger. Stop it.

The Economic, Saving Way

Thresh your grain directly into dump wagons and haul immediately to a safe metal storage bin on your own farm.

Stop the waste of sweating and blistering sacks. A metal bin will keep your grain clean and sweet—away from the weather.

Calco Metal Grain Bins are proof against the attacks of rats, mice, and gophers. Birds cannot reach grain in a metal bin.

Since you need no sacks with a metal bin there is absolutely no loss through leakage, carelessness or forgetfulness.

A door with a lock keeps thieves out—and bulk shipments of grain do not tempt the thief, he has no way to carry off his plunder. Metal bins are the "save first" method of handling grain.

Write for the Calco Grain Bin Booklet

In this booklet, one grain grower makes a comparative cost tabulation of handling his grain in sacks and handling it in bulk. He found out, and set down exactly where he saved in handling grain in metal bins. This letter and a great deal of other information are in the booklet "Calco Grain Bins." It is free—write for it at once.

Calco Metal Grain Bin

A Healthy AYRSHIRE

This champion three-year-old is a notable example of perfect health. Her yearly record is 15,056 lbs. of milk and 589.2 lbs. of butterfat.

JOIN THE
"HEALTHY COW"
MOVEMENT

Present - day prices for dairy products are making dairymen everywhere think more about the milk production of their cows.

The "poor-milker" is usually non-productive because of some disorder of the digestive or genital organs that is sapping at her health and strength. Even apparently slight troubles of this nature usually lead to more serious ailments so common among dairy cows, such as Abortion, Retained Afterbirth, Barrenness, Scouring, Bunches, etc.

A sick cow should be treated like a sick person—with medicine that will correct the trouble. Kow-Kure is the most valuable and best known remedy for the prevention or treatment of cow ailments because its medicinal properties act on the organs where disease originates.

There will be no trouble about the milk flow of a healthy cow; keep yours healthy by having KOW-KURE on hand always. Druggists and feed dealers sell it, in 60c. and $1.20 packages.

Free book, "THE HOME COW DOCTOR," is yours for the asking.

Some Sidelights on Big Tagus Sale

During the six continuous days of the Tagus Ranch auction sale at Tulare almost $140,000 was the total sales of live stock and implements.

Henry Lynch, one of California's biggest cattlemen, purchased one of the Sandusky tractors, his young son apparently being the real inspiration.

W. Mayo Newhall secured a choice lot of Percheron mares and also bought one lot of 86 steers.

Edward Cebrian was a prominent buyer of Percherons and Belgians, securing some of the best. Mr. Cebrian also secured a high class selection of implements. These will go to his 90,000 acre Cuyama Ranch in Kern County, which is being fitted up as the future home of 700 pure bred Shorthorn cows recently bought from Palcines Ranch.

The Red Cross netted over $500 from the serving of lunches during the sale. All materials were donated by Mr. Hulett C. Merritt, multi-millionaire owner of Tagus Ranch, and the arrangement and serving of the lunch was carried out by the ladies of the Red Cross under the direction of Mrs. R. F. Guerin of Visalia.

Leeman & Kilgore were the lucky buyers of the twin Holstein heifers sired by King Segis Ponitac Jannek and out of 27.98 pound three year old Forest View Wayne Korndyke.

J .A. Knight, Tipton, bought 23 head of registered Holsteins as a foundation herd.

H. H. Morser made one of the keenest buys of the sale when he secured the 26 pound three year old Iris De Kol Aaggie Lass and her son by King Korndyke Sadie Vale 27th.

When Orion's 'Golden Col was knocked down to G. W. Emmons for $650 it registered the second highest priced boar ever sold at public auction in California and the difference is only $25 at that. Mr. Emmons followed up by buying the great boar California Defender for $450.

The high sow, Crimson Beauty, went to Harry Cope for $520 and at the price she looked one of the best buys in the sale. Mr. Cope was the last contending bidder on Orion's Golden Col.

Duroc-Jersey buyers were present from as far north as San Francisco, as far south as Los Angeles, and as far west as Santa Clara County. Some idea of the briskness of the sale may be had from tht fact that Col. Ben A. Rhoades sold the entire 200 head in the sale in exactly four hours.

The Belgian stallion Adonis at $1900, the Belgian stallion Cadet at $2100, and the Percheron stallion Paulus of Palcines at $1450, were the three highest priced draft stallions ever sold at public sale in California.

Frank M .Helm and H. E. Vogel, well known Holstein breeders of Fresno, blossomed out as buyers of draft horses in this sale.

The big sale moved too rapidly for some of the intending buyers and as a result some "post mortem" sales took place netting good profits to the original purchasers.

A deluge of applications for leases flood the offices at Tagus Ranch, ranging from requests for 20 acres up to number of urgent demands for a lease on the entire 6000 acres.

It required over 60 cars to ship out the live stock and implements bought by buyers from a distance. A circumstance unique in farm auction sales was the fact that a large percentage of the implement buyers were from distant points.

The entire advertising, selling and accounting systems which made the big sale an outstanding one for the smoothness and speed with which it progressed, were laid out and put into action by the sale manager, C. L. Hughes.

Nobody really knows how many days, one after the other, Col. Ben A. Rhoades can sell from the block finishing up apparently as fresh on the last day as on the first. The big crowd at California's biggest public sale voted him "the best auctioneer ever."

Northern Live Stock Notes

Written for California Cultivator By W. S. Guilford

There are early lambs in the Woodland district—born the first and second week in December. Many of these are in small farm flocks of splendid high grade blackface and Rambouillet ewes.

When Shropshires that have been in the habit of dropping lambs in March, April and May are first brought to the Pacific Coast the lambing period remains late for some years. They may lamb one or two weeks earlier each year but we have not been able to get December or January lambs from Shropshire ewes imported from the East. With ewes that have been bred up from natives by the use of good rams the lambing period remains early.

Sheep are in splendid condition in the Sacramento Valley now. There is good feed, and rain is coming frequently. This should insure a good lamb crop—and a good spring clip of wool, for continuous good feed is necessary for the proper development of lambs and the growth of an unbroken staple of wool.

There is talk of a considerably reduced price for both lambs and wool in the spring. Time alone will tell—I doubt if anyone can know definitely about it.

We shipped a car of registered Berkshires from the Monroeville herd to the Western Meat Company last week, and while at the South San Francisco plant of the concern I saw about 4000 of the best hogs it has ever been my good fortune to inspect in the West.

In common with the Eastern markets the Coast killers have had to face very heavy shipments. The labor supply has been greatly demoralized because of the influenza epidemic and it has been impossible to run full killing gangs. So there was a "glut" in the yards. There were more hogs on hand than they could kill in a week—and notice had to be sent out to hold up shipments until they could get room to handle them.

The result of the use of good boars was very much in evidence in the hogs I saw. The work of the California Swine Breeders' Association is beginning to show in the quality and finish of the hogs reaching the market. There were lots of fine grade Poland Chinas, Berkshires, Durocs and Chesters, and many others showed various crosses of these breeds. But there was not a real poor hog in the lot, and very few that were not fat. The patriotic appeal to finish hogs and the low price of barley are also factors that have had an effect on the hog

situation.

If President Cunningham and Secretary Thompson could have se all of these well bred, well fed hogs they would surely have been pleased, and felt that the unselfish, untiring work they have been doing for years in the interests of the California hog industry has not been in vain.

General Manager F. L. Washburn of the Western Meat Company told me something about the hog situation that was new to me.

"The Eastern packers of pork products have had a monopoly on the export demand to the armies," he said, "because of the high rate on our product to New York. We pay one cent per pound less for the hogs but that does not make up the difference. That accounts for the price being lower here now than in the East. In previous years the quality of California hogs has been such that we could not compete with Eastern hams and bacon. Now that we are producing as good a product as they are in the East it is hard to get retailers and consumers to believe it.

"I would like to see a stock yards in San Francisco, and buy our hogs on the open market the same as in the East," concluded Mr. Washburn.

Long-sighted breeders and business men on the Pacific Coast have always looked forward to a time when the productive valleys of California and other Coast states would be supplying registered breeding animals to the whole Pacific Ocean country, Hawaii, the Philippines, Japan, China, India, Australia, the South Sea Islands, Central and South America. Already a start has been made along that line, and present indications are that this trade will be very greatly extended during the next few years.

Great Britain has jealously guarded the big export business that has been one of the great incentives for the development and increase of registered live stock in England, Ireland and Scotland.

During the war breeders, breed societies and farm papers in Britain vigorously protested against any restrictions being placed on this export business—it being frankly stated that any interruption in it might result in the losing of at least a part of the business to breeders in North America.

ENGLAND WILL BUY AMERICAN PERCHERONS

British horsemen have organized a Percheron Breeders' Society. The French horse has made a strong impression on Englishmen and it is stated that there is developing a keen demand for them. Owing to the fact that the French government has forbidden the exportation of any mares for an indefinite period the British Percheron society has decided to send a commission to America this coming season to make direct purchases for its members.

Such a commission will purchase better horses, will pay prices commensurate with their values, and will place them in the hands of British breeders to better advantage than if the matter were being handled by private speculators.

The announcement of this action by the British Percheron society will put an end to the activities of numerous dealers who have been attempting to negotiate purchases of Percherons at low prices for exportation to Europe. It will defer such exportations for a few months, but will be ultimately much more advantageous to our breeders of good stock than any other course.

LIVE STOCK QUERIES

Age to Breed Gilt

I have a pure bred gilt that was farrowed the first week in May and weighs about 180 pounds. Would it not be alright to breed her this month? If so is there any way of getting her ready to be put to a boar. As yet I have not noticed her being in heat.—J. Z. S. Sacramento.

No definite rule can be given as to breeding young gilts. Most breeders are guided by circumstances as to the development of the gilt in question. If it is desired to secure the maximum growth breeding should be deferred until the gilt ih a year to a year and half old—not because growth is checked through purgnancy, but because growth is very apt to be checked after farrowing and while suckling a litter.

If your gilt shows plenty of development, there is no particular reason why she should not be bred now. If bred early in January, she would farrow late in April. In your locality it is not advisable to have pigs born in the middle of the summer because of the heat.

If your gilt is put in a pen with a boar, she will probably come in heat in due time.

Feeds for Work Horses

What do you consider the best feed for work horses, and what is the proper ration? — A. D. Co., San Bernardino.

Oats have long been considered the most satisfactory grain for horses, but the cost usually makes it advisable to use some other grain or at least substitute other grain for part of the ration.

In this state, where barley is the principal grain and alfalfa hay the chief roughage, quite satisfactory results can be obtained from these two feeds as they balance each other fairly well, and at present prices will prove most economical. The amount to be fed can only be suggested in a general way, for the reason that horses show more individuality than other classes of live stock. In general, it is safe to figure that horse at moderate work will require a pound of grain and a pound of hay per 100 pounds live weight. If it is noticed that the horse is losing or gaining weight the amount should be increased or decreased accordingly.

Any one-grain ration will be improved by adding other grains and feeds and if the cost is not too great, a variety should be fed.

For practical purposes barley, oats and corn are interchangeable in a ration. If bran is available a ration of equal parts barley, oats and bran makes an excellent ration.

COW TESTING IN RIVERSIDE COUNTY

The Riverside Cow Testing Association is being reformed on a slightly altered basis. As a result of a meeting held December 17, it was decided to enlarge the association to the extent of two or three hundred additional cows.

At the present time one tester is taking and testing samples of milk from about 600 cows. The tester is given board and room by the dairyman over the night required to take the night and morning samples. The association provides herd record books into which the monthly tests of each cow together with the feeds given may be recorded. The charge is $2.00 per cow per year.

One cow losing ten cents a day nets a loss of $36.50 a year; hence the association.—L. B. M.

for Contagious Abortion

Don't sell the aborters. Clean out the infection. Breeding animals are worth more than ever before. Control of Abortion is doubly necessary.

Every time a cow drops a calf—whether alive or dead—by premature birth or aborting, whether the afterbirth is retained or not, her reproductive organs should be flushed out once or twice with B-K. The Abortion infection develops in the uterus and vaginal tract. This infection causes Barrenness, Retention of Afterbirth and Calf Scours in addition to Abortion. Unless checked it is likely to run through your entire herd.

B-K is a powerful non-poisonous antiseptic—scientifically correct for this work. Used as a douche, it dissolves the slimy albuminous matter, kills the germs, stops discharges and controls the infection. B-K is much more effective than lysol, carbolic acid, Lugol's solution, bichloride of mercury and coal tar disinfectants, all of which tend to coagulate or thicken the albumins.

Contagious Abortion is being successfully controlled in many herds by following our simple plan with B-K. A well known breeder of registered stock says:

"I have been using B-K according to directions and the results have been very gratifying. My cows have every one passed the time for aborting and are calving all right in a natural way. I had lost $1,500.00 on my cows and feel that B-K has cleaned up the trouble entirely."

B-K is sold by Dairy and Farm Supply Dealers, General Stores, Druggists, etc. If your dealer does not have it, send us his name.

There are over "145 Farm Uses" for B-K

FREE BULLETINS: Send for our valuable bulletin No. 52. on "Contagious Abortion," also "145 Farm Uses" and our "Trial Offer."

Holsteins in America

The Holstein-Friesian breed of dairy cattle has been established in this country nearly 50 years and has made good from the Atlantic to the Pacific. The breed has long been used to improve the dairy qualities of the cattle of Europe. It is in demand also in Canada, Mexico, Australia, New Zealand, South Africa, Japan, Argentine, Central America, and other countries, and holds all records for largest yield of milk and butter. They are large, strong, vigorous, prolific, and productive cattle, and succeed under all climates and conditions.

Veterinary

Answers in this column by Dr. Wm. Petrie, 2714 South Harvard Boulevard, Los Angeles, are without charge. For immediate mail answer remit $1.00. In writing questions give full symptoms or particulars of injury of animal.
Unsigned communications receive no attention.

Bruised Shoulder

Have a mare that has a lump on her shoulder about half way up that I think was caused by a bruise. One morning I found the lump on the shoulder about the size of a man's fist. Think it came from a bump against the stall. It was very sore at first but now the swelling has gone down a little and it is not very sore but is hard. I wish to work her soon. Please advise treatment.—Subscriber, Orange Cove.

Probably there is pus deep down in the lump. It will not come to the surface nor absorb in a long time. These swellings are called "cold abscess." Better have a veterinarian open it. Split the lump wide open and find the pus. It will take some time to heal it but it will never be right until the pus is out.

Milk Fever

I have a Jersey cow that came fresh on the 2nd of December. By the end of the week she was giving four gallons of milk per day. On the 9th she had a bad case of milk fever which paralyzed her so she could not stand. We gave her a pound of epsom salts and inflated the udder with a bicycle pump. Next day she was up and now has a very good appetite. She is giving only two quarts of milk now per day and her udder is rather hard and the milk is stringy. That from one teat is slightly bloody. What can I do for her?—Subscriber.

Salts or any medicine in solution should never be given to a cow with milk fever because the throat is partly paralzed also and the medicine is liable to go down into the lungs and strangle them.

Air in the udder is all right providing it is passed through absorbent cotton to take out all the dust. The air pump that veterinarians use to inflate the udder has a chamber through which the air passes and they place some fresh absorbent cotton in the chamber each time before using it. It is well also to put some menthol or eucalyptus oil with the cotton. That cleanses the air and it does no harm. No doubt the air you pumped into the udder was not pure and the particles of dust in it have caused inflammation of the udder.

You may be able to save part or all of the udder but she will never give the milk she did before. Rub the udder well with the hands and milk her out well three times a day. Mix three pounds of epsom salts with two pounds of common salt and give her a handful of it once a day in the feed. This will thin the blood and help to reduce the inflammation in the udder.

Colt With Scours

Am breaking a three year old colt taken from salt grass pasture. Am feeding alfalfa hay. Colt has scours due, I suppose, to change of feed. Colt was not in first class condition when taken from pasture. As alfalfa is all I have except a very small amount of barley hay what would you advise?—Subscriber, Fowler.

Alfalfa does cause scours in some horses. Feed the barley hay at least half the time. Alfalfa intended for feeding horses should be allowed to get pretty ripe before being cut for hay, then it will dry better and be more brittle. Alfalfa cut quite green makes soft, tough hay that is apt to physic a horse and may roll up in wads and clog the bowels. Alfalfa cut green makes good hay for cattle as the wads are just what they like to remasticate.

Lump Jaw

Several months ago a slight enlargement commenced on the under part of the lower jaw of a heifer I have. It seems to be a bony growth gradually enlarging and growing right into the bone of the jaw. It seems to be somewhat tender and if I am not mistaken, pus exudes from it. Please name the disease and the remedy.—Subscriber, Hanford.

Lump jaw (actinomycosis is due to a germ that gets into the jaw bone through the gums about the teeth. It is hard to cure. Iodine is the only remedy that seems to do it any good. Have your druggist prepare these remedies. Four ounces of the iodide of potash dissolved in one quart of water. Give one ounce of the solution on a little feed once a day for two weeks then once every other day while it lasts. Also; two ounces of the tincture of iodine, one dram of iodine crystals and enough lard oil to make four ounces. Use a swab and put some of this on the lump every day.

Cow Pox

This fall cow pox started in my herd of milch cows. All got well but the teats of two of the cows and they have deep sores that I cannot heal. Have used sheep dip solution, wool fat, carbolated vaseline and cuticura salves but with no noticeable effect. Please prescribe for the trouble.—Subscriber, Tulare.

Try an iodine ointment made as follows: Two ounces of the tincture of iodine, half a dram of iodine crystals and enough lard oil to make four ounces. After milking apply the ointment with a small swab.

LIVE STOCK NEWS FROM NEVADA

The Nevada Packing Company of Reno is cooperating with the agricultural division of the University of Nevada in purchasing pure bred hogs for the members of the boys and girls animal husbandry clubs throughout the state.

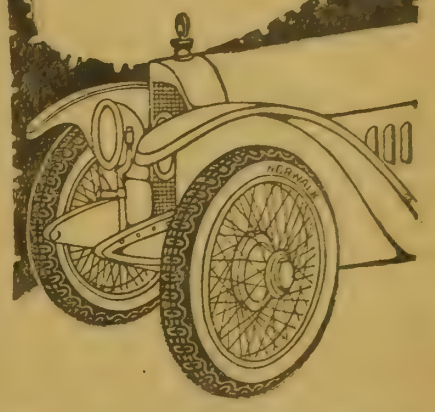
The Upper Carson Valley near Minden, Nevada, is developing into a real Ayrshire country. This is a very productive valley, surrounded by high and picturesque mountains.

W. C. Short, pioneer Shorthorn breeder of the Truckee Meadows, has lately sold his junior herd bull to the Constantia Ranch, who will use him in their pure bred herd of breeding cows.

The University of Nevada is mourning the loss of the Hereford cow Ramona, that died a short time ago. The cause was probably bloat. She leaves a lusty bull calf, sired by Beau Perfection 34th. Beau Perfection 34th is out of the same dam as Woodford and by Beau Perfection 15th by Perfection.

W. D. Duke of Likely, California, has just turned over a car load of Hereford heifers and bulls to Ed J. Morgan of Northam, Nevada. The animals are to be fitted for the spring Hereford sales. Mr. Morgan was formerly herdsman for the late Governor Sparks.

QUERIES



Continued from Page 15

when picked. Lower temperatures will allow the chilis to mold before drying and higher temperature will blacken and make the chilis brittle. A house 20 by 30 feet will cost about $1000 complete, and the cost of fuel is about $1.50 a day for gas and $3.00 a day for stove distillate.—J. B. N.

NORWALK TIRES

Here's a tread that's "tougher than a pig's nose." The tread has from two to three times the tensile strength of ordinary casings and the mileage service has always kept at the highest pitch.

Grow Wheat in Western Canada

One Crop Often Pays for the Land

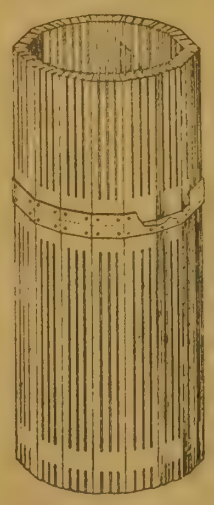
Western Canada offers the greatest advantages to home seekers. Large profits are assured. You can buy on easy payment terms,

Fertile Land at $15 to $30 per Acre—

land, similar to that which through many years has averaged from 20 to 45 bushels of wheat to the acre. Hundreds of cases are on record where in Western Canada a single crop has paid the cost of land and production. The Governments of the Dominion and Provinces of Manitoba, Saskatchewan and Alberta want the farmer to prosper, and extend every possible encouragement and help to

Grain Growing and Stock Raising.

Though Western Canada offers land at such low figures, the high prices of grain, cattle, sheep and hogs will remain.



Loans for the purchase of stock may be had at low interest; there are good shipping facilities; best of markets; free schools; churches; splendid climate; low taxation (none on improvements).

For particulars as to location of lands for sale, maps, illustrated literature, reduced railway rates, etc., apply to Supt. of Immigration, Ottawa, Can., or

GILBERT ROCHE,
3-5 First St., Sheldon Block, San Francisco, California.
Canadian Government Agent.

WESTERN CANADA Farm Lands Low Prices in the Wheat Belt of America

Cost of Wells Reduced

Hawley's Perforated Redwood Well Casing

Cheapest—Best—Most Durable

Galvanized iron, steel pipe and brass points for casing wells is scarce and high priced. Hawley Perforated Redwood Casing is better than these materials and costs much less. Where it has been used for several years under heavy duty, it has proven its durability against every other material and ranchers who know about it will use no other. This casing is made of Redwood staves ⅞ inch thick and 1½ inches wide, beveled to make a perfect tube when put together. In each stave are two wedge shaped perforations one foot long. Any careful person can put these staves together. They are made for wells 6 to 12 inches in diameter. The slots give more sieve surface than perforations and prevent clogging. The slots are made large or small to suit the character of the sand.

Ranchers, Well Drillers, Irrigation Companies and Pump Dealers will find Hawley's Perforated Redwood Casing is made right and will give more and better service for less money than anything else they can buy. Send for descriptive circular and prices. Address

G. M. HAWLEY, La Mesa, Calif.

Why Hens Don't Lay

Written for California Cultivator By Jean A. Koethen

THE hens in our back yards may be roughly divided into three classes: Pullets, yearling hens and hens over a year old. The first ought to lay in the fall, the second may or may not, according as they are possessed of the "bred to lay" instinct, the third rarely will. But it is to the pullets chiefly that we must look for fall eggs.

The first factor in determining just when a pullet should begin to lay is breed. White Leghorns begin to lay at from four and a half to six months old, some even earlier. A Leghorn hatched in April has therefore abundant time for maturing before October and ought to be a dependable producer of October eggs. Plymouth Rocks and Rhode Island Reds require from seven to eight months to attain full maturity. They must be hatched in March to make sure of November eggs, and even then the pullet molt sometimes comes in and delays production. Orpingtons reach maturity earlier than Rocks and Reds. In my experience pullets hatched in March rarely fail to lay by November, and most of them lay considerably earlier. An Orpington of good strain should begin to lay at from five to seven months. Light Brahmas and others of the meat breeds can hardly be expected to lay before eight months and one need not be surprised if they postpone the first egg till ten months of age.

Knowing how many months are required for maturity of a given breed, we can plan our hatching accordingly. But there is still the fall molt of January and February and sometimes of March pullets to be reckoned with. I find, however, that most Leghorn breeders hatch in February and take their chances on the fall molt. Some claim that abundant feeding keeps the pullets laying even if they do molt; others that early hatched pullets are not as susceptible to chicken pox as the later ones. However, that may be, the fact is, we must keep fall molting in mind as one of the things that may keep a pullet from laying when she is old enough and large enough and apparently entirely mature.

But suppose a pullet is old enough to lay and still does not begin to shell out the eggs in time? We must look now to the feed. The secret of getting pullets into laying shape at the earliest possible moment seems to lie in abundant feeding. One successful poultryman whom I have quoted before makes his pullets lay whether they are molting or not, by the simple expedient of giving them after their crops are full of grain at night another meal of moist mash which stuffs them to the limit. It takes a good deal of feed to bring a pullet to laying maturity and a good deal more to give her ample material for manufacturing eggs.

Not only must the crop be full when the pullet goes to roost, but it must be full of the right kind of feed. Hard grain alone will not answer. A balanced ration composed of hard grain, ground grain, animal food in the shape of beef scrap, fish scrap, blood meal or buttermilk, and green feed is absolutely essential to egg production. No commercial poultryman thinks for a moment of producing eggs without a hopper full of dry mash always before his hens. He probably gives a wet mash in addition to this some time during the day and the wet mash contains some greens or cooked vegetables or perhaps buttermilk in addition to the ground grain.

Sometimes pullets can be coaxed into laying by the addition of vegetable protein to the mash. At the Maine station it was customary for some years to add linseed meal to the mash in September, omitting it in October and adding it again in November. Soy bean, peanut and cocoanut meal are all useful additions to a mash for pullets but they do not take the place of animal meals or buttermilk.

Feeding formulas have been given so often in this column that I hardly need mention them, but it may be of interest to some readers to learn that in the fifth egg laying contest at Storrs, which closed in November, 1917, the scratch feed consisted of equal parts by weight of cracked corn and wheat, and the mash of equal parts by weight of wheat bran, corn meal, ground oats, flour middlings and meat (beef scrap, fish scrap or both). I have not the data for the past year's feeding, but it is doubtless still more simple. Barley has been generally substituted for wheat everywhere the past year, and has been found entirely satisfactory. Here in California we have had to substitute milo for Indian corn, but it by no means takes its place.

Comfortable quarters, an abundant supply of fresh water, freedom from insect pests, and oyster shell for the shells of the eggs are all important if a hen is to do efficient work. Leghorns especially are quite sensitive to cold. A cold or rainy spell nearly always checks laying. This fall the weather has been so uniformly good that it can hardly be made an excuse for the failure of a single biddy, but from now on it may be different. Whatever the weather, we owe it to our hens to see that they are comfortable, protected from wind and rain and sun.

Sometimes—how often it would be hard to say—failure to lay is the fault solely of the hen. She has not been bred to lay, and so she is slow in beginning and lazy after she has begun. There have heretofore been a good many such hens in our flocks, but stern necessity has forced us to learn how to pick them out and get rid of them. When a pullet that is well fed and comfortably housed still delays laying a month or more later than she should, it is safe to conclude that she will never be a profitable producer. The profitable hen begins on time and keeps right at it.

What about stimulants, egg makers, tonics, etc.? A hen that will not lay on a good laying mash when she is comfortably housed and well cared for may perhaps be coaxed to lay a few eggs by means of such things, but sooner or later the piper has to be paid. If stimulants are responsible for a few extra eggs in November or December, they will also be responsible for an early let up in the spring or summer. It is like driving an automobile beyond its normal speed. You may get the speed but the engine suffers. The hen is an egg machine, and, like other machines, manufactures the finished product out of adequate materials and nothing else. Stimulants may make her work a little faster, but she gets through quicker to pay for the haste. Lucky for her if she is not incapacitated for further endeavor.

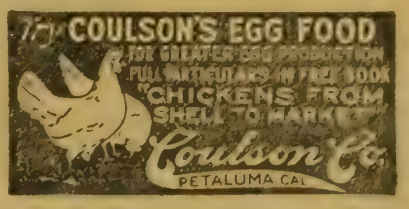
Young toms—1, 2, 3, 4, 5, J. Will Blackman.



HENNERY HINTS

Water the hens early these frosty mornings. They can't make eggs without water and won't drink ice water, to say nothing of breaking the ice on the water vessels.

January is a splendid time for cleaning up preparation for the spring visitation of mites. Dig and scrape and sweep and paint and spray till every bit of wood is clean and sweet. Mites don't like a clean house.

Now is the time to spade up every empty pen and plant barley or oats. It will do no harm to spade the occupied pens as well. Dig your grain into the ground and the hens will enjoy digging it out again. What they do not find will sprout and give them green picking.

The birds that have been to the shows deserve a little coddling when they get home. Put them by themselves, where they can have room to run and stretch themselves, and a little green to nibble. Fertility will be stronger and vigor greater for this humane treatment.

Chickens Sick or Not Doing Well?
An Extraordinary Offer: Germozone is a standard remedy everywhere for chicken troubles, roup, colds, cholera, swelled head, bowel complaint chicken pox, canker, not doing well, non-laying, etc Now our proposition If no dealer there handling Germozone and you will agree to use it and pay if satisfied, we will send you a 75c package without a cent in advance No pay if not satisfied Can we do more? And we will send free 5 poultry booklets Write today
Local dealers handling Germozone will do the same.

GMC TRACTORS

SAMSON SIEVE-GRIP TRACTOR

GMC TRACTORS

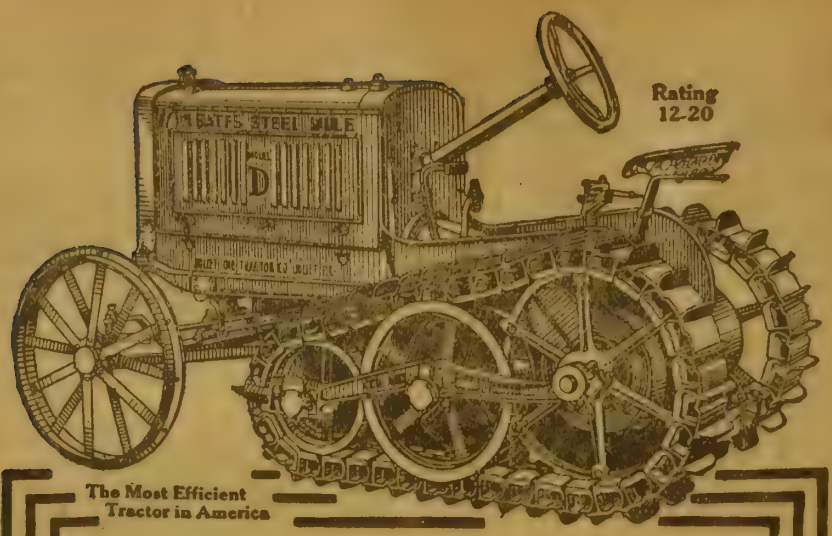
MODEL S-25

The durable tractor is not achieved in a day. Many features, time and experience dictate, enter into its construction.

After nearly two decades of manufacturing and field experience, the GMC SAMSON SIEVE-GRIP TRACTOR is submitted as ideal durability. Many in successful operation for years, and in as effective use today, testify to its ruggedness.

The quality of the GMC SAMSON SIEVE-GRIP TRACTOR is guaranteed before built by careful selection of high-grade materials, made to specifications and over-sized to secure liberal reserve strength. Final severe tests further assure a durable product. It is built SAMSON in name and SAMSON in strength.

The GMC SAMSON SIEVE-GRIP TRACTOR performs the work of ten horses on the farm. It will do your plowing, discing and harrowing economically and efficiently, without packing the ground. It is adapted to countless other uses on the farm for many of which horses are unsuited. It will CUT YOUR COSTS. IT WILL INCREASE YOUR INCOME.



The durable is the efficient, economical tractor.

Our booklet, Better Farming, is yours for the asking.

Samson Sieve-Grip Tractor Co.

Division of General Motors Corporation

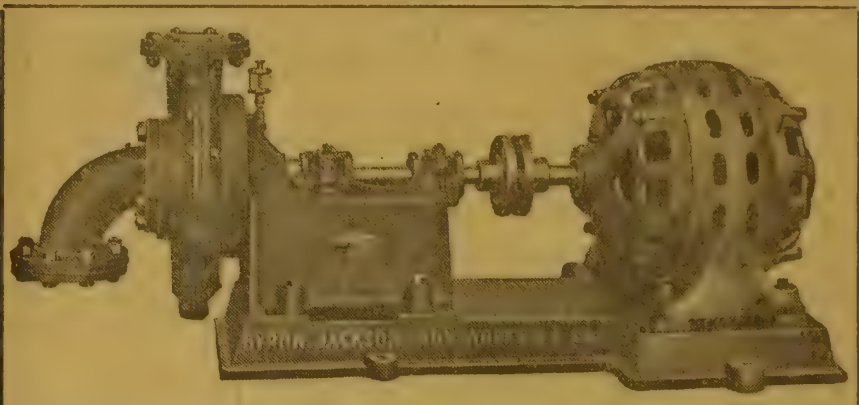
Stockton, California

The Most Efficient Tractor in America

Flexible Construction

Three-point suspension and oscillating crawlers give the Bates Steel Mule unusual flexibility. This prevents internal strains, keeps bearings in perfect alignment and gives a comfort and satisfaction to the operator.

Crawlers that double the tractor's usefulness, Timken roller bearings, hardened cut steel gears, unit construction of power plant and heavy duty valve-in-head kerosene motor contribute to the year-after-year serviceability.



The model "D" BATES STEEL MULE has created more favorable comment than any tractor ever brought into this part of the country. Don't fail to see the one we have here.

THE ONLY CRAWLER TRACTOR ADAPTED TO BEET CULTIVATION WITHOUT MAKING CHANGES.

Excellent Proposition offered Live Agents.

Guidance for Land Settlement

DISCUSSING the capacity of the United States to provide for a very much larger population, the secretary of agriculture, in his annual report, says that the responsibility rests upon each individual, and especially upon the farming population and state and federal agencies responsible for leadership.

"We have, up to the present, succeeded in this enterprise," the secretary says. "In the years from 1900 to 1915 the nation gained a population of approximately 22,000,000, and they have been fed and clothed in large measure from domestic sources. It is estimated that in the years from 1915 to 1918 the population increased by 3,200,000, of which a very small part was from immigration. We shall, perhaps, gain as many more in the next 15 or 20 years, even if the rate of immigration should not be maintained, for the natural growth in recent years, averaging about three-fourths of a million a year, shows an upward tendency.

"It would be desirable to facilitate land settlement in more orderly fashion. This can be effected in a measure by systematic effort on the part of the federal government, the states, and the several communities through appropriate agencies to furnish more reliable information, intelligent guidance, and well considered settlement plans. The nation has suffered not a little from irresponsible and haphazard private direction of settlement. In many sections, especially in the newer and more rapidly developing ones, the situation has been complicated by the activities of promoters whose main concern was to dispose of their properties. They too frequently succeeded in attracting farmers to localities remote from markets where they either failed to produce crops or met with disaster through lack of market outlets or adequate marketing arrangements.

"It is particularly vital that, by every feasible means, the processes of acquiring ownership of farms be encouraged and hastened. This process is real in spite of appearances to the contrary. It has been too generally assumed and represented that tenancy has increased at the expense of ownership and that we are witnessing agricultural deterioration in this district. Tenancy does present aspects which should cause great concern, but its bright sides have not been sufficiently considered. The situation does not warrant a pessimistic conclusion. In the 30 years from 1880 to 1910 the number of farms in the United States increased from 4,009,000 to 6,362,000, the number of those owned from 2,984,000 to 4,007,000, a gain of 1,023,000, or 34.3 per cent, and the number operated by tenants from 1,025,000 to 2,355,000 a gain of 1,330,000, or 129.9 per cent. But in 1910 five-eighths of the farms and 68 per cent of the acreage of all land in farms were operated by owners and 65 per cent of the improved land. The number of farms increased faster than the agricultural population. The only class not operating farms who could take them up were the younger men, and it is largely from them that the class of tenants has been recruited.

"In a recent study of the cases of 9000 farmers, mainly in the Middle Western states lying in the Mississippi Valley, it was found that more than 90 per cent were brought up on farms; that 31½ per cent remained on their fathers' farms until they became owners and 27 per cent until they became tenants, then owners; that 13½ per cent passed from wage earners to ownership, skipping the tenant stage; and that 18 per cent were first farm boys, then wage earners, later tenants, and finally owners. It is stated, on the basis of census statistics, that 76 per cent of the farmers under 25 years of age are tenants, while the percentage falls with age, so that among those 55 years old and above only 20 per cent are tenants. In the older sections of the country (except in the South, which has a large negro population), that is, in the New England and Middle Atlantic states, the tenant farmers formed a smaller proportion in 1910 than in 1900. This is also the case with the Rocky Mountain and Pacific divisions, where there has been a relative abundance of lands. The conditions on the whole, therefore, are not in the direction of deterioration but of improvement. The process has been one of emergence of wage laborers and sons of farmers first to tenancy and then to ownership.

"The legislative steps that have been taken to promote better credit terms for farmers will have a tendency to hasten this process. The operation of the farm loan system, through arrangements by which those who have sold lands take a second mortgage subordinate to the first mortgage of the farm land banks carrying a relatively low rate of interest, will have a beneficial influence. If further developments can be made through the application of the principle of cooperation, especially in the formation of personal credit unions, the conditions will be more favorable. In the meantime special attention and study should be given to the terms of tenancy, including the lease contract, with a view to increase the interest both of the landlord and of the tenant in soil improvement and to make sure that there is an equitable division of the income."

Kern County Cotton

Kern County is proud of her first year's cotton production. We give on this page photograph of the first bale ginned in Kern County. This was grown on the ranch of C. B. Reas near Arvin. Regarding Kern County's production the Bakersfield Californian says:

The distinction of being the producer of Kern County's first bale belongs

Kern County's First Bale

This cotton was grown on the place of C. B. Reas. The staple is 1⅛ inches in length and the cotton of exceptionally high quality.

to C. B. Reas, a cotton planter living near Arvin. Mr. Reas' crop this year consists of 45 acres of the Egyptian long staple variety. The bale weighs 500 pounds and with the present market value of 62 cents for this grade of cotton, is worth $310. In addition to this amount the seed, amounting to approximately 800 pounds, has a value of $24.

Mr. Reas has stored in the warehouse at the gin 15,695 pounds of seed cotton, 4000 pounds of picked in the field, with much more remaining to be gathered. The staple was found to average approximately one and a half inches.

According to estimates recently made by department of agriculture agents, Kern County will harvest approximately 1000 acres of cotton this year.

A School for Farm Boys

By M. E. Bemis

WE ARE often prone to wonder why it is that more farm boys don't take an agricultural college course, and the most common answer is that they can't afford it, that is the majority cannot afford either the time or the cost of four years in college. Years ago Senator Vilas of Wisconsin suggested to Dean W. A. Henry of the Wisconsin college of agriculture that they popularize the college by forming short courses, and after some experimenting the agricultural short course was started and has resulted in doing an immense amount of good throughout the country.

In one of the New England states they have a school for farm boys that is unique, because it is different. To be exact there are two agricultural schools in the state of Vermont. One of these is known as the Vail agricultural school. The purpose of this school is to give the kind of instruction that will be most helpful to boys that expect to become farmers. The time required is one full year. Most of the work of the farms is done by the boys. One week out of each four each boy works as a farm hand, for wages. This school does not pretend to be a school for specialists.

There is only one course, general farming. This course is claimed by the founders of the school — and it seems to be borne out by actual experience—to be the practical instruction needed by the majority of boys who go back to the farms. Incidentally the purpose of the school is to induce the farm boys to become farmers, and better farmers, rather than to leave the farms for some other occupation.

As a farmer is expected to become an influential citizen, the boys at this school are trained in civic and social activities in order that they may become better citizens and of more value to the community in which they live.

Business farming is also a part of the course. Most of the work of this school is in actual practice, and considerably more time is spent in the field, shop, dairy and orchard or garden than in the class room, though textbooks are used to an extent that seems advisable. There is a well equipped library, reading rooms and recreation room. Comfortable dormitories are also a part of the school building group. There are also laboratories, a creamery, well equipped poultry yards, green houses, etc.

The cost of such a school to the students is small. It is said that the actual expenses of the school, including board, are not more than $200 a year and that one-half of this may be earned by the student during the one week of the months that he works as a farm hand.

The other school, which is located in the same state, is run on a very similar plan, although a two years course is provided and the student does a certain amount of prescribed work upon the school farm in the dairy, orchard, etc., but does not work one week in each month as a farm hand.

These schools have proved very popular and are accomplishing just what the founders expected them to, namely, making better farmers of the boys who will become farmers and to make farming and farm life more popular. There is nothing to prevent a boy who takes a course at one of these schools from taking a full four year course at the state agricultural college if he chooses, and he has laid the ground work for such a course. If he is to become a specialist in any one of the many branches of agriculture he needs the full agricultural course, but if, like the majority of farmer boys, he will become a farmer, he gets the help that he needs in one year at this school instead of spending four years for practically the same thing. The only essential difference is the diploma, and is that worth three year's of a young man's life?

Just why a boy or young man should spend four years in learning a lot of things that he is never going to have any use for and will forget within five years after he leaves college, is one of the questions that we don't attempt to answer, but just go on in the same old way, because that has always been the way.

If a young man starts out to learn the carpenter's trade he is not required to learn Latin, or astronomy, or chemistry. He starts right in to acquire a knowledge of things that are to be useful to him. A doctor has as little use for astronomy as the carpenter, but he has to learn it just the same, because that is a part of his regular course of study, and if he didn't take a lot of studies that he would have no use for he wouldn't need to stay in college for four years to get his degree. Of course it is the fashion, and although he is virtually wasting half of his four years, he has to keep right on the beaten path because that is the prescribed method. It has to be so because it has been so ever since the days of Socrates, who had all kinds of time and never considered his pupil's education complete until he had delivered the last lecture to his students while they were waiting for the hemlock to get in its work. We are living in a different age now and we do things in a hurry—except in the matter of education.

Business is sometimes the goad that drives one to a faster speed. Good hard headed business men refused to see the sense in spending four years to acquire a business education when by eliminating the non-essentials the requisite studies and practice could be had in a year or less, so we have business colleges.

We haven't yet applied the same principle to other callings, but why not more real agricultural schools?

TRACTOR DEMONSTRATION AT FRESNO

Writing as to Fresno's offering of opportunity for a great tractor demonstration next spring, O. C. Adams, secretary of San Joaquin Valley Implement Dealers' Association, says:

"As you are undoubtedly aware, Fresno is the center of the largest and most populous district in California. As the big majority of these farmers have small or medium sized ranches, there is a much better market for small tractors than in other sections where the ranches are larger.

"While a demonstration held near a large city may draw a large crowd, we believe that the annual demonstration if held at Fresno will have a larger attendance of actual tractor buyers than any in the history of the association.

"We believe that a demonstration held near Fresno will result in greater benefits to both the manufacturers and dealers than if held in any other section of the state."

Guaranteed to do a Season's Work Without Expense for Repair Parts

Get Our "After the War" Tractor Proposition

Before You Buy Any Tractor

Old methods are past methods. Our method of selling the 1919 MODEL BEAN TrackPULL TRACTOR on an absolute three months season's guarantee basis is simply a reflection of our confidence in the BEAN to do your work.

It means that when you buy a 1919 BEAN TRACTOR you get a bond from this Company with a most liberal guarantee. And in addition we are able now, on account of after the war conditions, to make a

Reduction in Price

And give you the option of cash or time payments. The new price of the BEAN TRACTOR is guaranteed to June 30, 1919. While there is no probability of any further reduction this guarantee means that if the price should be reduced between now and June 30, 1919, the difference in price will be refunded.

This entire "After the War" tractor proposition, backed by a tractor of high efficiency with splendid service plan in operation, is something you can't afford to overlook if you are going to buy a tractor this year.

Needless to say we couldn't make this new sweeping proposition unless we knew positively from experience that the BEAN TRACTOR would uphold it.

Special Tractor for Orchard and Vineyard

Don't buy a tractor built for general use—it isn't price but results that count. Buy a tractor designed to do your kind of work.

The BEAN is built low to go under lowest branches. Great traction combined with light weight — low fuel expense — best work in soft soil. Turns in 10-foot circle with full power—tools deep in soil. You can turn right back in the same row.

Bean TrackPULL Tractor

The BEAN TrackPULL TRACTOR will be as famous as BEAN POWER SPRAYERS when as many are in use.

Send right now—before you put your money into any tractor —and get this new "After the War" tractor proposition. Then decide which tractor you need. Send the coupon now.

The Cultivator Patterns

9046—**Boys' Suit.** Cut in sizes 2, 4 and 6 years. The blouse hangs straight from the shoulders but is held in place at the waistline by a belt of the material.

9028—**Ladies' Waist.** Cut in sizes 36, 38, 40, 42, 44 and 46 inches bust measure. A soft vest is shirred over a cord to form the graceful round neck.

9009—**Ladies' Shirtwaist.** Cut in sizes 36, 38, 40 and 42 inches bust measure. The collar is quite broad at the front, but is slashed in points to give a novel effect.

9041—**Ladies' and Misses' Coat.** Cut in sizes 16, 18 years, and 36, 38, 40 and 42 inches bust measure. The two piece sleeve is set into a very deep armhole.

9029—**Ladies' Dress.** Cut in sizes 36, 38, 40, 42, 44 and 46 inches bust measure. A narrow shawl collar of organdie with a dainty filet edge follows the line of closing.

9026—**Children's Dress.** Cut in sizes 4, 6, 8 and 10 years. The lower edge of the long waist is curved downward at each side.

9030—**Ladies' and Misses' Two Piece Skirt.** Cut in sizes 16, 18 years, and 26, 28, 30 and 32 inches waist measure. The front gore is fitted and the back gore is gathered all across the slightly raised waistline.

PRICE OF ANY OF THE ABOVE PATTERNS 10 CENTS EACH.

HOW TO ORDER PATTERNS

Write your name and address plainly in full, give correct number and size of each pattern you want, and send 10 cents in coin or (1 or 2 cent) stamps for each number. In order to furnish our readers with the very latest New York City styles, all pattern orders are filled in New York City. Therefore, we promise to deliver all patterns ordered within two weeks. We guarantee safe delivery of all patterns. Address

LOOK PLEASANT

Nobody cares about your woes;
A gloomy face is ungenteel.
Each has his sorrows, goodness knows,
Why should you your grief disclose?
Look pleasant!
"Though you are blue as indigo—
You're prettier when you smile, you know.
The world abhors a gloomy face,
And tales of woe are commonplace—
So let your face no sorrow trace—
Look pleasant.
—Attainment.

THE PRODIGAL FATHER'S NEW YEAR VOW

(Continued from last week.)

NEW YEAR'S eve was one of those clear, moonlit evenings, when one could see, almost could read, any object or newspaper which came within line of vision. So, no wonder that the seedy traveler who had plodded a weary six miles from Canada station halted, wonderingly, as he sighted the huge stone that almost seemed beckoning to him from, he noted with a deathly sinking of his heart, the very center of the Stetson lot in the old familiar hill burying ground. Jake had not meant to be mean or cruel. Charlotte Ann had told him so many times that she wished she "might never set eyes on his ornery face again" that, when his hold on Walt had loosened and he had slipped down the creek and had been cast ashore on a handy knoll, it had occurred to him that now was the chance to make true his wife's wish, and no longer to be a drag upon her. In the two years' loneliness and freedom, however, there had come to him a glimmer of new light. Home took on a broader, sweeter value. After all, in the whole, wide world, there at home were the only people who cared at all for him; the only folks in the universe who would join him sincerely and lovingly with the word "we" when love held sway.

"The onliest pards I ever had, since dad and maw died," he used to think, "and me not sensing it."

And at last, a little success coming to him, he decided to return, to go back, a prodigal father, but with enough of the world's goods to bring joy to the hearts of his people. He had tried to get home by Christmas, but California is a far cry from this little New England village among the hills and he had only just made it.

Now—well, it served him right, he supposed. For there could be no other explanation than that Charlotte Ann was gone. The monument must be to her memory. He should never hear her sharp tongue again, her bitter sneers at his shiftlessness, all so well deserved, as he admitted now. He went over to see the monument. In the moonlight the word "Hero" shone forth resplendently and, as his gaze traveled slowly downward, he was as a man stricken dumb, for awhile. Then he swept his coat sleeve across his eyes. Somehow, he found it hard to see clearly.

"Me, a hero," he ejaculated with self scorn, "me a hero! Why, I'm a deserter; ought to be shot for one, too! Hero! well, not much—but one thing I know is, Charlotte Ann's a heroine and no mistake about it."

Then his heart being full and the surroundings solemn, he dropped on his knees, and with his head on the garland of roses, registered a firm vow, which was always kept, that, if Charlotte Ann would but take him back, he would overcome his besetting sin and be all that she had hoped when she accepted him, for better or for worse, so many years before.

"It's all been worse, Lord," he said, humly, "but the time's ripe for better and it's sure going to be with your help, Lord," he added, suppliantly.

As he finished the old bell on the old church in the valley began to chime the Old Year out and the New Year in, and Jake realized that he had made the biggest, busiest and best New Year's resolution of his life, and he accepted the bell's notes as a token that he should fulfill it, "make good," and redeem his past irresponsibility.

Lottie Ann Junior saw him first. The little family had been watching the birth of the New Year and she had seen him enter the gate. She was not excited. Lottie Ann was both phlegmatic and philosophical.

"Ma," she remarked placidly, "that there monument of ourn ain't no good after all. Here's pa a-coming up the path."

When it was proposed to remove the monument Jake vetoed the idea.

"No," he said, "if it's just the same to you, Charlotte Ann, I'd like it left there. Whenever I feel like dropping back into the old ruts, I'll go up and look at it. It will give me fresh courage and pluck, for, I tell you now, Charlotte Ann, it was that stone that clinched my resolution, nailed it down, so to speak, and I feel real sort of friendly toward that monument. I shan't ever be perfect and—I'm no hero, but whenever I see that stone and read what you believed I might be, I can take a fresh hold and make a bluff at it, anyway."

It is refreshing to be able to add that Lottie Ann appeared out in public the following June in a spick, span pink dress, stockings, sash and kid slippers, all procured for her by the repentant prodigal, who, it is hinted, may be on a political slate for the honorable office of selectman of Hartsville.

Jake smiles at the horoscope. "Guess," he commented, "that it didn't make much difference when a man is born. According to my lights, it's up to us all, whenever our birthday is, to be square and straight. We can all do the right thing, whether we were born in winter or summer," but while these are his opinions, he holds an affectionate liking for the old horoscopic prediction paper, for he realizes that it helped redeem him in the eyes of his energetic wife.—Farmer's Wife.

NEW KIND

The good bishop was dictating his sermon. It was on the evils of indifference, of letting things run along in the easiest way. Rounded sentence after rounded sentence came from the episcopal lips, till he reached the grand climax: "And the days pass into the weeks; the weeks into the months; the months glide into the years—and you are lost—lost in a maelstrom of apathy."

And this reminds us of a delightful bit in a widely published decision of a supreme court justice: "The preponderance of evidence," wrote he, "the preponderance of evidence is one-sided."

LITTLE JACK HORNER, 1919 MODEL

Little Jack Horner don't sit in the corner
Eating a Christmas pie;
The reason is plain, he will explain,
The cost of living's too high.

MUSSELS AND HOW TO COOK THEM

A circular of interest to Californians who live near the coast has been issued by our bureau of fisheries. Mussels are certainly abundant on our coast and to be had for the picking, so we give some of the recipes from this circular.

When Not to Use Sea Mussels

Sea mussels are wholesome, but, as in the case of all animal foods, there are conditions under which they should not be gathered or eaten. Dead or stale mussels are apt to contain the same dangerous decomposition products, ptomaines, as are found in other stale or putrefying animal foods. They should be alive, and this can be determined by observing if the shells be closed. If the shells gap and do not stay closed when squeezed shut the mussels are either dead or weak and should not be used.

Mussels, like oysters, should not be used from sewage polluted waters and, therefore, should not be taken from the vicinity of towns or on densely inhabited shores. They should not be taken from pilings, rocks or shores exposed at low water, as they may become polluted or the liquor may become slightly decomposed by exposure to the warm air and sun. If these simple precautions be observed, mussels will be found to be a safe and healthful sea food. Keep them covered with a wet cloth in cool, dark place.

How to Prepare and Cook Sea Mussels

Wash well before cooking. The only inedible part, except the shell, is the little tuft of black hairs known as the byssus, or beard, which is readily detached after cooking.

Canned mussels of good quality, preserved either in their own juice or pickled in vinegar and spices, are now prepared by a few firms on both Atlantic and Pacific Coasts. Thus prepared they retain their tenderness and most of their natural flavor.

Mussels may be cooked in the same ways as oysters and clams, and in other ways distinctly their own.

Steamed Mussels

Wash and clean thoroughly; place in closely covered saucepan or kettle after adding about a cup of water to one-half peck of mussels. Boil 10 to 12 minutes, until they are all well opened. Strain the broth and serve the mussels on a large platter. Serve them with some melted butter, and a cup of broth to each person. Remove the beard and eat same as steamed clams. One-half peck of mussels will serve five people.

Fried Mussels a la Colbert

Wash and clean as usual. Steam until shell opens. Remove the meats from the shells, and take out the beard; then roll in flour, dip in two eggs beaten with one-half cup of milk, and roll in bread crumbs. Fry in hot fat or oil. Drain and dry well on a napkin. Serve hot with a Colbert sauce made as follows: Boil down a gill of brown sauce and meat extract the size of a nut; while whipping the sauce put in two ounces of butter, the juice of a lemon and some chopped parsley.

Mussel Broth

Wash and clean as usual. Place in closely covered kettle, adding a pint of water to one-half peck of mussels, a sliced onion, and a piece of celery, if at hand. Boil until the mussels are all opened. Strain the broth and serve in cups. A little whipped cream may be served on the side. The mussels

used for that purpose can be saved for creamed, patties, etc.

Mussel Chowder, New England Style

Clean and cook the mussels as usual. Remove the meat; take out the beard, preserving the broth or liquor in another dish. To a half peck of mussels take three ounces of salt pork, cut in small dice, and fry in a kettle; add two onions, sliced, and cook well, but do not let brown; add a teaspoon of flour; stir well. Then add the liquor with the same amount of water. Let it come to a boil, and add three potatoes sliced thin. Boil slowly until they are done, then add the mussels and a pint of boiling milk. Season well, and serve with pilot or soft crackers.

Mussel Croquettes

Clean and scald the mussels as usual. After removing the meats from the shell, take out the "beard," and cut the mussels in very small dice. Make a cream sauce, using two ounces of butter, one and a half ounces of flour, one-half pint of hot milk, one-half pint of hot mussel liquor; boil it down until thick enough; add the mussel meats and the yolks of two eggs; mix well, and put in a pan to cool. When thoroughly cold, shape into croquettes, bread in the usual way, and fry in very hot fat. Drain and serve on a folded napkin garnished with parsely.

Mussel Fritters

Clean the mussels as usual and steam until all are opened. Remove the meats, chop them up not too fine. Make a batter with four ounces of flour, teaspoonful of olive oil, three eggs, salt and pepper, and one-half teaspoon of baking powder. Mix well and add some of the mussel liquor to thin out. Mix in the mussel meats and fry in hot fat a golden brown.

Mussel Chowder, New York Style

Take one-half peck mussels, clean, wash, and steam. Strain the liquor and keep hot in a separate dish. Take the meats out of the shell, remove the byssus, and cut mussels in two if large; if not, leave whole. In another kettle fry three ounces of salt pork cut in very small dice. When well fried, add two onions and one green pepper, cut in small dice also; fry a few minutes; add the liquor with the same quantity of water and two large potatoes diced; boil until the potatoes are cooked; add two tomatoes, peeled and chopped up; boil a few minutes more. Put in the mussels and sprinkle a little thyme leaves and serve.

Creamed Mussels

Prepare the mussels as usual. Make a cream sauce thus: Take three ounces of butter, place in saucepan, when melted add two ounces of sifted flour. Stir well while cooking and do not let the mixture brown. Add a pint of hot milk and one-half pint of mussel liquor and cook thirty minutes. Season to taste with salt, pepper and nutmeg. Strain and add mussel meats. Serve on toast, or in patties, shells, croustades, etc.

Charity is a cloak that covers a multitude of amateur theatrical performances.

Shall we give our best in men and not in food?—U. S. Food Administration.

Some see with the brain; some only with the eye.

Only the simple life is honorable or even decent today.

You can't eat your sugar and give it to the soldiers too.

The sugar S. O. S. is a do-it-now call.

WASHING SECRETS

The theory that "everything comes out in the wash" will not hold good in the case of certain stains. All stains should be removed before washing The material of which most soaps are made is of such a nature that it produces a chemical action that sets the stain—making it impossible, or very difficult, to remove later.

Stains come from a great variety of sources, like ink stains, rust, grease and grass stains. The most common of all, however, are fruit stains.

Fruit Stains

The first step in successfully removing fruit stains is to hold stained part of the fabric tightly over a basin. Then pour boiling water, either direct from tea kettle or from a pitcher, through the stain. In many cases this will be all that is necessary before the regular washing.

It sometimes happens that a fruit stained article gets into the wash unnoticed. In this event a brown spot will usually be seen after the laundering. It should be immediately dampened and placed on ice. This operation may have to be repeated several times, but it is usually successful.

An efficient aid in removing fruit stains from napkins and table cloths is spirits of camphor. Wet the spot with a little camphor. When the articles are laundered the spot will disappear. The camphor must be applied, however, before any water touches the spot.

Peach stains can be removed from table linen and clothing by applying pure glycerine to the stain. Let it remain for a short time, and then wash in clear water. Peach stains in white fabrics can be removed by bleaching with Javelle water. After applying a few drops to the stain, use boiling water immediately. Rinse thoroughly.

Ink Stains

Next to fruit, ink is probably the most prolific source of spots. Ink stains have always been regarded as fatal to clothing. As a matter of fact, ink is one of the easiest stains to remove—especially if immediate action is taken.

The ink spot should be washed at once, while the ink is still wet. Use cold water and wash until spot disappears.

If the spot is old, or does not yield to the washing process, wet with milk and then cover with salt. Obstinate ink spots made by certain kinds of ink can be removed with turpentine. Soak the spot, let it stand for several hours, and then rub well. This usually removes the ink, and does not injure colored fabrics.

Another method is to wet the spot with cold water. Then drop oxalic acid solution on the stain. After allowing to stand for a few seconds, rinse in water containing ammonia.

Or, apply one or two drops of oxalic acid to the stain with a dropper. Then one or two drops of Javelle water. Rinse in hot water.

When everything else fails, try peroxide of hydrogen. As this chemical is a strong bleaching agent, however, it should not be used on poor quality colored material. Fine quality silks and other fabrics in which high grade dyes have been employed will withstand the bleaching action. It is also safe to use on fine white lawn waists.

The method of applying peroxide of hydrogen to ink stains is to wet the spot thoroughly, and then put in the sun to dry. Remove as soon as the ink spot disappears.

Peroxide of hydrogen will also be found valuable in removing other stains if the fabrics are of good quality.

Rust Stains

To remove rust stains, use a mixture of salt and lemon juice. Put the spot in the sun while still wet.

Oxalic acid is excellent for removing stains caused by iron rust. The following method can also be used for iron rust with success:

Put one quart of water and a teaspoonful of borax into a bowl. Over this lay the stained goods. Then apply diluted hydrochloric acid drop by drop until the stain brightens. Then dip immediately into water. Repeat if stain does not disappear at once. Rinse in water containing ammonia, or borax.

Coffee Stains

Coffee stains are removed by the boiling water method described under fruit stains.

Chocolate or Cocoa Stains

To remove these stains from table cloths, napkins, etc., sprinkle borax on the stains, and then wash in cold water.

Or, they can be washed in cold water containing borax, or a little soap. Never use hot water, which sets the stain.

Paraffine Spots

As a rule paraffine can be removed with chloroform. Another very simple way is to lay a piece of blotting paper over the spot and apply a hot iron. The heat melts the paraffine and the blotting paper absorbs it.

Iodine Stains

Iodine that has been applied to bruises frequently stains the clothes. The spots can be removed by washing in ammonia water.

Grass Stains

These can be easily removed by soaking with kerosene, allowing article to stand awhile and then placing in the wash.

Grease Stains

A hot iron and blotting paper, used the same as for paraffine, will remove grease stains. As a rule, however, it is only necessary to wash the spots in cold, soft water and soap. Ice water or cold rain water is best.

This method is also serviceable in cleaning grease that has come from automobiles. In cleaning automobile grease spots, however, it is best to rub a little lard into the spot before washing.

The treatment of wagon grease is slightly different, owing to the presence of graphite in the grease. Rub lard into the spot, and then wash in warm water and soap suds.

Grease spots in silk or woolen goods can be taken out with kerosene. Gasoline is frequently used, but kerosene has proved the best. While taking a little longer to evaporate, it does not leave the circle while gasoline usually does. Care must be used in not allowing dust to settle on the spot until dry.

Vaseline Stains

Washing with turpentine removes vaseline stains from cloth. Do not boil, or put very hot water on a vaseline stain, as this will set the spot.

Blood Stains

After fabric has been allowed to soak in lukewarm water, wash with soap and warm water.

Oil Stains

These come most often from the sewing machine. A cloth dipped in turpentine and rubbed gently on the spot will remove the oil.

Mustard Stains

Washing in hot water containing a little ammonia will remove the stain caused by mustard.

Egg Stains

Soaking in cold water, and slowly heating will usually remove such stains as egg, meat juice, cream, oil, etc.

WAS $100 — NOW $57

Here is the famous Oliver Typewriter offering you a saving of $43. The $57 Oliver is our identical $100 model, brand new, never used. Not second-hand nor rebuilt. The same as used by many of the largest concerns. Over 700,000 sold. We send it Oliver for Free Trial. Not one cent down. If you want to keep it, pay us at the rate of $3 per month until the $57 is paid. This is the greatest typewriter bargain in the world.

LIVESTOCK

The market continues strong for steers of good quality, and buyers are expecting that the market will continue high until the grass stuff begins to arrive.

The market for good cows is also strong. Retail buyers preferring good cows to the plainer steers.

The prices for top hogs of the desired weights and quality show an advance, and there is reason to expect higher levels. Good hogs are scarce. The commoner stuff is in no greater demand than in the past.

Good quality lambs are higher, but the common and medium lambs are weaker.

Wethers are strong and scarce.

The market for good ewes is improving. Heavy and shelly ewes are finding no demand.

Report of live stock conditions on the Los Angeles market as compiled by the United States Department of Agriculture, Bureau of Markets, through the local office:

Pears—Bulk basis: Fy., 19½; extra ch.

17; ch., 15½; standard, 12@14.

Apples—Lb.: Extra ch. to the evaporater, 13½; jobbing price, 14½.

Apricots—Standards, 9½; ch., 13; extra ch., 14½; fy., 16; extra, 17½; Moorparks, 19; slabs, 11.

RICE

Prices which rice millers of this state have voluntarily agreed with the food administration for California to pay to growers for paddy rice are as follows:

No. 1 and No. 2 Japan, in sacks, $4.32 per 100 pounds.

No. 3 and No. 4 Japan, in sacks, $4.16 per 100 pounds.

Prices for other grades will be paid for on a basic value proportionate, and no higher prices than those quoted above for any grades whatever will be paid.

The millers agree further to sell cleaned rice and by-products for prices not to exceed the following:

Fancy Japan, 1½c per pound.
Choice Japan, 7⅝c per pound.
Fancy second heads, 6⅞c per pound.
Screenings, 5⅝c per pound.
Brewers', 5¼c per pound.
Rice polish, $50 per ton, carlots.
Rice bran, $36 per ton, carlots.

NUTS

The Almond Growers' Association has established opening prices as follows per pound:

Nonp.	27¼
I.X.L.	25½
Ne Plus	24½
Drake	20

Outside dealers have named prices above these quotations and it is understood association stock is practically closed out and prices withdrawn.

Walnuts: Net prices have been named by the California Walnut Growers Association:

No. 1 Softshell	28
No. 2 Softshell	25
Jumbo	30
Fancy Budded	31½
Golden Gate Budded	29

Franquettes, Eurekas and other fancy varieties sold on sample. No. 1 Softshell guaranteed 88 per cent good; Fancy Budded, 90 per cent. In case of worms or damage by ants not more than five per cent.

BEANS

Per cental:

Limas	11.00
Large White	8.00@8.25
Small White	9.40@9.50
Blackeye	5.40@5.60
Pink	6.75@6.90
Bayou	7.25@7.40
Red	7.00@7.25
Cranberry	8.25@8.50

HONEY

Cash to producers, country loading points:

Extracted, Water White, supplies very light, 22@23½; White Sage, supplies very light, 20@23; Light Amber, supplies very light, 18@20½; Dark Amber, 18@19 lb.; Beeswax, supplies moderate, 35@40 lb.

GRAIN

Wheat—Following are net weight prices for bulk grain, based on federal standards and grades at San Francisco Bay and Los Angeles terminals:

Hard Wheat—	Per Bushel	Per Cental
No. 1	$2.20	$3.62 2-3
No. 2	2.17	3.61 2-3
No. 3	2.13	3.55
Soft White—		
No. 1	$2.18	$3.63 1-3
No. 2	2.15	3.58½
No. 3	2.11	3.51 2-3
Club and Sonora—		
No. 1	$2.16	$3.60
No. 2	2.13	3.55
No. 3	2.00	3.48 ½

For sacked grain add nine cents per bushel of 60 pounds to above price. Deduction of three-fourths of a pound is made for weight of standard grain bags. Wheat grading under No. 3 and mixed or smutty wheat will be purchased according to merit.

Barley — Feed, 2.17½@2.22½ per cental for choice spot; shipping, 2.25-2.27½; milling, nominal.

Oats—Red feed, 2.35@2.55 per cental; seed, do, 2.85@3.00, with recleaned at 3.15@3.20.

Corn — Egyptian, 2.75@3.00 per cental for choice white; Milo, 2.65@2.70. Rye nominal.

HAY

Under date of December 28, Scott, Magner & Miller says:

Receipts past week 573 tons. All quotations are practically nominal and probably will be so until after the holiday season. Damaged alfalfa still arrives from the river districts as well as at times from interior sections. This hay is arriving in worse condition right along as each succeeding rain has its effect upon it. It is difficult at times to even obtain freight and baling charges from this hay and if it continues to be sent to this market no doubt consignors will be receiving bills back for charges. The present is no time to consign hay to this market. It is generally believed in the trade that after the first of the year business conditions will improve like all preceding seasons.

We quote today wholesale prices in carload lots as appear from dealers' transfers upon the hay market. For prices to consumers charges of cartage, commission and handling expenses must be added according to conditions.

Fancy Wheat Hay (light 5 wire bales)	24.00@26.00
No. 1 Wheat or Wheat and Oat Hay	22.00@24.00
No. 2 Wheat or Wheat and Oat Hay	16.00@20.00
Choice Tame Oat Hay	21.00@23.50
Other Tame Oat Hay	16.00@19.00
Wild Oat Hay	16.00@18.00
Barley Hay	16.00@18.00
Alfalfa	14.00@18.00
Stock Hay (in order)	14.00@17.00
No. 1 Barley Straw, bale	50@80

Damaged hay, all kinds, according to condition.

SEEDS

Flax	8@8¼
Millet	5@5¼
Rape	2½@5

Citrus Fruit Market

Los Angeles, Dec. 31, 1918.

Citrus interests have never been given a better holiday market. There was, however, an enormous quantity of fruit which would stand up under the 8 to 1 test but which refused to color on the tree. This caused a vast quantity of sweating or artificial coloring. This put much of the fruit to the bad and three and even five per cent of decay has been reported on some cars. Some of this stuff was thrown into the New York auction after Christmas and sold for disastrous prices. In the main however, the situation has been exceptionally good. F. o. b. quotations are now running around $3.75 to 4.25.

The lemon market is fairly satisfactory. Fruit condition is fine and the auction markets are taking all offerings, usually above $2.00 and sometimes as high as $4.60. The cold of the past few days has caused little concern and where orchard heating has not been followed young fruit has been destroyed.

Shipments

Shipments of citrus fruits to date since November 1, 1918: Southern California; oranges 1533 cars, lemons 1149, total 2685. To same date last season, oranges 2104, lemons 526, total 2630. Central California this season; oranges 2704, lemons 238, total 2942. Last season to same date; oranges 1647, lemons 60, total 1707. Northern California; oranges 205, last year same date 181.

AT THE AUCTIONS

December 30

New York: 22 cars Navels, 1 mixed, 1 Arizona, 9 lemons. Lower. Nav. 1.00-6.30, lem. 240-3.95. Ariz. Navels 4.35-4.95.

Philadelphia: 3 Nav., 2 lem. Lower. Nav. 1.80-3.90, lem. 2.55-4.35.

Cleveland: 7 cars. Higher. Nav. 3.90-6.00, lem. 2.90-3.85.

Boston: 9 cars. Nav. 4.25-6.25, lem. 2.95-3.75.

Cincinnati: 3 cars, easier. Nav. 3.15-3.60, lem. 2.55-3.85.

Pittsburg: 4 Nav. 2 lem. Nav. 3.20-6.70. Philadelphia: 5 Nav. 2 lem. Nav. 1.80-4.85, lem. 2.05-3.45.

PARTIAL LIST CALIFORNIA FRUIT AND VEGETABLE SHIPMENTS

From post card reports to the Los Angeles branch of the bureau of markets, report is made of the following shipment of cars of products from California for the week ending December 30: Apples, 65; cabbage, 3; carrots, 3; cauliflower, 26; celery, 73; dried apples, 1; dried apricots, 3; dried beans, 65; dried figs, 4; dried peaches, 7; dried pears, 1; dried peas, 1; dried peppers, 3; dried prunes, 33; lettuce, 39; mixed vegetables, 44; mixed fruit and vegetables, 4; mixed dried fruit, 28; olives, 3; onions, 9; potatoes, 83; raisins, 208; sweet potatoes, 10; tomatoes, 2; Arizona potatoes, 2; Nevada potatoes, 2.

QUICK RELIEF

Tobias Knowal peeped through the window of his office, then tiptoeing to his desk put a flannel bandage around his neck, put his arm in a sling, ran his hands through his hair and limped to the door.

"Mr. Knowal?" inquired the caller.

"Yes," groaned Knowal. "What can I do for you?"

"You appear to be far from well," said the caller.

"Appear to be!" echoed Knowal. "Do you think I'm doing this for fun? But what can I do for you?"

"Oh—er—I won't trouble you now," said the caller hurriedly. "Any time will do." And he departed.

"It's some trouble," murmured Knowal, pulling off his bandage. "But it's really the quickest way to get rid of these life insurance agents. That one won't trouble me again, anyhow!"

WEATHER CONDITIONS

For Sale

My ranch on Putah Creek. Location three miles from Dixon 1½ miles off state highway and 8 miles from Vacaville, Solano County. Consisting of 320 acres richest sandy loam of which 100 acres are in bearing almonds where smudging never has been necessary.

One hundred sixty acres of five year old alfalfa, balance in grain.

Two good pumping plants furnishes plenty of water.

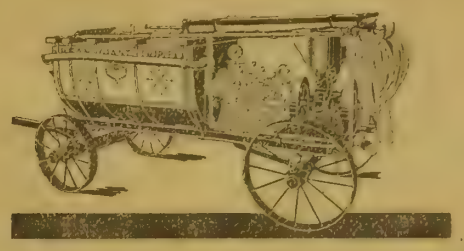
All buildings in excellent order. Will sell orchard separate or together with the alfalfa and grain land.

Easy terms. For further particulars write or see owner.

S. H. Fountain
Dixon, Calif.

"The BEAN is the Best"

Clean Trees Bring in the Money



Messy, scaley trees have no vitality. The mess and scale sap the very life from the trees—the crops are small—and the fruit inferior.

But trees that are clean—and healthy—produce BIG! It costs less to spray—than to suffer the loss that results from not spraying.

Do the Work Right!

You must have a sprayer that will drive the material onto the trees under heavy pressure, so that the job is thoroughly done.

You must have a sprayer, too, that will work right along day in and day out without trouble. That's why you should get a Bean.

BEAN POWER SPRAYERS

Check the coupon. Write your name and address clearly, and send for our new catalog of Hand and Power Sprayers.

I have ..... acres of ..... and am interested in ..... Power Sprayers ..... Hand Pumps ..... Accessories.

Name .....
Address .....

The Famous Hardie Junior is a Real Power Sprayer.

It has sufficient capacity, for two lines of hose. It has plenty of power for high pressure effective spraying. It is little in first cost, engine power, pump capacity and ability to do successful spraying. WE believe this is the greatest small power sprayer ever manufactured, and placed on the market with phenomenal success in every fruit section in United States and vouched by thousands who own the Famous Hardie Junior. Equipped with 1½ h.p. engine, battery ignition, 150-gallon tank with mechanical agitator, capacity of four gallons per minute with a steady working pressure of 200 pounds, and two 25-foot of the best spray hose, fitted with spray rods and nozzles; 4-inch tire truck with pole or shaft.

ALL FOR $300. DELIVERED ANYWHERE IN THIS STATE.

If truck is not needed, deduct $55.00.

These prices are subject to change without notice. The wise buyer will place his order now.

This low price is made possible by big production.

If you are interested in other types and sizes of the HARDIE POWER SPRAYER write us for the big spray catalog, and learn why we can offer more spray pump value than any other spray pump manufactured.

The Hardie Orchard Gun Is Now $12.00

none better, all guns are guaranteed to satisfy the user or their money refunded. The Hardie spray hose is the safest hose to buy.

The FARMER says=

"for stumping genuine GIANT has no equal"

From recent letters of ten farmers who have used Giant Powders for Stumping we make these extracts:

"1. Your Giant Farm Powders shoot the roots. 2. They have wide breaking power and less bad gases than others. 3. I get the same excellent results from them every time. 4. They are always uniform. 5. I used eleven tons and wouldn't have any other make. 6. I want to sell a lot of other powder that I have because Giant does the work much better. 7. Genuine Giant can't be equalled. 8. I don't have to use so much powder when I blast with Giant. 9. You know what we need for stumping. 10. I save money by using Giant Powders."

Write today for our free book, "Better Farming With Giant Farm Powders." It tells how to save money and get better results in stumping, ditching, tree-planting, etc.

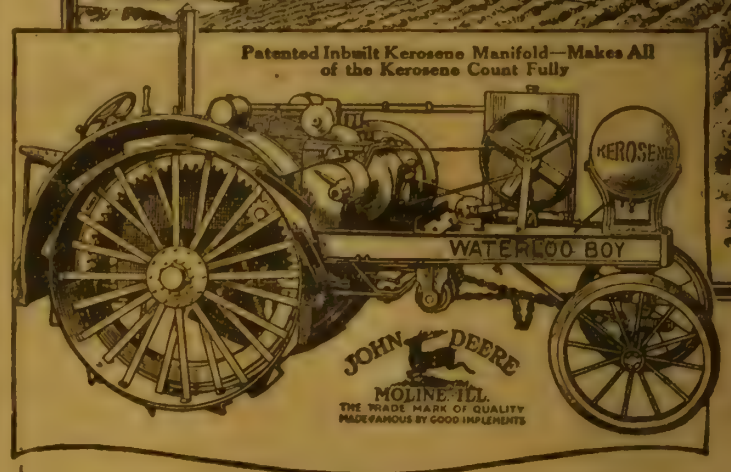
WATERLOO BOY

ORIGINAL KEROSENE TRACTOR

Whether your soil is hardpan, black-wax, timothy sod, gumbo or just loam, the Waterloo Boy Kerosene Burning Tractor has the necessary power to farm it. Our thousands of satisfied users all over the United States have given this tractor rigid tryouts in every possible soil condition, and the Waterloo Boy has always pulled through with a record.

Perfect Lubrication Necessary to Efficient Work and Long Life

The teeth of friction get busy quicker on a tractor than on other machines, because of the trying circumstances under which it must work. No matter how well your machine is built, it can not do good work unless the lubricating system is right.



The Waterloo Boy is equipped with the well known circulating splash and pump system of lubrication, which is employed on high class automobiles generally. This constantly maintains a substantial oil flow between all friction points. With dust-proof gears and bearings, it prevents wear, increases power, keeps down repair expense, insures smooth, steady work.

High quality material and workmanship throughout guaranteed.

Write us for illustrated catalog showing many photographic views with letters from users, also details of construction.

Bigger fruit crops are needed Use Planet Jr. tools

With Planet Jr tools you can do more thorough, more rapid cultivation, save time, labor and money, and get bigger and better crops because of their superior design and scientific construction. They last a lifetime. Fully guaranteed.

No. 41 Planet Jr Orchard Cultivator does such thorough work in orchard, vineyard or hopyard that bigger and better crops invariably follow. Exceptionally light draft adds to the ease of operation and rapidity of cultivation. The strong frame carries teeth, sweeps, irrigating steels, plows, alfalfa teeth and special weeders. Has tree-shield, side-hitch for low trees, and fore-carriage if wanted. Works deep or shallow, and cuts 4 to 6½ ft. wide.

No. 8 Planet Jr Horse-Hoe does a greater variety of work in corn, potatoes, and other crops requiring similar cultivation, and does it more thoroughly, than any other one-horse cultivator made. It is stronger, better made and finished. Lasts longer. Its depth regulator and extra long frame make it steady-running. Cultivates deep or shallow and different widths of rows.

72-page Catalog, free!

Illustrates Planet Jrs doing actual farm and garden work, and describes over 55 different tools, including Seeders, Wheel-Hoes, Horse-Hoes, Harrows, Orchard-, Beet and Pivot-Wheel Riding Cultivators. Write postal for it today!

CALIFORNIA CULTIVATOR

and LIVESTOCK and DAIRY JOURNAL

Los Angeles — An Illustrated Weekly for the Rural Home and Ranch — San Francisco

Vol. LII — January 11, 1919 — No. 2

A HARVESTER in your fields costs you money—every day. You're right to keep it working every single minute you can.

You put every available man you have with that harvester. Speed it up! Your grain—well, you haven't time, if you are going to keep that harvester humming, to do more than sack it and dump it on the stubble.

There's the rub—as a whole lot of us know from sad experience.

An Early Rain Comes!

The grain becomes water-soaked and heavy. The weak place in the sack gives way. The rats and gophers help. The stubble started another rip. Your grain is leaking out—being wasted. A great quantity of it in the sack moulds—and even sprouts—before it gets to market.

California experts found that early rain was the direct cause of a loss of ten per cent of last year's crop of grain—many hundreds of thousands of bushels sacrificed to sack handling.

The bulk way of handling grain is the economic—the safe and more profitable way. Calco Metal Grain Bins are made to save that wasted one-tenth, and keep the other nine-tenths clean and sweet for market. Calco Bins are proof against weather, vermin, birds, thieves and fire. Read the free booklet, "Calco Grain Bins." It tells how one man figured his labor and hauling costs the sack way—and how he saved by handling his grain in bulk. Perhaps you know him. Write for the book—now. It's entirely free.

OUR ADVERTISERS RELIABLE

We guarantee our subscribers against loss through dishonesty of any advertisers in the Cultivator. We do not attempt, however, to adjust trifling differences between subscribers and honest, responsible advertisers, nor will we pay the debts of honest bankrupts. Notice of complaint must be sent us within 30 days from date of the transaction, and the subscriber must have mentioned the Cultivator when writing the advertiser.

THIS WEEK'S COVER

California's $10,000,000 walnut crop has place of honor on the cover page of this issue. A young California walnut grove is there shown.

This has been the walnut grower's most profitable year, most profitable in that a great acreage has this year produced its first crop and all groves have produced well up toward the maximum. The total this year is 16,800 tons, almost entirely sent to Eastern markets.

DAVID LUBIN

David Lubin founder of the International Institute of Agriculture, and regular American representative at the institute, died in Rome, Italy, January 1. While a native of Poland, Lubin spent much of his life in California, coming here in '67. For a short time he was in Arizona, later returning to San Francisco and Sacramento where the greater part of his business life was spent in connection with the firm of Weinstock & Lubin.

Many years ago he began the agitation which led to the formation of the International Institute of Agriculture. He failed to get the support he desired in this country and took the matter to Europe, where finally King Victor Emmanuel of Italy took up the plan with him and endowed the institute with $60,000 per year. At first America was backward in making Mr. Lubin regular representative of this government. Ultimately, in 1910, he was appointed. By 1912, 50 nations had become contributors to the plan, Russia being the last. Statistics of crops, especially wheat, are gathered the world over and made available to the subscribing nations.

THEODORE ROOSEVELT

The most characteristic American, and the most interesting one, is dead. Impetuous in words, yet almost invariably conservative in action, he had made more friends, possibly more enemies, than any president this country has had. Speaking of his virtues and faults the Los Angeles Times says:

"Roosevelt loved America and everything about her. He loved her political fights; he loved her fierce young recklessness; he loved her crude faults and her innate sturdy virtues.

"Roosevelt was amazing; he was young America. He was the spirit of a young giant. He had the exuberance of youth; his was the tenderness and the cruelty of youth; his was the wild love of life and the eager thirst for knowledge that goes with young blood.

"His faults we do not deny; but he was a force for good that rang through the world like a bugle call to arms."

TWO CHAMPIONS

This week we chronicle the achievements of two dairy cows—our own famous Tilly Alcartra and Sophie's Agnes of Hood Farm—both have established new world's records for their respective breeds.

New dairy production records are established with such regularity that the reporting of them begins to approach the routine. One no longer asks the question: When will the limit be reached? Apparently there is no limit!

There are several facts in connection with sensational records that should be carefully considered by the average dairyman as they can be applied to their own operation with profit. First, world record cows are not accidents. They are invariably well bred. They are from proven sires and dams, grand sires and grand dams. They are usually proof of "individual excellence through inheritance." Second, high production is largely the result of supplying proper feeds and proper care.

Good breeding, rational feeding and efficient management are the three cardinal principles of successful dairying. There is scarcely a dairy herd in this state that will not respond to such a combination.

The advocates of long distance tests are now furnished added argument to use in their sensible campaign against the seven and thirty day test.

It is one thing to register high production for seven days, but it requires a real cow to last a year out and a super-cow to come back, year after year.

FORM D 1

On page 5 of the last issue of the Cultivator under the title, "Income Tax," we quoted from a circular issued by Internal Revenue Collector Carter of the Los Angeles district. In that Mr. Carter suggested that a special form of income tax return, designated as Form D 1, has been provided for the use of individuals whose incomes are derived from farming or ranching operations, and the suggestion followed to write his office for such blanks. The revenue office has found, however, that while these blanks are available and are valuable to farmers in giving an idea of the general form of return to the government, it will be necessary to make the return to the office on blanks which will not be issued until the new bill now before congress has passed. Under the old law it was specified that the return should be made prior to March 1, but it was found necessary last year to make extension of the time. The collector says that without question the bill now before congress will prescribe either a later date or give for the first year an extension of time, for it will be impossible to prepare these blanks and get them in the hands of farmers so as to make report by March 1. Meantime anyone wishing general information which may be had from these old forms probably can secure them by writing Collector of Internal Revenue, Federal Building, San Francisco or Los Angeles.

COLD WEATHER

The weather surely was cold on Thursday, January 2. It was likewise reasonably, or unreasonably, cold on several other nights thereabouts. The frost fighters had opportunity to use their equipment anywhere from seven to eleven nights, according to the locality, with the result that thousands of dollars worth of citrus fruits have been saved and hundreds of tourists and trades people disgruntled because of the soot. It is unfortunate that the orchard heater has not been perfected so as to give complete combustion to the grade of oil which economy demands. It is possible that such a heater may be secured, but present prices of steel prevent very enthusiastic investigation. The best grade of heater now developed, under present steel prices, costs between three and four dollars. One hundred per acre, which is the usual requirement, makes the overhead cost, by the time oil, tanks, and everything are considered, almost prohibitive. It is to be hoped, however, that the smudgless heater will yet be developed, for it will be welcomed both by the orchardist who wishes to secure more perfect combustion of his fuel and by the trades people who wish to preserve their goods. Meantime the cold weather has passed and the orchardists generally believe the danger for the season is passed also.

The percentage of fruit injured can not be even approximated this soon. The hopeful say five per cent. The hopeless say 50 per cent. Neither are right.

PLANT PEACHES

The advice given in the head above is perhaps entirely superfluous at this time for it is within the memory of the youngest inhabitant that dried peaches are selling around 12 cents per pound and $70 per ton for good canners with perhaps considerably longer price for fresh shippers. Hence the planter is planting without waiting for our advice.

But we are writing this editorial for the purpose of saying "We told you so." Way back in 1916 when dried peaches were selling around three or four cents, or at most with another fraction added, we said on editorial page of the issue of January 13, 1916:

"Last season was one of general financial depression, and peaches seemed to get more than their share of that depression, but those who properly grew their fruit are realizing that peaches are still a staple. At the present time a satisfactory condition obtains in the market and the fruit is selling well. In any case we would advise the owner of a profitable peach orchard to give it the very best of care. Only a few weeks since in driving through one of the best peach producing sections of the San Joaquin Valley we saw many orchards being made into firewood. We did not stop to learn the reason, and some of these orchards may have been diseased or there may have been a good reason why they should be uprooted, but as in every case the uprooted trees were peaches we could not help but feel a serious mistake was being made. So we pass along the word to the far-sighted orchardist: Is it not wise to plant peaches of a good canning, drying or shipping variety?"

Or going back into 1914 we note in an appeal made by Geo. C. Roeding for a higher grade of fruit he made the prediction that if the grower would produce highest quality of fruit, dry it without the "fuzz" and put it on the market in attractive shape the growers "will have no difficulty in selling their product at from 10 to 12½ cents per pound." Mr. Roeding's prediction has been made good.

California peaches have a wonderful reputation in the East. "Your California dried peaches are so rich and meaty and without "that fuzz" that we buy quantities of them," recently remarked a Northern Ohio housewife to the Cultivator editor.

LEAGUE TO ENFORCE PEACE

The friends of the movement to form a league of free nations, which shall have legislative, judicial, administrative and executive powers and whose weapons shall be moral, diplomatic, economic and military, are increasing every day. Every day it becomes plainer that the soul of the German people isn't licked but remains as militant and determined as ever to dominate in the world.

This league to enforce peace shall have as its harter members the nations associated in winning the war against Germany, and when the peace conference has perfected its plans presumably other nations will be admitted. And unless this league is formed during the peace congress the opportunity may be lost forever. The victory program as outlined by ex-President William H. Taft and his coworkers, which was adopted by the executive committee at a recent meeting in New York, is as follows:

The war now happily brought to a close has been above all a war to end war, but in order to ensure the fruits of victory and to prevent the recurrence of such a catastrophe there should be formed a League of Free Nations, as universal as possible, based upon treaty and pledged that the security of each state shall rest upon the strength of the whole. The initiating nucleus of the membership of the league should be the nations associated as belligerents in winning the war.

The league should aim at promoting the liberty, progress and fair economic opportunity of all nations, and the orderly development of the world.

It should ensure peace by eliminating the causes of dissension, and by deciding controversies by peaceable means, and by uniting the potential force of all the members as a standing menace against any nation that seeks to upset the peace of the world.

The advantages of membership in the league, both economically and from the point of view of security, should be so clear that all nations will desire to be members of it.

For this purpose it is necessary to create—

For the decision of justiciable questions, an impartial tribunal whose jurisdiction shall not depend upon the assent of the parties to the controversy; provision to be made for enforcing its decisions.

For questions that are not justiciable in their character, a council of conciliation, as mediator, which shall hear, consider, and make recommendations; and failing acquiescence by the parties concerned, the league shall determine what action, if any, shall be taken.

An administrative organization for the conduct of affairs of common interest, the protection and care of backward regions and internationalized places, and such matters as have been jointly administered before and during the war. We hold that this object must be attained by methods and through machinery that will ensure both stability and progress; preventing, on the one hand, any crystallization of the status quo that will defeat the forces of healthy growth and changes, and providing, on the other hand, a way by which progress can be secured and necessary change effected without recourse to war.

A representative congress to formulate and codify rules of international law, to inspect the work of administrative bodies and to consider any matter affecting the tranquillity of the world or the progress or betterment of human relations. Its deliberations should be public.

An executive body, able to speak with authority in the name of the nations represented, and to act in case the peace of the world is endangered.

The representation of the different nations in the organs of the league should be in proportion to the responsibilities and obligations they assume. The rules of international law should not be defeated for lack of unanimity.

A resort to force by any nation should be prevented by a solemn agreement that any aggression will be met immediately by such an overwhelming economic and military force that it will not be attempted.

No member of the league should make any other offensive or defensive treaty or alliance, and all treaties of whatever nature made by any member of the league should at once be made public.

Agricultural News Notes of the Pacific Coast

Northern California

Locke, Sacramento County, is shipping about eight cars of celery daily.

Nevada County red apples have commanded long prices the past season.

The Sutter Community Club contemplates uniting with the farm bureau.

More than 27,000 carloads of fresh deciduous fruits were sent from California in 1918.

An order has been placed for 55,000 pear trees to be planted in one Yuba County orchard.

The planting of prune trees in 1919 in the Sacramento Valley will be the largest in many years.

Placerville's shipments of cream are steadily increasing. The weekly total is now in excess of $500.

Gridley, Butte County, contemplates the establishment of a factory for the handling of dried milk products.

The next regular fat hog sale of the Shasta County farm bureau will be held at Cottonwood, January 14.

The Yolo Orchard Company finds success in raising alfalfa between orchard trees and pasturing to hogs.

Deputy State Horticultural Commissioner Weldon says there is plenty of room for more pear orchards in California.

The Iron Canyon irrigation project is expected to be given support by state legislation during the coming season.

One fruit grower near Placerville spends his spare time in running a tunnel under his farm, tapping a rich bed of gold bearing gravel.

The rice growers have made investigation as to best varieties of rice, and while they find there are many varieties, the one known as Wateribune is generally preferred.

Eldorado County's farm bureau members are discussing pear blight, the eradication of which will be taken up under direction of County Horticultural Commissioner Hassler.

County Adviser Baade of Napa is recommending the grafting of unprofitable fig trees to more desirable varieties. Some trees grafted in June last bore fruit the same season.

The rice growers anticipate the passage of a bill by the present legislature, the principal feature of which will permit control of noxious weeds infesting rice growing sections.

Grass Valley, Nevada County, reports many pear orchards coming into bearing this season, which will greatly increase the output. Loma Rica Ranch alone will have over 200 acres. These new fruits are principally Bartletts.

Placer County's farm bureau meetings: Penryn, Monday, January 14; Bowman, 15; Long Valley, 17; Gold Hill, 20; Colfax, 22; Mt. Vernon, 24; Roseville, 27; Loomis, 29; Butcher Ranch, 31. Annual directors meeting today, January 11, Auburn.

Pea growers of Alameda County have formed the California Pea Grower Sales Organization. The members retain a certain amount of independence and receive checks direct from purchaser, but the association receives a commission because of its work in holding for uniform prices and securing generally better marketing results.

Central California

Stanislaus County turkey shippers received around 35 cents.

Tulare County farmers will raise their greatest acreage of wheat this season.

Pear growers of California will hold an institute at Sacramento some time this month.

Turlock fruit growers are investigating a new process for drying fruits and vegetables.

State Horticultural Commissioner Hecke has been insistent on standardized orange pack.

Tulare County proposes to have a home demonstrator connected with the farm bureau work.

Oakdale people anticipate early improvement of state highway between Oakdale and Knight's Ferry.

There is a proposition on foot to enact a law doing away with the sweating of oranges until after December 1,

Miller & Lux Corporation is cancelling leases with tenants in Kern County, and it is anticipated that a large acreage will be sold.

The sealer of weights and measures is urging new legislation which will give him jurisdiction over quality as well as quantity of food products.

County Horticultural Commissioner Rutherford of Stanislaus County is planning a campaign of weed extermination along irrigation ditch banks.

Citrus people are preparing to protest freight charges which, with the three per cent war tax, is placing a heavy burden on the citrus industry.

L. A. Nares of Fresno has been elected president of the California Cattlemen's Association. David J. Stollery of San Francisco is secretary.

Aptos, Santa Cruz County, farm center is discussing winter killing of ground squirrels and gophers. A demonstration has been held, showing best methods.

Supervisors of Tulare County are considering a plan of flood control of the waters of Tule River. In time of flood these waters endanger lands about Porterville.

The annual convention of fig growers which was to have been held at Fresno, January 3 to 4 has been indefinitely postponed owing to the general prevalence of influenza.

The cattlemen of the fourth zone of the California Cattlemen's Association, in annual session at Hotel Fresno, elected J. W. Guiberson, president, and A. C. Cranor, zone manager.

Pomegranate growers near Porterville, Tulare Coounty, report exceedingly poor returns from pomegranates sent to the East. They say they give out these reports of returns because of many stories of long profits in pomegranate growing.

Report issued by the state horticultural commissioner is to the effect that Fred K. Howard, horticultural commissioner of Kings County, reports the only entirely squirrel free district in the extreme northeastern portion of Kings County.

Three hog sales conducted by the Stanislaus and Merced County farm bureaus at Tegner resulted in sale of 870 hogs of a total value of $28,430. Another sale was held on Monday of this week, and others scheduled are February 16 and March 16.

Southern California

San Dimas Lemon Association returned $740,000 to its members.

The tractor training school at El Centro has had a good attendance.

Imperial County's crop production in 1918 totaled $50,000,000 in value.

San Bernardino is preparing for its orange show to be held February 14-23.

Castor bean threshing will start in Imperial Valley in the middle of January.

Grazing fees within the national forests will be increased beginning March 1.

The cotton production of Palo Verde Valley reaches 7329 bales valued at $1,308,000.

Imperial County shipped out eight carloads of grapefruit the middle of December.

A tractor training school will open at Hemet, January 18, lasting through the month.

Riverside fair directors are already planning for next fall's Southern California fair.

Ventura County has secured a reduction in rates of electricity from ten to eight cents.

California is now producing 2000 tons of figs. The United States imports 8000 tons.

The shipment of navels from Southern California last year was only about 20 per cent of normal.

An irrigation district has been formed comprising 25,000 acres along the coast from Del Mar to Oceanside.

It is proposed to form a second drainage district near Oxnard, east of the new Patterson Ranch district.

J. C. Forkner, a large fig grower of Fresno County, is investigating fig prospects in the Coachella Valley.

The Arabia cotton gin at Indio is to be much enlarged for next season's work. Electric power will also be installed.

At the recent annual meeting of the Los Angeles farm bureau Volney H. Craig of San Fernando was elected president.

Orange County has a $1000 appropriation for its exhibit at the National Orange Show to be held at San Bernardino in February.

Six thousand acres have been signed up in the Brawley section for melon raising next year. This is all in the Japanese Farmers' Association.

Thirty thousand sacks of beans were destroyed by fire in the Southern Pacific Milling Company's ware house at Santa Susana. Most of the beans were Blackeyes.

Dairymen of Orange County are taking steps to form a cow testing association. It is possible that a two-county association may be formed with Los Angeles County.

The Placentia Orange Growers Association shipped during the past year 637 cars of oranges, of which only 15 per cent were navels and over 74 per cent were Valencias.

Owners of citrus groves have been sitting up nights with their orchard heaters. The extent of damage from the cold weather cannot be accurately estimated for some days.

Secretary Dudley of the Los Angeles chamber of commerce says there are more people here from the East this year than ever before who have come with the intention of settling.

The Coast and General

In all Japan there are less than 3000 sheep.

Colorado dairymen have determined that the silo doubles the dairying capacity of the land.

Wisconsin reports its holdings of potatoes as about the same quantity as last year same date.

Coconino County, Arizona, claims to be the first in Arizona counties in the production of seed potatoes.

The Florida strawberry crop is beginning to move. This year's crop is about two weeks earlier than normal.

A state conference of extension workers of the University of Arizona will be held at Tucson, January 20-23.

Yakima Valley, Washington, fruit shipments totaled last year $8,353,000. About $5,000,000 of this was for apples.

Southern Arizona farmers anticipate early construction of improved roads from Casa Grande toward Benson.

Farmers of Clatsop County, Washington, have saved four dollars per ton through cooperative purchasing of mill feeds.

Home grown lettuce supplying the New Orleans market is sold by the sugar barrel, usually commanding around five dollars.

Farm crops of America this year will exceed in value 12 billions of dollars; the value of wheat alone will be not far from $1,800,000,000.

The 22nd annual convention of the American National Live Stock Association will meet in Denver, January 21, for a three-day session.

Pacific Coast apples are receiving fine treatment in English markets. They have been selling around 19 shillings nine pence per box.

Coquille Valley, Oregon, is the banner sorghum molasses producing section of the Northwest. Some sorghum planters have realized as high as $200 per acre.

Arizona has most rigid quarantine forbidding importation of hay, straw, grain, alfalfa seed, nursery stock or vegetables from sections infested with alfalfa weevil.

California's state forester reports disastrous fires during the past year totaling 1546, which burned an area of 330,000 acres and destroyed timber, feeds, etc., to the extent of $1,593,000.

At the last annual meeting of the Tieton Water Users Association at Yakima it was recommended that the management of the affairs of the association be taken over by the members.

Marion County, Oregon, claims 7000 acres planted to prunes, 4500 acres of which are in full bearing. The largest prune orchard in the county is 212 acres; the average runs around 12 acres.

Colorado stock growers have lost many cattle from corn stalk disease. It seems to come from pasturing stock in corn fields where there is insufficient water for the stock, and impaction results.

California produces more peaches than any other state in the Union though Georgia exports a greater number of fresh peaches. Other peach producing states in order of importance are Washington, Ohio, Michigan, Colorado, West Virginia, New Jersey.

The Tractor's Place in Food Production

By Arthur L. Dahl

WHETHER we have peace or war in 1919 the demand for food will be the same. Long after our munition factories close and our big steel industries revert to their usual peaceful pursuits, he farmers will be called upon to ex- rt their greatest effort to grow maxi- num crops. So the growing season f 1919 promises to be a strenuous one or all sons of the soil.

Undoubtedly the tractor will be re- ied upon to a greater extent than ver before to supply power for doing he heavy work on the farm. In a neasure this reliance upon machinery will be forced upon farmers because of he increasing shortage of labor. It will be a long time after peace is de- clared before there will be a return of sufficient labor to take care of the farm demand, and in the meanwhile the tractor is the only substitute for man power. With a power machine a farmer can multiply many fold his own work or that of a hired man, and for this reason the tractor is a splen- did substitute for the missing men. Again, the prices received for all kinds of agricultural products raised during the past few years have been very good and the average farmer has prospered and has the means for buy- ing many of the labor saving imple- ments and machines he has needed for years. All tractor manufacturers re- port that the demand for their ma- chines is greater than production.

The day of the experimental trac- tor has gone, and it is now a recog- nized fact that where a farm is of suf- ficient extent to justify the purchase of a power machine the tractor is an absolute necessity. The testimony of the thousands of tractor owners throughout the country is so unani- mous in their favor that it must be recognized that today the tractor is a standard part of a large farm's equip- ment. In California the tractor is coming to occupy a prominent place in the equipment of the orchard or vineyard, and practically all of the California type of tractors are espe- cially adapted to orchard conditions. The tracklaying tread, the low height of the machine and the ability of the operator to turn sharp corners and plow close to trees or fences, all tend to increase the usefulness of these power machines for fruit culture, and some of the most ardent boosters of the tractor are fruit growers.

As in all young industries, those connected with the manufacture of tractors are alert to adjust their ma- chines to meet peculiar conditions in different localities, and accordingly we now find machines, and accom- panying equipment, built especially for plowing or cultivating between rows of vines, or between rows in an orchard. The same is true of special crops like beans or sugar beets or rice. Wherever a particular need oc- curs for a special kind of tread or new designs of plows or harrows or other implements, the tractor people have met those needs by special designs.

It is not often that we find a trac- tor actually supplanting horses, al- though it is a universal rule that the machine supplements the work of ani- mals. Occasionally, however, we hear of some one who relies entirely upon the tractor. R. E. Haslam of Gardena is such a man, and when he bought his 45 horsepower tractor he disposed of his 30 head of work stock. His faith in the power machine was justi- fied, for his tractor performed all of the work formerly done by horses, and at the end of the first season of its use Mr. Haslam's barley crop aver- aged 21 sacks to the acre as against 12 in former years. While some of this increase may have been due to climatic conditions, the owner believ- ed that the deeper plowing accom- plished with the tractor was largely responsible for the increased yield.

The presence of a tractor on a farm insures a strict compliance with the season's program of work. In Califor- nia, where sunshine is an assured fact during all of the ordinary growing sea- son, the elements are not such a gov- erning factor as in other parts of the country where the wet and dry sea- sons do not prevail. At the same time there are often periods when even the California farmer finds it impossible to get his work done on schedule time on account of adverse weather condi- tions. This is particularly true of heat, for animals are incapable of working for long, or with much en- ergy, when a broiling sun is beating down upon them. The mechanical, in- sensible machine is not affected by this heat, and it will go on working hour after hour under the most try- ing weather conditions. Furthermore it is more comfortable for the operator to sit on the tractor seat under an umbrella than to follow a team of sweating horses, kicking up a chok- ing dust to add to the effect of the heat.

Even where horses are numerous on a farm, a farmer who has not ade- quate help will find it difficult to get certain work done unless he has a tractor. It takes just as much time to drive a pair of horses, pulling a sin- gle plow or other implement, as it does to operate a machine possessing the power of many horses and capa- ble of pulling a battery of implements. The farmer who owns a tractor can accomplish as much work in a day as his neighbor who uses only horses and who has a half dozen men to help drive his animals. Where men are difficult to obtain a farmer is thus in- dependent of this labor, and he can do the work himself, aided by the members of his family. While it is true that the better the man put to operate a tractor the better the work accomplished, at the same time there are hundreds of instances where the young sons of farmers, and even their daughters, are successfully operating tractors, thus doing the work of able bodied men. At the tractor show at Davis last year one of the most suc- cessful demonstrators was a young University girl who handled her trac- tor as skillfully as any man and per- formed the most difficult kinds of work with her outfit. The same thing has been repeated in many other locali- ties, and many young women have learned to operate farm machines as successfully as they run their fathers' automobiles.

Besides being able to do practically all of the work done by horses, there are many ways in which tractors can be utilized around a farm which are beyond the scope of the horse. The tractor motor furnishes an ideal source of power for operating the thresher or the hay bailer or feed mill. The silos can be filled with silage cut by the tractor, or water can be pumped into the house tank or to the feed lot or for irrigation purposes.

There are many instances where the purchase of a tractor has resulted in increasing the quantity and quality of the crops raised by the owner. Often this increase has been so marked as to have more than paid for the outfit in a season. Many reasons are as- signed for this result. Sometimes it is a question of being able to do the plowing at the right season. In Washington state a wheat grower had always found it necessary to summer fallow his land each alternate season. When he bought a tractor he tried plowing up the ground to a maximum depth just as soon as the crop was off. The stubble was plowed under and the field left to the action of the winter's rains and the sun. In the spring the field was again plowed and sown to wheat, and a splendid crop produced. In this case the early plow- ing, coupled with the sweetening and revitalizing influence of the winter rains, prepared the soil for the next season's crops, without the loss of a whole year, as under former practice. With horses it would have been im- possible to do this early plowing be- cause the ground had been baked too hard by the constant summer sun. In previous years plowing always had to wait until the fall rains began.

Tractor plowing is more even, and usually deeper than that accomplished by horses. In many fields the tractor has enabled the farmer to plow sev- eral inches deeper than usual, thus turning up the subsoil and preparing the way for deeper root penetration of the plants. The moisture in the soil is further conserved by this deep plow- ing, and the growing plants are made more vigorous and fruitful.

Not long ago a representative of a tractor company, who traveled about a great deal, asked a number of trac- tor owners what they considered the most valuable thing about a tractor. Nearly all of them gave the same an- swer, and that was their ability to "push through" a certain kind of work when occasion demanded. They said that when only horses were available, they could work only so fast, and night work was impossible. With a tractor they could continue on indefi- nitely, through night or day, and the machine would supply just as much power at the end of the day's run as at the start. Horses tired out, re- quired frequent rests, and at the end of the day their pulling power dimin- ished. With tractor owners it is a common thing to operate their ma- chines continuously from early morn- ing until far into the night, often us- ing lights to continue the work. This ability to do overtime work is equiva- lent to a factory putting on night shifts to increase its production, and to the farmer the need is often as great and the returns as valuable as to the manufacturer.

The American farmer will undoubt- edly go "over the top" in 1919 as he did in 1918, unless nature decrees oth- erwise, and if, when he does, the sturdy, dependable American tractor will be found in the forefront of the fray, doing its bit to produce food for democracy.

Orchard Type of Tractor on Plow

The comparatively small tractor handles three disks in the open, also works close to trees.

"Cost Plus"

THE most consistent effort on the part of producers to ar- rive at production costs has been made by the citrus grower. His figures varied so much from those of his neighbor—or at least from those of his neighbor's neighbor—that he has felt hopeless in the effort to arrive at averages. The department of agriculture has found similar difficulties and its secretary recently expressed himself as almost hopeless as to ever arriving at definite conclusions.

We now note that in the National Stockman and Farmer its editor, E. S. Bayard, discusses the subject under the above title as follows:

At a recent state convention of farmers they favored the idea of fix- ing prices of farm products at cost plus a reasonable profit, the govern- ment to do the fixing. A little reflec- tion will show any one that such a plan is impossible of execution over an extended period. In the first place the cost of production of any staple product varies so widely in different parts of our country, and even on dif- ferent farms in the same region, that finding a price which will represent "cost plus" is practically impossible. But even if such a basis could be found it could not be maintained in the face of a surplus or made the market price in the presence of a shortage. Let us remember that prices cannot be fixed and maintained by governments—not even the prices of

Will Ship No Frozen Oranges

"HONEST oranges is the best policy" is the slogan of the California orange growers, at least the slogan of the great majority of them, though it is now reported that some growers will continue to ship notwithstanding the mass meetings of orange growers in Riverside, San Bernardino and Los Angeles Counties have resolved to hold back shipping for at least two weeks after the colder nights of the recent cold spell.

As indicating the temper of the orange growers here are the resolutions passed at the Los Angeles meeting which was called by County Horticultural Commissioner Ryan:

"Whereas, the shipment of oranges damaged by frost cannot but seriously affect the reputation of the California citrus industry, and

"Whereas, it is the interest to protect both the industry and the consumer, and

"Whereas, it is at the present time impossible to segregate the damaged fruit, and

"Whereas, it will be possible to make some such segregation in the small period of ten days, and

"Whereas, joint meetings of packers, shippers and growers with the horticultural commissioners of Riverside and San Bernardino Counties have passed resolutions recommending the discontinuance of packing until the damage can be ascertained, now, therefore,

"Be it resolved, that all picking of oranges be stopped at 5 o'clock, January 4, and not resumed before January 14, and

"Be it further resolved, that the horticultural commission be asked to put in force all its powers to enforce the stopping of shipments of citrus fruits damaged by frost."

These resolutions express practically the attitude of the other counties which have acted. The county horticultural commissioners have it in their power to control the shipping of injured fruit. The act which gives them this power is as follows:

"It shall be unlawful for any one to sell, offer for sale, ship or deliver for shipment any citrus fruits, which are immature or frozen to the extent of injuring the reputation of the citrus industry of the state of California if shipped, and for any one to receive any such citrus fruits under a contract of sale, or for the purpose of sale, or for shipment, or for delivery for shipment; provided, however, that nothing in this section shall be construed to prevent the sale or shipment for sale of frozen or otherwise defective fruit to a by-product factory, or the manufacture thereof into citrus by-products; nor shall this section apply to the sale, or contract for sale, of citrus fruits on the trees, nor shall it apply to common carriers or their agents who are not interested in such fruits and are merely receiving the same for transportation."

The weather has been colder than for several years and, coming almost on the anniversary of the coldest of all cold spells, January 6, 1913, it has caused much uneasiness and, unfortunately, intervening warmer years and higher prices of steel used in construction of the orchard heaters have prevented the orchardist from increasing his frost fighting efficiency. However, there was sufficient frost fighting carried on to require a total of 50 cars of oil per day to continue the campaign. During the coldest weather special oil trains were run by all railways from distributing centers to citrus sections, and this united effort has prevented much damage, even for those who have not joined in the campaign.

What the loss is it is impossible to tell, and that is exactly the reason why the growers are deferring until the middle of next week the shipping. The ground has been taken that where one knows that his fruit is uninjured he certainly will not ship because oranges will be under suspicion and presumably sell for a lower price during the next 30 to 60 days. Hence, fruit known to be uninjured will be held, and the shipping of frost damaged fruit which may give little indication of its quality this soon after the cold injury will result in a partially dried or at least a bitter fruit being thrown on the market. The invariable result of this has been to lessen the demand for oranges in all markets of the East.

If the injured fruit does not show the extent of injury by the 14th or 15th it is very possible that the citrus growers will make further extension of the time before shipping, for the orange grower is so determined to protect the market for his fruit that he will make strong appeal to the county horticultural commissioners to enforce the state fruit standardization law. The power of the commissioner is absolute, and the shipper who presumes to force frozen stuff on the market will be in danger of arrest and severe fine.

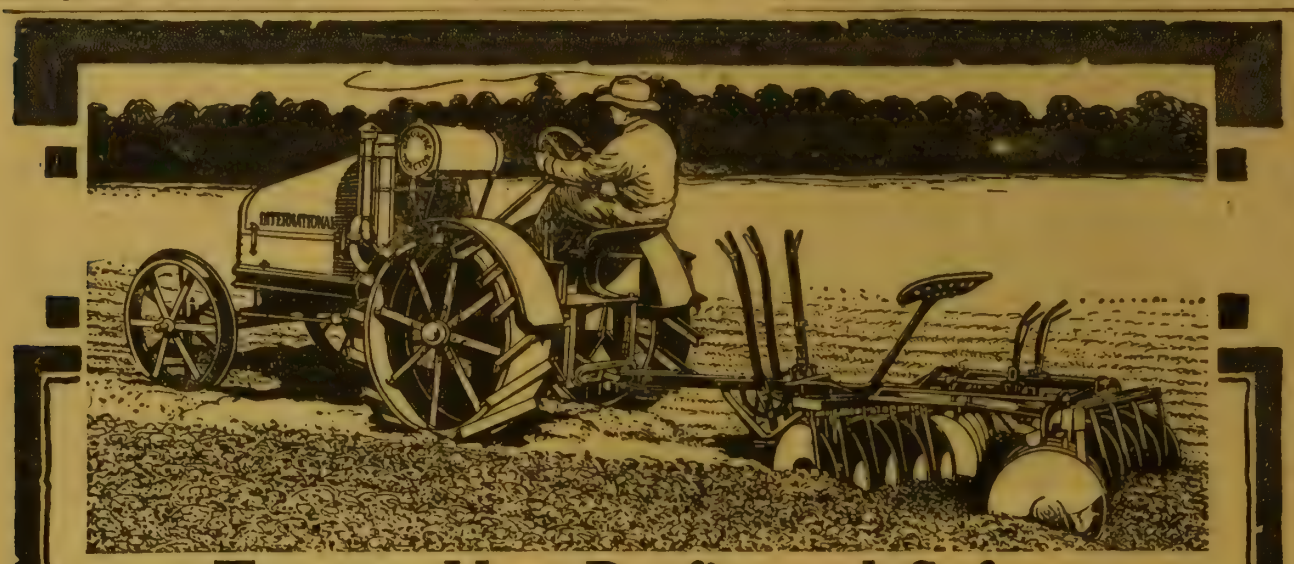
This effort on the part of the citrus grower will no doubt give a feeling of confidence in the citrus market, and when fruit is offered it will still command good prices. It will perhaps be 30 days before proper separation of frozen fruit from sound may be made in water separator, but by the 15th careful examination of the fruit will determine this matter, and this will be sufficient to enable the horticultural commissioner to act.

Wednesday morning's papers report:

"All oranges shipped from Southern California between January 1 and January 15, with the exception of those known to have been gathered and placed in packing houses before the damaging frosts of last week, will be subjected to the Pure Food and Drug Act tests and confiscation will result in the event that frosted oranges are discovered. This information was given out Tuesday when State Horticultural Commissioner Hecke ordered the county horticultural commissioners of Los Angeles, Riverside, Orange and San Bernardino Counties to keep a close check on all shipments of oranges going East before January 15.

The last sentence of the above is correct, but a phone message to Los Angeles County Commissioner Ryan develops the information that power of confiscation does not rest with the horticultural commission in such a case. But a strict watch will be kept, and where frosted oranges are detected the commissioners will enforce that section of the law given early in this article.

ELECTRICITY SAVES TIME AND MONEY ON THE RANCH



It requires from 7000 to 8000 hours of labor each year to keep the average farm of 140 a res up to its normal production each year.

If it is desired to speed up production on the farm this year, as all want to do, it is necessary to get more hours for labor on that farm or make each hour count for more than it ever did before.

Or if some of the usual help has been lost from the farm this year some way must be found to make the hours count for more than they did last year if the farm is to be kept up to anywhere near its usual state of production.

On many farms where these problems have arisen, electricity has been called to the rescue. Farmers are finding that by installing a small electric plant they can save a great deal of time and considerable labor and add a great many extra hours to their available time each week.

If the farmer uses electricity to run a water system, pumping water for the stock, for household use, sprinkling and the like, there will be a saving of something like two hours a day in the average home. Then calculate that there will be a saving of three hours or more each week where an electric motor is used to run the washing machine; as much more if there is a cream separator to be turned, or a churn; this same power will run the grindstone, fanning mill, horse clippers or sheep shears and it is easy to see where electricity will save from 1500 to 2000 hours a year on a farm where three or more workers are regularly employed. Electric power will run a one-sixth horsepower motor for two cents an hour for work like the above, which is considerably less than it will cost to do it by hand.

Tractor Use, Profit, and Safety

TRUE progress is always slow. The change to mechanical power for farm work has been twelve years in the making, but today there are few American farmers who have not given serious thought to the question of tractorizing their farms.

For the benefit of those who may not yet be convinced that the tractor is a useful, profitable farm power machine, we present again a few of the opinions of farmers who are using the International Kerosene Tractor. Some of these are about essential features, and some mention only conveniences, but taking them altogether, almost any farmer will feel, after reading them, that the International 8-16 is a tractor worth considering.

"My International supplies a power flexible enough to handle the large amount of seedbed, harvest and other work without delay."

"It can be used for continuous work if emergency demands it."

"It produces power at much lower cost than horses, and it can be used for both drawbar and belt work."

"I like the steady way it works. Without seeming to hurry, it gets through a surprising amount of hard work."

"It does a lot of good work at a cost so low I could hardly believe it. You did a wonderful thing for Eastern farmers when you made this tractor to run on kerosene."

"It is not bothered by flies, nor by bumble bees. It works steadily on the hottest days."

"Requires very little care. When the day's work is done, I run the tractor tail first into an inexpensive shed. In the morning, I fill the fuel tank and the oiler, look into the radiator, and am ready for another day's work."

These opinions are typical. They prove at least that the International 8-16 is a useful, profitable tractor. Now consider just one other thought for a minute.

This tractor is the outgrowth of twelve years of active tractor experience by a company that has sold all kinds of farm machines for many years. The beginning of this business goes back to 1831—almost 88 years ago. Does it not seem reasonable that with this experience we should offer you a tractor that you could use with profit, especially when we expect to come back some day and sell you more of the machines listed in this advertisement?

If you are now convinced that the International 8-16 is a useful, profitable tractor on some farms, and that you don't have to be an expert to buy one safely, write us to find out what this tractor will do for you, on your farm. A post card will bring you full information.

ANNOUNCEMENT

WE are resuming quantity production on Goodyear Passenger Car Tires for private use.

The shortage of these tires that existed during the period of war was inevitable.

Promptly upon America's entry into the war, Goodyear devoted great effort to the production of gas masks, airplane, automobile and truck tires, balloons and dirigibles, urgently needed by our army and navy.

This, of course, necessitated a cut in our passenger car tire output, for general distribution.

Later, there came the Government order limiting all tire makers to 50 per cent of their normal output.

This restriction has since been lifted.

So, as normal conditions are being restored, we are increasing our production steadily in an effort to meet the greatly increased demand for Goodyear Tires.

However, to insure prompt delivery, we suggest that you estimate your near-future requirements, placing your order now with your Goodyear Service Station Dealer.

DISC PLOWS

The same accurate knowledge of Pacific Coast farming conditions, the same careful and simple designing, the same high quality of material and workmanship, the same high standards of strength and sturdy construction that have made the "Caterpillar" Tractor supreme in the farm-power field, have gone into the building of "Caterpillar" Disc Plows.

"Caterpillar" Plows are not a new product—we have been building them for years. They were produced primarily for use with the "Caterpillar" Tractor, so they had to BE good and MAKE good—we couldn't afford to endanger the enviable "Caterpillar" reputation by offering a plow that wouldn't prove equal to the severest tests of strength and service.

With any make of tractor, we know that they will help the farmer do a better job of plowing and enable him to get more out of his tractor by increasing the tractor's capacity for work and eliminating delays due to plow troubles.

Get the "Caterpillar" Disc Plow catalog and learn of the many exclusive features not found on any other plow!

Easy Ditching

THE "good old days" of a pick and shovel have become memories. Instead of spending a week on a mile of ditch, Mr. Farmer now completes the job in a few hours. He does a better job, too—and saves a BIG LOT of *valuable* time. He does it with THE Martin

GUARANTEED

DITCHER, Grader and Terracer

Makes new ditches; cleans old ones; grades roads; builds dykes and terraces. Cuts alfalfa, Bermuda grass or sweet clover roots from ditch banks, without plowing. Does more work and better work than 100 men with old methods.

Made In Horse and Tractor Sizes

All steel. Reversible. Adjustable. No wheels, cogs or levers. More MARTINS now in actual use than all other farm ditchers combined. Warehouses and distributing points in nearly all Western States. Write for free descriptive catalog and nearest distributing point, together with list of MARTIN users near you.

Some Modern Methods of Pruning

Written for California Cultivator By J. W. Mills

THERE is a tendency in parts of California to prune deciduous trees more lightly than has been the general custom, especially in young orchards. This is the case in Placer County, and demonstrations at the University Farm at Davis tend to show that light pruning during the early life of peaches, plums and apricots makes a larger tree at the end of four years, and a paying crop is produced one year earlier than when the trees are pruned heavily up to four years of age. It remains to be seen how these trees behave when they reach mature age. In my own experience apricot trees that have been pruned but once since they were three years old are the heaviest producers I have, and the fruit is as large as that on trees pruned every year. They, however, have alternately a heavy and a light crop, and some seasons no crop at all. The trees were planted in 1891 and were never irrigated. They are on a sandy loam 16 feet deep.

On the same land peach trees treated in the same way were a total failure. They made a wonderful growth and had an abundance of worthless fruit.

Substitute for Cultivation

Many of the mature prune orchards of the lower Sacramento Valley have during the last few years, and perhaps longer, fallen off in bearing to an alarming extent. Theoretically nature has been abused to such an extent that the trees rebel.

It is our opinion that could the land be allowed to lie undisturbed and at the same time retain sufficient moisture for the needs of the trees a wonderful increase in the crop would be the result.

The roots of trees begin to grow long before there is evidence of sap movement in the tops. The feeders are reaching into the warm, rich surface soil and taking in the elements that go to make twigs, leaves, blossoms and fruit. About that time we all got busy with our plows, cultivators and weed cutters and keep the feeding roots diligently shorn off until most of the fruit is on the ground or it has lost its grip on the trees.

Granting all this is true, how are we going to carry our trees through without cultivation where an abundance of water is not to be had? It can not be done. On the other hand, where is the orchardist who has plentwo of water and does not cultivate? We know of one fruit grower in Tehama County who never plows or cultivates, but grows alfalfa over the entire area of his orchard, fertilizes and irrigates. Though the stubble interferes somewhat with picking up prunes, the fruit is so large and abundant that the prune pickers prefer to work there rather than in other orchards.

We have an old plum orchard on our own ranch that is plowed about once in four or five years. The seasons following plowing always bring light crops of fruit in this orchard while heavy crops follow heavy crops every year during the periods in which the orchard is not plowed. Some of the growers in Placer County have adopted the plan of allowing the weeds to grow throughout the year and irrigating when necessary. As a result the soil takes in the irrigation water better; the trees are more thrifty and heavier crops are harvested.

A number of years ago we were carrying on experiments in the original Washington Navel orchard in Riverside. The soil in this orchard was so compact from plowing, cultivation and irrigation that it was impossible to make the water penetrate to a depth below where the plow ran. During one winter and spring the rains were so constant that water stood on the surface for weeks at a time, and the earthworms propagated so that there were millions of them in the orchard. The ground looked like a pepper box after the rainy season was over and the worms had followed the moisture down. When the irrigation was resumed the following summer it took the water two days to reach the lower ends of the furrows where formerly it took no more than two hours. The worms had perforated the soil so that the water sank deeply into the soil. The trees took new life, while formerly large quantities of fertilizers had no effect.

Now why not cultivate worms in the orchard wherever it is practical? One of the largest orange growers in Riverside is reported to be making permanent basins and filling them with straw and is obtaining good results. It costs this man hay prices to obtain the straw. Here in the big valleys of California thousands of tons of straw are being burned, almost adjoining orchards that have been and are getting in bad condition. It is our opinion that if some of these orchards were basined, filled with straw and flooded when necessary, that more and better fruit would be grown and the lives of the trees prolonged. It might be advisable to alternately plow and basin every other space each year as protection against fire.

Loganberries

THE department of agriculture has made investigations as to the Pacific Coast loganberry or, as it prefers to call it, the Logan blackberry. This berry, it says, was formerly thought to be a hybrid between the blackberry and the red raspberry but is now considered a variety of the Pacific Coast species of the trailing blackberry.

The department anticipates a great future for this berry in California, Oregon and Washington in the production of fruit juice beverages and in the making of jams and jellies.

The Logan blackberry is adapted to the milder parts of California, Oregon and Washington, where the temperature does not reach zero. While the plant may survive in some sections of the South, it does not fruit well, and it is not hardy in the Northern states. The fruit resembles a large blackberry in shape but has the color of the red raspberry. Logan blackberries and related varieties thrive on any deep, fertile, well drained soil, but the crops will be largest on the richest soils. As with other berries and garden crops, it will pay well to have the soil in good condition before the plants are set. In Oregon and Washington plants should be set in early spring not later than the middle of April while farther south in Califor-

nia they should be set as soon as the young plants have grown enough to transplant, usually in January. Plants which have formed during the autumn and winter at the end of the year-old canes are generally used to start a new plantation.

Owing to the trailing habits of the Logan blackberry, it is necessary that trellises be made to support the canes. Posts are usually set about 30 feet apart in the rows along which two or three wires are strung, the top wire being from four and a half to five feet from the ground. The canes usually grow from 15 to 20 feet, although they may reach 30 feet in length in a single season. Trellising should be done in the autum of the first year or in the early spring of the following year. Two systems—the weaving and the rope,—are in common use. In the weaving system each cane is woven separately on the wires and thus the largest possible fruiting surface is exposed to the sunlight. When the rope system is adapted all the canes are wrapped about the trellis wires in bundle fashion. Immediately after the harvesting season, when the plantation is in its second year, the canes that have fruited should be cut out and new canes trained to the trellis. With this exception very little pruning is necessary.

The Logan blackberry begins to ripen a little later than the first raspberries and usually continues for about six weeks. When destined for the fresh fruit market the berries must be picked several days earlier than when they are to be canned, evaporated or used for jellies and preserves, or for extracting the juice. When efficient methods are used the berries may be shipped long distances. If the berries are to be evaporated they should not be picked until very ripe. If they are to be canned they should be picked while still firm, but after they are thoroughly ripe, while, if they are intended for unfermented juice purposes they should be allowed to ripen in the canes more than is ordinarily allowed when intended for the evaporator or the cannery. Between one and two tons of fruit per acre can be expected from one year old plantations, but when plants are well established yields should range from four to five tons per acre. Some plantations in Oregon have been known to remain nearly 20 years and still continue to bear excellent crops, but in California they do not usually continue to be profitable longer than six or seven years.

SMYRNA FIG CULTURE

"Smyrna Fig Culture," Bulletin 732 of the United States department of agriculture, by G. P. Rixford, Physiologist, Crop Physiology and Breeding Investigations, and located in California, is issued under date of November. It gives a bit of history of the Smyrna fig industry, the origin of fig culture, classification of cultivated figs, crops, caprifig, and general discussion of fig flowers and fig seeds, and of course the practical side of harvesting, curing, picking, shipping and general culture. Regarding the opportunities in this industry Mr. Rixford says:

"At the present time the annual production of dried figs in California amounts to about 6000 tons, one-third of which are of the Smyrna type and the remainder chiefly Adriatic and Mission, the Adriatic including by far the largest quantity. The reason for this is that the Adriatic was extensively planted many years before the Smyrna was introduced. In a few instances Adriatic figs are still being planted under the mistaken idea that they are more prolific bearers than the Smyrna variety. One prominent grower in the San Joaquin Valley who has orchards of both Smyrna and Adriatic finds that by a liberal supply of caprifigs he gets a ton to the acre more from the Smyrna than from the Adriatic variety, while the former sells for about double the price of the latter. At the present time he is engaged in grafting his Adriatic trees to the Smyrna variety. The fig plantings at present are confined almost entirely to the Smyrna type and it is only a question of a few years before the markets of this country will be supplied with home-grown Smyrna figs.

"The cutting off of the supplies of figs from Asia Minor and the countries of southern Europe by the war has so raised the prices as greatly to stimulate the planting of figs in this country. It is a reasonable estimate that 10,000 acres of Smyrna fig trees have been planted in the central San Joquin Valley alone during the last two years. When these large plantings come into bearing, this country will be independent of importations from Smyrna, and dried figs by the carload will be as evident in commercial movements as raisins are at the present time."

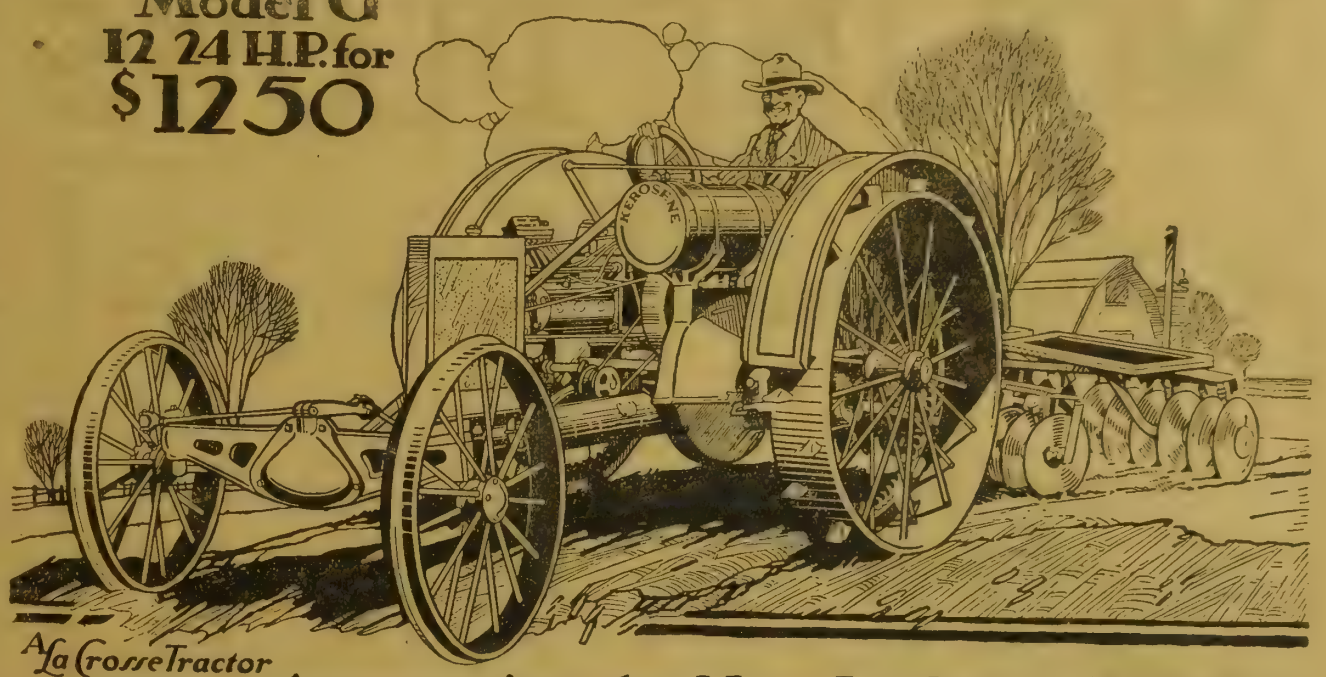
ANNUAL MARKET REVIEW

The California Fruit News issues its usual end of the year review of California fruit conditions and markets. It is very complete in its tabular statistics of the past year and of other years since 1900. Typographically it is a beauty.

SHORT RATIONS IN ITALY

To Italy, peace brought only increased food difficulties as the newly acquired territory and prisoners added about 5,000,000 people who must be fed. With admirable foresight the government set aside a great store of food for the immediate relief of the redeemed provinces and returning prisoners, and prepared to face the situation.

Rationing is vigorously enforced by the card system and war time allotments of food have been severely cut. The new ration provides a monthly allowance of 17 pounds of bread and 13 pounds of other food for each person. This is only a pound of food a day and seems very little at any time but especially meager in this hour of victory.



France is now producing about one gallon of milk where two and one-half were produced before the war. Available milk in Paris has lately been selling for 32 cents per quart, but its use is limited principally to young children and the sick.

According to the British board of agriculture the number of hogs in Germany now numbers about 5,000,000 as compared with 27,000,000 before the war.

As a food control measure in Norway to properly distribute the available fat supply, producers are prohibited from selling butter direct to consumers.

Fish sausage is being manufactured in Sweden. Early in September its retail price in Helsingfors ranged from 55 to 63 cents per pound.

A La Crosse Tractor means a Happy Farmer

Announcing the New La Crosse Tractor

HERE is the new four-wheeled La Crosse Tractor, the triumph of the master engineers of the great La Crosse organization. Commencing with the first of January, 1919, we are bringing out this new model and are giving it a name of its own "The La Crosse Tractor".

The La Crosse Tractor is based upon the proven engineering principles which have been so successful in the La Crosse Happy Farmer Tractor, combined with standard four wheel construction of the most practical type.

Wherever you see the bright orange of the La Crosse Tractor there you may expect to find a Happy Farmer. The La Crosse Tractor means a Happy Farmer, for it is the tractor which in all soils and climates, on flat or hilly ground, in day time or night time, does the work you want it to do quickly, economically and efficiently.

Three Plows—12-24 Horsepower

The La Crosse is the standard three plow tractor. With its 12-24 horsepower it is the tractor of just the right size. It is large enough to do any power farming job on the average farm, while it is small enough to be economical on fuel and light in weight. You can handle it, together with the La Crosse Tractor Implements, single-handed.

The La Crosse is the simple tractor. It burns kerosene perfectly, and is equally efficient on either belt or drawbar.

It is the policy of the La Crosse Tractor Company never to be satisfied with anything but the best, and to keep perfecting the La Crosse Tractor so that it shall always be the leader of the field. The La Crosse Tractor as it is placed on the market today contains every feature which has made the Happy Farmer famous, with new improvements which make it the up-to-the-minute tractor you are proud to own.

La Crosse Tractor Implements

The new La Crosse Tractor and the special La Crosse Tractor Implements make the perfect team for efficient work. These implements are made according to the same standard as the La Crosse Tractor and offer you maximum convenience and strength. La Crosse Tractor Plows, the Special La Crosse Tractor Disk Harrow and the La Crosse Power-Lift and Power-Pressure Grain Drill can all be handled entirely from the driver's seat on the tractor.

See Your Dealer Now

Write us today for the name of your La Crosse Tractor dealer. Tractor prices are constantly advancing. The demand is much greater than the supply. Compare this price of practically $100 a draw-bar horsepower with the price of any other tractor on the market. The La Crosse Tractor will actually develop more than 12 horsepower at the drawbar. Yet it sells today for $1250, and is rated at 12-24 horsepower. This price is subject to change without notice. Write us today.

Model G, 4-wheel La Crosse Tractor $1250
Model F, 3-wheel La Crosse Tractor $1150

Orange Marmalade and Orange Jelly Stock From Frosted Oranges

By W. V. Cruess

THE past few days of freezing weather have added greatly to the quantity of cull oranges for this season. The disposition of these oranges at a profit presents a very serious problem. The University of California has, during the past five years, conducted experiments along many different lines with a view of developing a by-product from oranges which would have a large market and which would not be too expensive to produce and which could be sold at a low enough price to stimulate the buying of the product. Orange juice was discarded because it seemed to be impossible to retain the fresh orange flavor. Citric acid can not be made profitably because oranges are too low in this constituent. Orange oil from cull fruit does not offer a solution of the problem. Orange marmalade and orange jelly can be made from cull fruit, but their manufacture requires very large quantities of sugar and the products must be sold at a high price. Because of this fact the manufacture of orange jelly and orange marmalade requires a large capital and the consumption of the product is restricted because of its high retail value. Our experiments have definitely shown, however, that it is perfectly practicable to put up the orange juice or the orange juice and sliced peel in cans ready for the use of the housewife for jelly making or marmalade making purposes. This product is put up in the unsweetened state. The fruit can be handled automatically in the canneries. It could be produced in enormous quantities. This product could be put up in cans of the ordinary Number 2½ size, that is, quart size, for the use of the housewife, or in gallon or five gallon cans for the use of the marmalade factories or bakers. The housewife, marmalade manufacturers and bakers then buy this canned material, add the required quantity of sugar and make marmalade. This method relieves the manufacturer of the cost of sugar. It permits the production of a marmalade of fresh and pleasing flavor. Marmalade which has been made for several months is not equal in flavor to that made from freshly canned stock.

Balling Saccharometer and Metal Cylinder

For determining the Balling degree of the jelly or marmalade juice. The juice obtained from boiling and straining the pulp should test at least eight degrees Balling when cooled to room temperature.

Processes of Manufacture

The stock for canning is made from a mixture of oranges and lemons. To each box of oranges is added about one-quarter of a box of lemons. The fruit should be sorted and washed. The next operation is that of slicing. Marmalade slicers are sold by practically all dealers in commercial canning machinery. The fruit should be sliced thin, not more than one-sixteenth of an inch in thickness. To each 100 pounds of the sliced material is added about 200 pounds, or about 20 gallons, of water. The pulp and water are boiled until the pulp is soft. From one-half to three-quarters of an hour would usually be sufficient. Ordinary jelly kettles can be used for this purpose, or it is also feasible to use large vats that could be heated with steam. The fruit is then strained

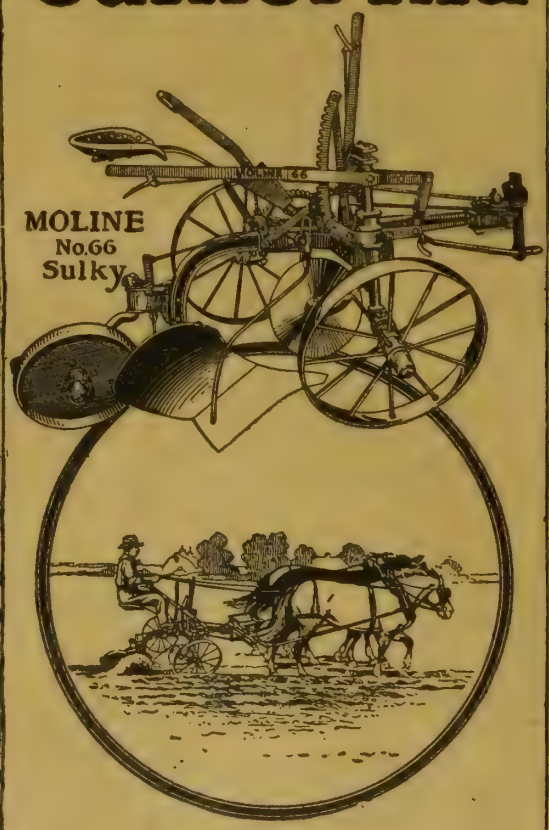
MOLINE PLOWS

For California

WE HAVE been building plows for California for many years. We know that California conditions are so unusual that special plows are required. No matter what your needs, or conditions, there is a Moline Plow for you.

The Moline No. 66 Sulky Plow is built especially to supply the demand for a plow that is capable of standing the hardest usage, and of plowing deeper than the usual type of sulky plow. You can plow 11 inches deep with it and no matter how hard your soil or how many horses you use on it, the Moline No. 66 will stand up and continue to do good work.

* * *



For tractor disc plowing the Moline Power Lift Disc Plow will give the most satisfactory service you ever received. It penetrates easily the hardest soil. It also has the strength to resist the terrific strain to which it is subjected; a positive power lift which eliminates all the hard work of raising or lowering the plow and adjusting for depth; an efficient means for adjusting width of cut; a hitch guide; automatic control of rear furrow wheel to hold the plow to its work; and many other features which add to the quality of the work and convenience of operation.

The Democrat-News of Lewiston, Mont., contains the following account of a demonstration of the Moline Power Lift Disc Plow in the Judith Basin Country, where some of the most difficult plowing in the world is encountered:

"The gentlemen gave a most wonderful and successful demonstration on Tuesday (Dec. 11, 1917) of this new plow, and one which we do not think had ever been equaled before in history. They were plowing in a field south of the city on Mr. Otten's ranch in ground covered with a foot of snow and five inches of frost. The plow turned this ground over with ease seven inches deep and it can handle any depth required."

* * *

See your Moline dealer or write and tell us your needs. We will be pleased to send you information on the Moline Plow best suited for you, either for field or orchard, horse or tractor use, disc or moldboard (steel or chilled bottom). Address Dept. 49.

MANUFACTURERS OF QUALITY FARM IMPLEMENTS SINCE 1865

through ordinary jelly bags to separate the juice from the pulp. If marmalade stock is to be produced, a quantity of the sliced fruit should be boiled with water as directed above until tender, but not until the fruit is broken up. The juice is then drained off and the pulp is washed under a spray of water to remove the flesh and broken cells from the rinds. The flesh will give a cloudy appearance to the marmalade and should be removed in this way. The washed peels are then combined with the strained juice. This is most conveniently done by adding the washed peels to the cans in which the material is to be placed at the rate of seven ounces of the sliced peels to each one quart can. The juice is then heated to boiling, and filled into the cans, sealed, and sterilized for 25 minutes in boiling water in the same manner in which ordinary fruit is sterilized in cans. The cans are then cooled in water in the usual way. The product is then ready for labeling and marketing.

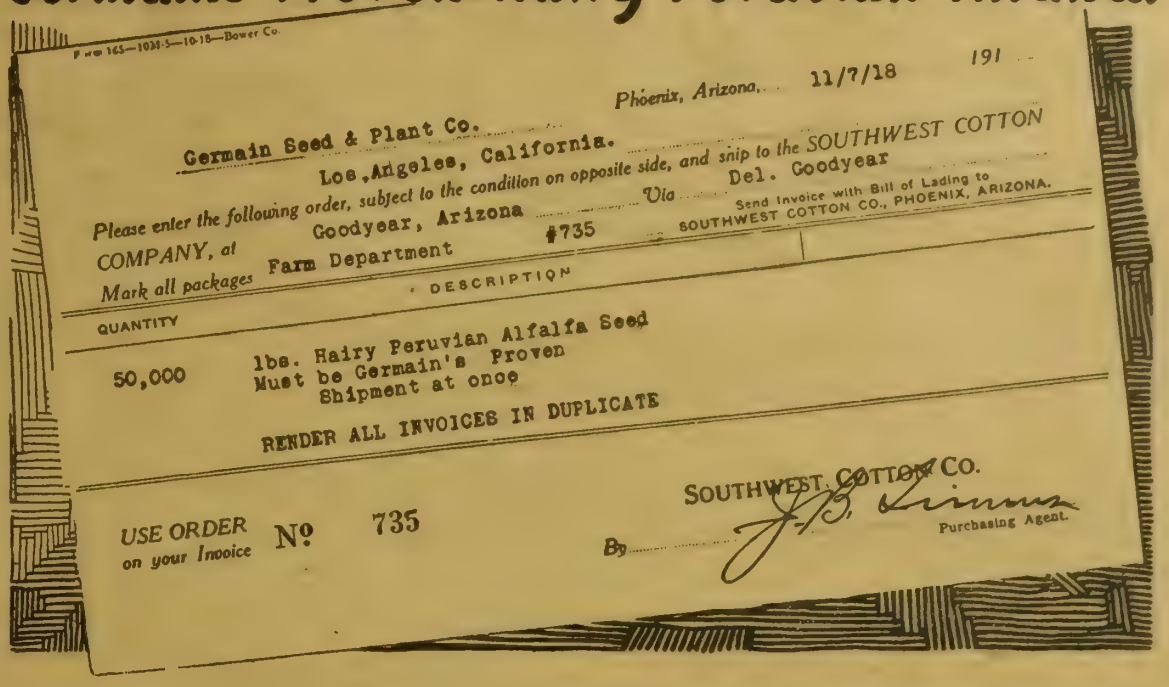
The juice should be tested in several ways to be sure that it will make a good marmalade. This can be done by taking a small quantity of the juice, mixing it with the required amount of washed sliced peels, and cooking down to a marmalade with an equal quantity of sugar. A simpler test is that of analysis for Balling degree and acidity. This analysis is made in exactly the same way as the determination of the Balling acid ratio of oranges to meet the government test. The strained juice should be cooled to about room temperature, placed in a cylinder, and a Balling saccharometer inserted and read. The Balling test should test at least 8 degrees Balling, if one is to be certain that the juice will make a good marmalade or jelly. This test is made on the juice which is obtained by boiling the strained pulp of the fresh juice. The acidity should be at least six-tenths of a per cent when judged by the usual titration method. This test is well known to all orange packers and need not be repeated here. The test for pectin is also desirable. This is easily made by placing one teaspoonful of the strained juice and one teaspoonful of 95 per cent alcohol in a glass. If the juice contains sufficient pectin to make a good jelly or marmalade the mixture of lemon juice will set to a soft jelly in a few seconds.

The canned material can be marketed as "orange juice and peel for marmalade" with full directions for making the material into marmalade in the household. These directions will be somewhat as follows:

"Orange Marmalade for Use of Canned Juice"

"To each can of this marmalade juice and kin add an equal volume of sugar or three-fourths its volume of corn or other syrup. If a very stiff marmalade is desired use only three-fourths the amount of sugar given above. If a very soft marmalade is desired use more sugar. Bring to the boiling point and boil until the material will hang in sheets from a cooking spoon or, if a thermometer is available, boil until the thermometer will register, when inserted in the boiling liquid, 220 degrees F. Pour into glasses, allow to stand over night, and serve as a breakfast dish. You will find this marmalade very much fresher in flavor than that which you buy in the stores."

Orange Jelly Juice



In making the orange jelly juice, proceed exactly as described for the orange marmalade stock, except that the sliced peels are not added to the cans. The juice in this case should be strained two or three times to get it as clear as possible in order that it will make a sparkling clear jelly. It is then filled boiling hot into cans; sealed and sterilized. The directions for making this stock into the jelly in the kitchen will be exactly as described above for marmalade.

Yield and Possible Returns

From tests made in the laboratory it has been found that the yield will vary from 600 quarts of marmalade stock to 1000 quarts of marmalade stock per ton of oranges and lemons, the lemons being mixed in the proportion of 12 pounds of lemons to 50 pounds of oranges. If the material is put up in quart cans, the cans will cost the manufacturer about four cents apiece. If the fruit is obtained

The Popular Persimmon

Written for California Cultivator By Ernest Braunton

TRAVELERS through rural districts at present are greeted nearly everywhere by fruit laden persimmon trees. A majority of these are in the dooryards, for few planters have regarded them as a source of revenue, and therefore orchards of persimmons are scarce. Some time ago I was talking with an orchard owner who possessed ten acres of oranges. On the lower end of the plat, next to a waterway, there was a narrow sandy strip. On this the owner planted about a score of persimmons in three varieties. The trees are now ten years old. The owner stated that if he were to plant today he would put in persimmons over the whole ten acres as he had made more money per tree from the persimmons than he had from the oranges.

One citrus grower to whom I related this statement said: "It is strange persimmons have become profitable, for you can't do anything with them except to eat them as fresh fruit; you can't use them in cooking." He was forced to laugh when I called his attention to the fact that the same is true of oranges. Marmalade, orangeade, candied peelings, etc., do consume a few oranges and but a few compared with the total crop. The most serious drawback to growing persimmons for profit is that they will keep but a short time and do not bear transportation well. But if we waive their serious recognition as an orchard crop, let us plant them in the garden. Persimmons have a decided ornamental value, for what deciduous tree can compare with them when in fruit? The fruit is most delicious when fully ripe and anyone that likes candy will relish a good persimmon in good condition. A half ripe persimmon is less palatable than a green orange. The leading varieties are Hichaya, Hyakume and Tana Nashi, of which the former is the largest and, in my opinion, is equal in flavor to any.

Mixed Highway Planting

Last week, while out in the Puente-Covina section, I passed over a highway aligned with three species of acacia. They were Acacia Baileyana, dealbata, and decurrens. Though well grown and in thrifty condition, the effect was far from pleasing. The blue of the A. Baileyana does not at all harmonize with the yellowish green of A. decurrens. It is a serious mistake to mix trees in street planting. Strong effects are never produced by mixtures of plants of any kind, or for any purpose, or in any place whatsoever.

Roadside Adornment

On a highway twenty miles east of Los Angeles there is a half mile of strong fence (material not in evidence) covered with a heavy growth of climbing roses. It is one of the most pleasing and effective roadside adornments that I have seen. The best effects on the county's roadside hurdles of fugitive farm gates cannot compare with it. We can even forgive the owner for making the fence too high. Such hedges should not be so high but passersby in automobiles may not see the enclosed orchard. But, setting aside the height, the general effect is one of the most attractive I have seen.

For Quick Effect

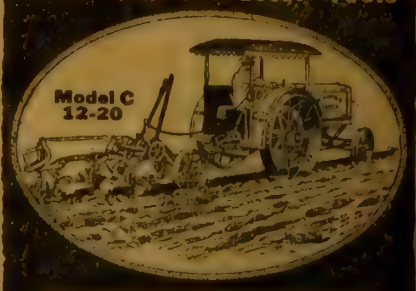
Last week I saw some street planting adjoining a small city that was not an unmixed blessing, yet good to behold. It was composed of alternate trees of Monterey pine and live oak, planted about 30 feet apart. While I should prefer the oaks alone, the planter evidently wanted quick scenic effect or a windbreak for his orchard. The trees had grown nearly together and in a few years the pines will have to be removed. In the meantime they may be pruned on the sides to allow the oaks to expand without interference. On the whole this plan is to be commended, for it is quite evident, from distances apart, that one-half the trees are to be cut away.

Nursery Junk Scarce

Plant growers, both of ornamental and evergreen fruit trees, are complaining of a decided scarcity of tin cans and sacking. In some cases the digging of plants from the fields has been stopped because such necessary material could not be obtained at prices that would allow removal of stock. Plant dealers cannot pay present prices for gunny sacks or five-gallon oil cans and other material must be substituted. For smaller sizes paper pots may be used, but even the prices of these have soared of late and it would seem that for the nurseryman there is no balm in Gilead.

California Big Trees

There are 31 groves of big trees, or Sequoia gigantea, in California, and the number of real big trees or forest giants is 86,500. The smallest grove is known as North Grove, on the Middle Fork of the American River in Placer County, and contains but six trees. The one known as the Giant Forest contains 20,000 trees and is on the Marble Fork of the Kaweah River in Tulare County, and covers 9000 acres. The elevation of these groves above the sea ranges from 4300 feet in the first small lot of six to 8000 feet at the highest part of the Giant Forest. The most southerly lot is in the Greenhorn Mountains on the South Fork of Deer Creek in Tulare County, but close to the northern boundary of Kern County. It contains 150 trees on 300 acres.



Trees in California

There is hardly a clear distinction between trees and shrubs, but those having a single trunk and more than 20 feet high may be regarded as trees. Of such California has 92 species, of which 57 are found in Southern California, a most remarkable number for a semi-arid climate. There are but two species common to California and the Eastern states. These are the aspen and the black willow, found everywhere, even reaching to the Arctic regions. California forests are formed almost exclusively of conifers or cone-bearing trees. We have the comparatively large number of 50 species that are typically Californian or almost wholly within this state, and here reaching their highest development.

Cliff Dwellers

In New Zealand, on the steep cliffs or sea walls there grows a vine that covers heavily and grows where no soil is in evidence. A resident botanist writes that a little dust from the weathering rock, falling into a slight depression, is sufficient soil for this hardy vine to get a foothold. As this vine is and has been common in California for years it is a wonder it has

SURFACE IRRIGATION

not been used for cliff or rock wall cover. It is locally known as the wire vine. Its botanical name is Muehlenbeckia complexa.

Sand Binders

Glorious Golden Gate Park of San Francisco was once a windswept stretch of shifting sand dunes on which nothing grew. The first real work of fastening the drifting sand was by means of Sea Bent Grass, Calamagrostis or Ammophila arenaria. This was introduced from Europe but has now become naturalized at several places along the coast. It has not been used as much as it should be for we have thousands of acres of coast sands which should first be stayed by this grass and then plants, trees and shrubs planted. In this way parks and gardens may be carried right down to high tide levels. This grass was introduced to San Francisco in 1876 by Louis McLane and Prof. Geo. Davidson.

Petrified Forests

We have no thought of advocating the planting of petrified trees in the garden but wish to record a matter of age. Geologists estimate the age of the petrified trees in Arizona at approximately fifty million years. They grew in the mesozoic age and were lowered into the ocean or the ocean rose over the land. After ages of time the land was thrust up or the waters receded and left these forests high and dry. I have some of this "once was" wood but have finer specimens dug from Elysian Park, Los Angeles, of cypress just as it exists in Northern California and Oregon at the present time.

"COST PLUS"

Continued from Page 37

their own bonds. Prices of commodities may be limited for comparatively brief periods under stress of war, but even that is difficult and always brings with it the penalty of withdrawal of commodities from market if the limit is too low. There is no way to maintain a price in the face of a surplus except by taxing somebody to pay the difference between the market value and the fixed price, and this too is impossible except in a great emergency for which the public is willing to be taxed. Our national wheat program may furnish an example of this economic truth before June 1, 1920, if the fall crop promise is maintained. It is probable that the government will have to resort to taxation to pay the wheat grower what it has agreed to pay him for the crop of 1919. But since this agreement was made to avoid famine there will be no serious objection to paying taxes if that becomes necessary. The present hog market is another example of the difficulty of maintaining prices, even with the buying for a whole hungry continent concentrated and controlled as it could not be under other conditions. There is another thing which we are prone to forget, namely, that the interest of consumers in prices is equal to that of producers, and they would not tolerate any measure which gave producers the best of the deal or which they thought had such an effect.

There is another class of advocates of price fixing just now who believe that guaranties to farmers should be extended in order to stimulate production which they think will be needed. These men do not believe in government interference in such matters except under extraordinary conditions, but they fear a food shortage unless something is done to induce still greater production. We cannot agree with these gentlemen either. Overstimulation of food production is a danger less serious than neglect of it, but we see no reason to fear neglect. The world may now safely rely for its food on the normal stimulus of good prices, the interest of all classes in food production and the great awakening to the importance of agriculture which has come from danger of famine. The farther production is forced beyond the bounds fixed by such normal influences the greater the reaction will be when it comes. The longer the list of violations of sound economic law the longer the list of penalties of one kind or another, for such penalties are always exacted. These are some of the reasons why we oppose further price fixing or guaranties, which may look attractive for a season but will prove to be disadvantageous to all concerned in the end.

HIS BEST COMPLIMENT

"Well, Kate," said the parson, according to the Cleveland Plain Dealer, "did you like my sermon this morning?"

"'Twas a grand sermon intirely, sorr," said Kate, dropping a courtesy.

"And what part did you like best?" asked the pastor, who was a bit waggish.

"I don't remimber, yer riverence, but ut war all good."

"Now, Kate, if you can't remember it, how do you know it was good?"

"I'll tell yez. See them clothes on the line?"

"Yes, Kate. And a fine lot of work you have, this morning."

"Isn't ahl that suff betther f'r the washin'?"

"Of course it is."

"Aha! An' yet not a bit av th' soap sticks to it. That's the way it is, sorr. My soul is betther an' cleaner f'r y'r sermon, though not a word o' what ye said stays by me."

And that, the minister told us, was the best compliment he ever got.

To be happy at home is the ultimate result of all ambition; the end to which every enterprise and labor tends, and of which every desire prompts the prosecution.—Johnson.

Nor need we power or splendor,
Wide hall or lordly dome;
The good, the true, the tender,
These form the wealth of home.

30 Years' Experience
Building Disc Harrows

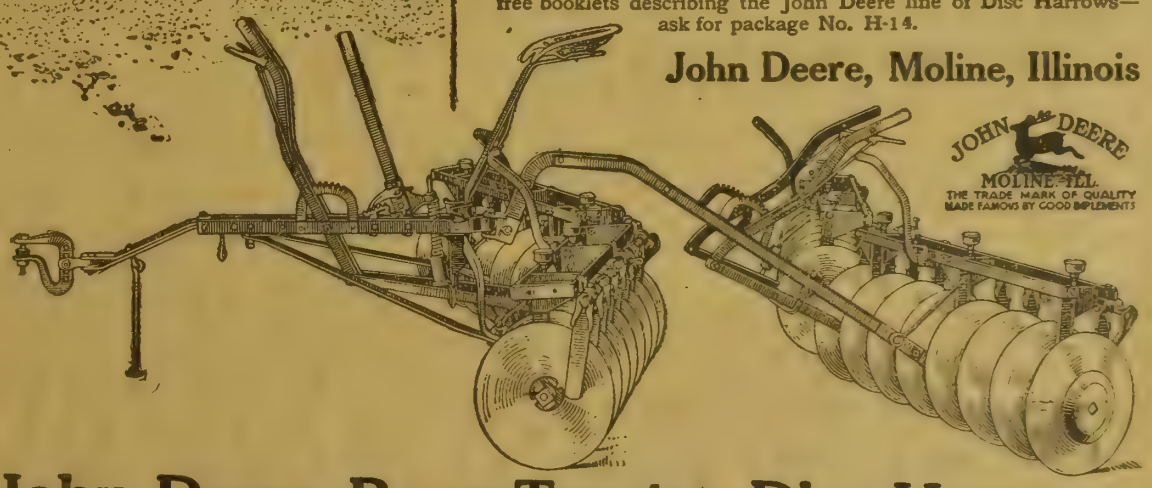
COMMENCING with the light, horse-drawn, single-action disc harrows, following with the double-action, later the heavy engine disc harrow and now both heavy and light tractor disc harrows, the John Deere factory specializing in the manufacture of disc harrows is rounding out thirty years' experience in this line of work—thirty years of unusually successful disc harrow building experience. That means that the buyer of a John Deere Tractor Disc Harrow isn't getting an experiment—he is assured of satisfactory service.

JOHN DEERE
TRACTOR DISC HARROWS

The JOHN DEERE PONY TRACTOR DISC HARROW is for use with any standard tractor; clevis is adjustable to suit height of tractor drawbar.

Flexible—equipped with a powerful pressure spring. Penetrates and pulverizes as desired because low tractor hitch and low coupling between front and rear gangs hold discs to their work.

Light running; no dragging around corners; rear gangs trail properly and run steady because the reinforced goose-neck connection to rear gangs is attached ahead of the front gangs.



Unusually strong—all steel main frame, double-bar gang frames, riveted throughout.

All standard widths, with standard size discs. Easily converted into horse-drawn, single- or double-action harrow by using proper hitch. The JOHN DEERE HEAVY TRACTOR DISC HARROW is extra heavy and strong for difficult work.

Get More Profit From Your Tractor

Good Serviceable Bulls

At Dairymen's Prices

They Are Sons of King Mead of Riverside

One of the best proved sires in the dairy world. Two of his daughters have produced over 1200 pounds of butter each in a year, strictly official test, one of which holds the world's butter record for two years 2,426.86 pounds. The average test of all of his daughters is over four per cent for the year.

The dams of these bulls are without exception beautiful individuals, with fine level udders and each with a good creditable official butter record. In each instance these records, without special fitting or care, may be taken as an index to their capacity under ordinary dairy conditions. Consider well these facts and decide to use one in your herd.

No. 1. Fourteen months old. Very nice individual, evenly marked. His dam has official record of 21.25 pounds butter in seven days as a four year old. She gave over 500 pounds milk in seven days and is one of the pleasantest milkers you ever saw. Price $250.00.

No. 2. Fifteen months old. It would be hard to fault his type. Possibly a little more black than white. His dam's official record of 18.59 pounds butter in seven days was made as a three year old. She is a show cow and by a sire that was four times a first prize animal at California State Fair. Her dam has a record of 823 pounds butter in a year. Price $200.00.

No. 3. Thirteen months past. Typey and nicely marked, little more black than white. His dam is the kind that would please any judge of a dairy cow and the kind that never quits. Official record 18.22 pounds in seven days. Price $150.00.

Their pedigrees will be furnished with all information by request. Write us at once if you want one of these sons of King Mead, as there are only a few left.

Tilly Alcartra—the Wonder Cow of the World

TILLY ALCARTRA—AGAIN

THE date has again arrived for the annual feature story about Tilly Alcartra, the world famous Holstein cow owned by A. W. Morris & Sons Corporation, Woodland, and this time Tilly furnishes the material for the most wonderful story ever written about any cow, for she has again smashed a world's record to smithereens. On the evening of Monday, January 6, 1919, she completed her sixth consecutive year under semi-official test with the world's milk record of 33,424.8 pounds milk, and the splendid record of 1323 pounds butter for the year. With a total of 2513.46 pounds butter, she also breaks the world's record for two years butter production.

Again it is proper to review her lifetime work up to date, and the following table shows her records for every lactation period since she dropped her first calf as a two year old; with the age at which she freshened each time:

At two years six months 17 days: Milk seven days, 490.40 pounds, butter 17.39; milk 285 days 14,837.2; butter 556.20.

At three years five months 26 days: Milk seven days 613.00 pounds, butter 23.15; milk 365 days, 21,421.30, butter 841.22.

At five years, one month, six days: Milk seven days 715.40 pounds butter 29.26; milk 365 days, 30,451.40, butter 1089.03.

At six years five months 20 days: Milk seven days 783.70 pounds, butter 32.22; milk 365 days 29,826.60; butter 1190.46.

At seven years seven months nine days: Milk 365 days 26,814.60 pounds, butter 1042.20.

At nine years two months 25 days: Milk seven days 724.10 pounds, butter 40.78; milk 365 days 33,424.8; butter 1323.

No other cow in the world, of any breed, has closely approached this magnificent total production of milk and butter, and as far as the writer knows no other cow in the world has made even a creditable showing during six consecutive lactation periods, and in the case of Tilly it will be noted that she has been tested every time she has ever freshened so far, leaving not a single loafing year in her life. There is one other fact that is of prime importance in judging her performance, and that is that she has never been rebred but once in her life. Of the seven times she has been bred she became pregnant at the first service six times, but last year made the single exception by accepting the second service. It will also be noted that between her first and sixth calves there elapsed a period of 80 months, and she has thus dropped a calf on an average of every 13 months and ten days while she has been making her many world's records. During her present record she has been carrying a calf for six and one-half months, being due to calve again in April.

Tilly Alcartra stands among the very top cows of all breeds as an economical producer. Her ration may look big to the ordinary feeder of ordinary cows, but careful analysis shows that Tilly consumes much less feed than an ordinary cow in proportion to what she produces. During the past year a very accurate account has been keep of the feed she consumed, and the following are the totals of her ration for the 365 days:

Ground barley 1325 pounds, ground oats 1325, bran 1325, soybean meal

Calf Scours

Save every Calf. High meat and milk prices make control of Calf Scours more necessary than ever before.

Scouring calves indicate a germ infection that is likely to run through your entire herd with serious losses. The loss of one calf is bad enough, but nothing compared to your loss when the infection spreads, as it will unless checked. Then your year's work in building up your herd is wasted and your profits lost.

B-K, the powerful germicide and disinfectant will promptly stop scours and finally banish it from the premises. B-K contains no poison, acid nor oil. When used internally it destroys germs, heals inflamed membranes, relieves irritation, restores healthy action. B-K may be given freely in milk and drinking water.

The B-K plan is simple and practical. It is giving wonderful results. Send for "evidence"

FREE BULLETINS: Send for our valuable bulletin No. 136, "Calf Scours," also information on other farm uses and our "Trial Offer." If your dealer does not have B-K, send us his name.

1165, cottonseed meal 532,, linseed meal 200, dried beet pulp 2550, silage 3000, alfalfa hay 5000, beets 21,000, pasture for four hours daily during nine months.

This ration was supplied to her as follows: At freshening she was fed ten pounds of the mixed grain ration daily. In about three weeks this was increased to 20 pounds daily, composed of 14 pounds barley, oats, and bran equal parts, four pounds soy bean meal, and two pounds cottonseed meal. After two and one-half months on this grain ration the allowance was cut to 16 pounds per day, and then to 14 pounds per day, the latter figure being maintained for five and one-half months, when the grain ration was increased to 15 pounds per day and was maintained at that figure for the balance of the year. During the time of her heaviest production she consumed as high as 80 pounds of beets per day, and her allowance of dried beet pulp varied from eight to fourteen pounds per day, while she was getting it.

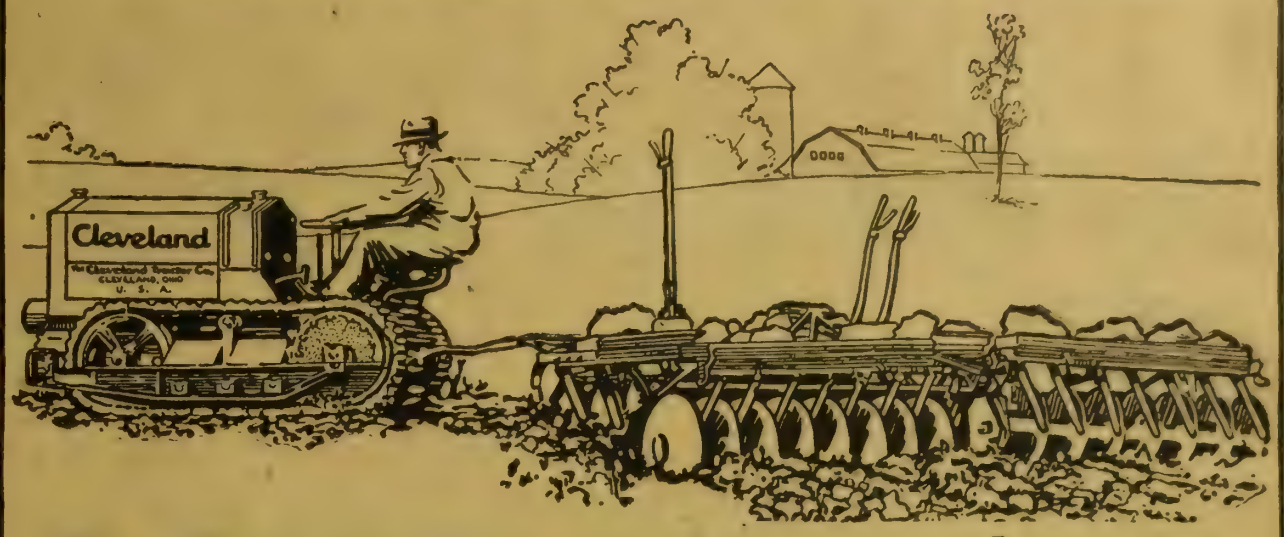
Tilly finished her last world's record performance in beautiful condition, having taken on considerable weight as usual, and looks fit to start off again in April in as good shape as she has ever been.

Just to gain some comparative idea of what Tilly is worth simply as a dairy cow, her milk last year if sold at $2.75 per hundred, a very conservative figure, would have fetched the tidy sum of $920. As a matter of fact her milk was actually sold throughout the year at a higher average price than that, yielding well over $1000.

Tilly has two sons in service in pure bred herds in California. Her oldest son is Prince Alcartra Korndyke, heading the J. S. Gibson Company herd at Williams. His first daughters have made yearly records as two year olds that place their sire well up among the yearly record sires of the breed. Tilly's other son is the well known King Morco Alcartra, in service in the Morris herd, where he has a large number of beautiful young daughters, none of which are yet in milk.

Tilly is the "only" cow in many respects. For instance: She is the only 40 pound cow that has made over 1100 pounds butter in one year; she is the only cow that has ever produced over 33,000 pounds milk in one year; she is the only cow that has ever made over 1000 pounds butter four separate times, and she did this during four consecutive lactation periods; she is the only cow that averages over 30,000 pounds milk per year for four years; she is the only cow that averages over 1000 pounds butter per year for six straight years, and that takes in every year since she first freshened; she is the only cow that has an average of 1000 pounds butter fat for two years; think of that butter average for six years!

Much more will no doubt be written about this wonderful cow in future years, for her physical condition and the condition of her udder are marvelous, promising many years of useful breeding and dairy production.



NEVADA LIVE STOCK NEWS

Jno. Matley of Reno is a horseman who does not fear the popularity of the farm tractor. He has lately purchased the stallion Londrecitos from the Whitehall Estates, Tracy, California, to head his Percheron stud.

J. H. Cazier & Sons of Wells, Nevada, have just shipped a Hereford bull and two heifers to E. S. Harriman of Northam, Nevada. Mr. Harriman is gradually embarking into the pure bred live stock business, having purchased a flock of pure bred Hampshire ewes last year. Mr. Harriman believes that high class stock will win out, even with hay at high prices. He modestly states that his check for hay this year was $14,000 from his 400 acres, after providing winter feed for some 200 cattle and 300 sheep.

The University of Nevada has secured a junior Hereford herd bull from J. H. Cazier of Wells, Nevada. The youngster is out of Lily Alamo by Lelax, a son of Dale. Her dam is Lily Alamo by Precursor by Beau Brummel. The calf is by Harris Standard 2nd by Standard. This calf has a combination of Bonnie Brae and Disturber topped on a combination of Perfection and Beau Brummel blood lines. Unfortunately he was calved in August so can hardly be successfully shown until he reaches maturity.

Cleveland Tractor

The Cleveland Tractor *does more than plow*

Your tractor, to be of real service and value to you, must do more than simply draw a plow. Plowing is *only the beginning* of what a tractor should be able to do.

It should also be able to do everything else in the preparation of the seed bed—the discing and harrowing, the planting. And it should do these things in a way that will not injure the coming crop.

The tractor should not only be able to draw the implement easily, but it should not spoil the good work the implement has done.

After the ground is broken, The Cleveland Tractor *goes over it* with the disc and the harrow, then *goes over it* with the seeder.

The Cleveland *rides on top* of the seed bed; *it does not sink into it and it does not pack the soil.*

The Cleveland *goes over soft ground* because it travels on its own endless tracks which it picks up and lays down as it goes along.

These tracks have about 600 square inches of traction surface, so the pressure on the ground is only about five pounds to the square inch—therefore there is not enough weight on the ground at any one point to inflict damage.

We repeat, The Cleveland Tractor *rides on top* of the seed bed. It *does not sink into it;* therefore *it does not have to wade or wallow through it.*

And because it *does not sink in,* it does not have to push the dirt in front of it and pack it down in order to navigate.

And because it is not obliged to push the earth in front of it and pack it down, the greatest possible amount of The Cleveland's power is available for accomplishing the work it has to do.

This is one of the reasons why *The Cleveland performs so much work on such a small amount of kerosene.*

These are but a few of The Cleveland Tractor's many advantages. It is capable of performing almost endless tasks in both tractive and stationary engine work.

The Cleveland does its work. It does it well. It keeps on doing it. It is the tractor that does the work you want a tractor to do, in the way you want it done.

DELCO

INCREASES FA

DELCO-LIGHT

DON'T you want to make the farm yield more with less work—and less help—increasing profits?

THE DELCO-LIGHT BOOKLET WILL TELL YOU HOW. MAIL THE COUPON RIGHT NOW.

How many thousand rubs has your wife given the washboard in the last year for the lack of modern equipment?

YOU NEED DELCO--LIGHT!

You buy all kinds of farm machinery to help do your work; most of it used only from three to thirty days a year. Why not provide modern machinery for the wife?

GET DELCO-LIGHT — IT WORKS 365 DAYS A YEAR.

More power means more progress. It means more comfort and convenience in the home; more time to do the important things—freedom from the little things that just take time and can be done with a machine.

GET THE DELCO-LIGHT BOOKLET RIGHT NOW AND SEE HOW DELCO-LIGHT WILL HELP TO KEEP THE BOYS AND GIRLS AT HOME AND MAKE THEM THE PROSPEROUS PRODUCERS OF THE NATION.

A man working continuously on a farm six days a week puts in 2300 hours a year. How would you like to save 1000 to 1500 hours on your farm per year?

THE DELCO-LIGHT BOOKLET WILL MAKE THE WAY EASY, AND THAT BOOKLET IS YOURS FOR THE ASKING.

How would you like to do your productive work by daylight and the winter chores by electric light?

THEN SEND FOR THE DELCO-LIGHT BOOKLET TODAY.

THE WATCH TOWER OF PROSPERITY

IT'S over, over there. Once more farm conditions are drifting toward normal. Grain farming, made necessary by labor shortage and war, will no longer yield its big profits. The world's grain supply is now released for distribution where most needed, and again the "Yanks are coming"—but this time to relieve the labor shortage at home. Now, as before the war, the origin of **sure profits**—the one **dependable source of income**—is the cow. And with the cow comes the demand for that greatest of all producers of cheap feed, the

INDIANA SILO

Before, and during, the war the Indiana Silo made millions for its owners by the cheap feed it produced and the saving it brought about on over 70,000 American farms. Now, during reconstruction, it will continue to be the greatest producer of cheap feed in the world. It is, indeed, the "watchtower of prosperity."

Released from Government work, our big mills are again cutting our choicest old Yellow Fir logs into stock for Indiana Silos. Our big 1919 silo feed book is now off the press and our EARLY BUYERS' DISCOUNT is in effect. Let us send you your FREE copy of our book and tell you just how much you will save by ordering your silo now for later delivery. Cut out this ad, write your name and address on the margin and mail to us **today.**

PROSPECTS GOOD FOR SAN FRANCISCO SHOW

Joseph E. Painter, manager of the California International Live Stock Stock Show, who has recently returned from conferences at the Royal at Kansas City and the International Live Stock Show at Chicago, reports an active interest in the forthcoming San Francisco show. "Everywhere," declared Mr. Painter, "there was unusual interest in the California show. Breeders from all over the East were in accord with the change of dates, which will make it possible for them to exhibit at Denver in January and then come to San Francisco for the February show here.

"The spring months are looked upon as most propitious to the Eastern exhibitor since November and December are devoted to local shows and to the Royal and International.

"Both the American Hereford Breeders Association and the American Shorthorn Breeders Association, which held meetings to which I was invited, decided to extend their appropriations for premiums for our show and this in addition to the promise of many sale cattle should prove attractive features to California breeders."

Farmers and stockmen who attend the California International Live Stock Show to be held in San Francisco February 8 to 16, will be given an opportunity to get facts and make observations which will inspire and aid them in their work.

They will find the show, in reality, a short course in animal husbandry—a concentrated, brief but convincing presentation of the vital points of live stock breeding. The teaching in this case will be done by observation and comparison, instead of by lecture and lesson. The spectators will have before them the best specimens of the different breeds, the choicest animals from great herds. It would be next to impossible to travel to all the different points to see these animals, but at the show they will be brought together, and a wonderful opportunity will be afforded to study size, type, conformation, finish, production and breed characteristics. Attending live stock shows has marked the turning point in the career of many a man.

Live Stock News Notes

Hartsook Polands in Demand

Maurice Rucker in charge of the swine department of the Hartsook Ranch, Lankershim, reports that Dr. N. Newton, who owns a ranch near Lankershim, recently visited the ranch and selected 19 head of Poland-China sows and gilts as a foundation herd.

Spencer Thorpe, a Los Angeles attorney, secured a promising young boar and gilt for his ranch at Santa Paula.

Army to Sell Horses

Now that the war is over the army is faced with the problem of disposing of a vast number of horses and mules. The British have held several sales in the East during the past few weeks, and now comes the announcement that the United States army will start a series of sales. The first sale will be held at the auxiliary remount depot Camp Kearny, Friday, January 10, and will continue until about 1500 head of horses and mules are disposed of. Included in the lot are 400 artillery horses, 500 cavalry horses, 500 lead mules, 50 wheel mules and 50 pack mules. Every animal offered has been accepted by the army inspectors and includes none that have been condemned. The terms of the sale are cash.

Gatewood & Son to Sell Polands

Chas. Gatewood & Son, Poland-China breeders of Fresno, will hold a bred sow sale January 28. It will be

recalled that this firm had the grand champion boar at the 1918 state fair—King's Big Bone Leader, by Big Bone Leader—and the fact that most of the offering will be bred to this boar adds much to the attractiveness of the offering.

Kern County Bureau Saves $15,000

George H. Peters, president of the Kern County farm bureau, states that $210,605.20 worth of live stock were marketed by the bureau with a profit of more than $15,000 to the members. The Kern County bureau was the first county to try the auction plan of selling live stock.

New Grazing Fees

R. H. Charlton, supervisor of the Angeles National Reserve, has received notice that grazing fees for the year ending April 1, 1920 will be as follows: Cattle, $1.20 per head; horses, $1.50 per head.

Under the regulations of the agricultural department, no sheep or goats are allowed to graze on the ranges, on account of the stream pollution. The privileges are restricted to the government land within the reserve, and there are at least 4000 head of cattle and horses now being grazed on privately owned lands within the Angeles National Forest.

Wool Growers Annual Meeting

F. A. Ellenwood, president of the California Wool Growers' Association announces that the next annual meeting will be held at the University Farm, Davis, January 22 and 23.

Problems of vital interest to the sheep industry will be discussed.

Shorthorn Sale During Frisco Show

The sale to be held during the California International Live Stock Show under the auspices of the California Shorthorn Breeders' Association promises to be an event of unusual attractiveness. Practically all of the prominent California breeders have made entries and word just comes that two of the leading herds of the Northwest will also contribute—the Day & Rothrock herd from Washington and the Frank Brown herd from Carlton, Oregon.

Catalogs for the event may be obtained by filing applications with Secretary D. J. Stollery, 320 Sharon Building, San Francisco.

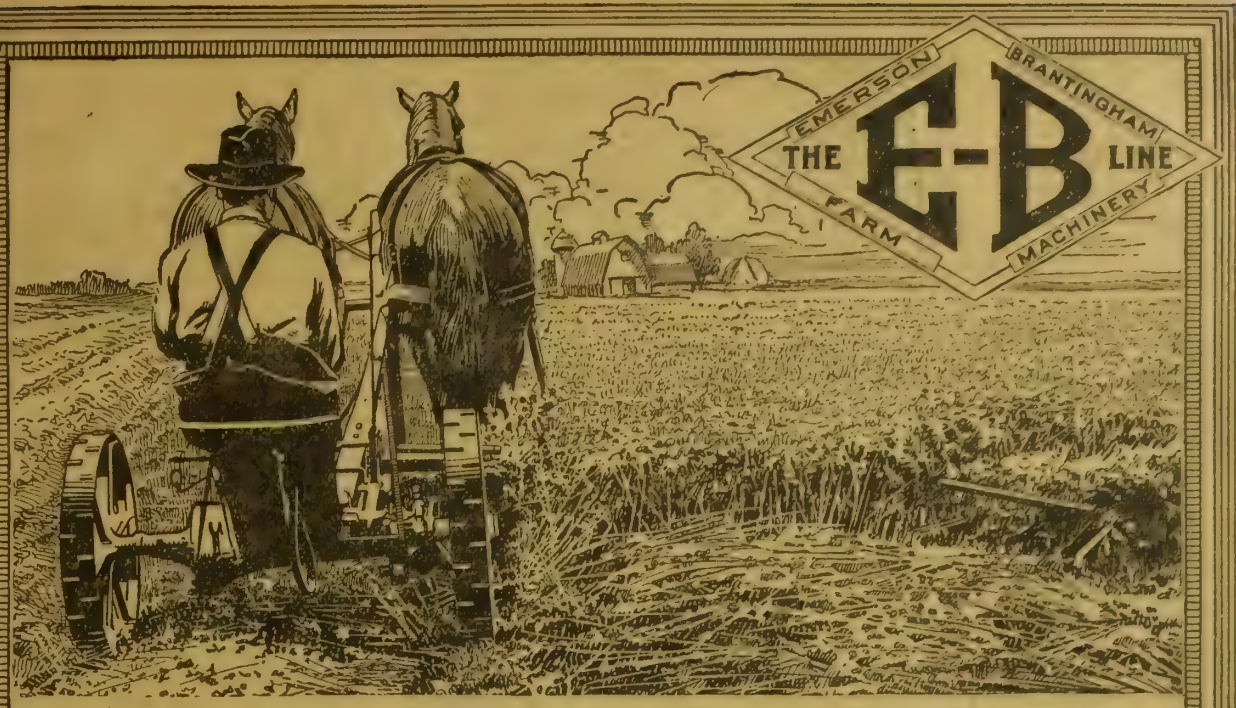
Berkshire Sale Arranged

W. M. Carruthers, president of the Western Berkshire Congress, announces that at a meeting, held last week in Sacramento, arrangements were made to hold the annual sale and meeting at San Francisco during the California International Live Stock Show.

Around 50 head of bred sows and gilts will be in offer and an especial effort will be made to attract a very superior class of consignments. President Carruthers states that in order to hold to the established high standard set by former sales, it is expected that members of the association will cut deep into their breeding herds.

The staging of the event has been delegated to the following committees:

Committee on program — James Mills, Hamilton City; A. B. Humphrey, Escalon; Homer Hewins, Calistoga; J. Francis O'Connor, Santa Rosa.



Committee on show—W. T. Sandercock, Sacramento; J. Francis O'Connor.

Committee on advertising — W. F. Sandercock.

Committee of Sale—J. Francis O'Connor; Ord L. Leachman.

A New 40 Pound Holstein

Malcomb H. Gardner, superintendent of advanced registry work for the Holstein-Friesian Association writes that the cow Nancy Lucy Hengerveld 277796 has shown a production of 620.2 pounds milk containing 32.04 pounds fat in seven consecutive days. She freshened at the age of six years, one month, 26 days. Her sire is Woodcrest Hengerveld De Kol 46514; her dam is Nancy Spofford 51336. She was bred by R. E. Haeger, Algonquin, Illinois; and she is now owned by David G. Maxwell, Waterloo, Iowa. With this production she is the 36th cow to obtain place in the list of Holstein-Friesian cows with productions exceeding 32 pounds fat in seven days. Computed on the 80 per cent basis, the equivalent butter claimed for Nancy Lucy Hengerveld amounts to 40.05 pounds.

Saves Crops and Labor By Cutting Twice as Much Grass in Same Time

Labor saving and crop saving are going to be more important than ever before in the history of the world.

The E-B (Standard) Mower is a big aid to conservation of man power and increase of crops.

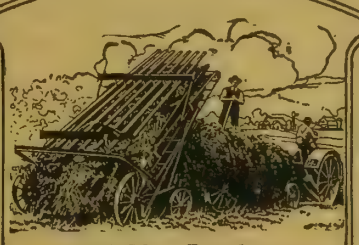
With its eight foot swath it does more work in less time with no more pull on the horses than many a five foot mower. Also made in 7, 6, 5 and 4½ foot sizes, with correspondingly easy pull.

The E-B compensating lever and spring carries the weight of the cutter bar on the drive wheels. No side draft. No weight on the horses' necks. Less wear and tear and longer life to the machine.

Do your mowing with the E-B and you'll have a more successful haying season, less work, a better crop.

See your E-B dealer and have him explain all of the points of E-B Mower construction.

EMERSON - BRANTINGHAM IMPLEMENT COMPANY, INC.
Established 1852 ROCKFORD, ILL.
The Most Complete Line of Farm Machinery Manufactured



E-B Side Delivery Rake
Rakes Three Acres in the Time of Two

Three swaths instead of two, three acres while others rake two, that is the story of the E-B Side Delivery Rake.

Labor saving, time saving, when time means the difference between a good crop and a poor one. Light, fluffy windrows that allow the hay to cure gradually and thoroughly.

Teeth can be changed from seat for wet hay or dry. Lever changes from rake to tedder instantly.

See your E-B dealer for complete facts.

E-B Hay Loader
Gets All the Hay — Without Wadding, Rolling or Twisting

The E-B Hay Loader cleans the windrow as it goes along. It handles the hay gently—does not tear stems and leaves or thresh out seeds. 66-inch sweep of rakes parallel to ground assures clean raking and easy action.

Continuous push upward prevents hay being drawn off rack—hay may be allowed to accumulate at rear of rack without clogging. Put an end to the hardest work of haying by putting an E-B Hay Loader on your farm.

Get complete facts from your dealer.

E-B Swinging Stacker
Lifts the Hay High—Places It Where You Want It

Building a firm, well-shaped stack is easy with the E-B Swinging Stacker.

Simple in construction, with strong wood frame and powerful steel angle plate and cast hinge block.

Load of hay received from rake after being carried upward is easily swung into any desired location by operator and dumped.

The rapidly increasing number of E-B Stackers used by the most progressive farmers in the country is proof of their being practical for your farm.

Production Butter Fat Everything Guaranteed

King Korndyke Pontiac

(shown above)

by every right of inheritance should transmit great production and high class type. His sons and daughters have already proven his ability to transmit type of the first rank—daughters with the big, deep bodies and the ample, fine textured udders that go with large dairy production. As for his sons, one of them sold for $6500.00 at public sale, going to head W. J. Higdon's fine herd at Tulare.

Two daughters of King Korndyke Pontiac recently freshened in our herd and made very satisfactory records. King Korndyke Pontiac Charlotte, under official test made 22.92 pounds butter in seven days as a junior three year old. Natoma Superba Pontiac, freshening at two years four months, made 19.25 pounds butter in seven days. We have several other of King's daughters to freshen this winter and they look especially promising.

You need one of his young sons in your herd. Come and see what we have on hand or write for pedigrees and prices. We make liberal terms if desired.

Sophie's Agnes---World's Champion Jersey

SOPHIE'S AGNES, a six year old Jersey, owned by Ayredale Farms, Bangor, Maine, has just surpassed the coveted mark of 1000 pounds of fat in a year. She is the first Jersey cow to reach this mark, and she surpassed it by about the same fraction that her grandam, Sophie 19th of Hood Farm, fell short of it.

Besides being a remarkable record of itself, it shows that champions can be bred from champions, and that great cows are not necessarily freaks of nature. Sophie's Agnes is a line bred Sophie Tormentor, and there is greatness on both sides of her family tree. She was bred by Hood Farm, Lowell, Massachusetts, and was sold at public sale to her present owners for the record price of $10,099. She is thus the record holder in two ways, and has justified the high price that was paid for her. She was left at Hood Farm to finish her record, and she will now carry her laurels to her new home.

Figures speak louder than words in the praise of this great line of breeding; and the qualities of heavy production, persistency and prepotency, or "breeding on," furnish an example that cannot be duplicated in the records of any herd or any breed.

Sophie's Agnes has made the greatest Jersey record for one year. Her sire, Pogis 99th of Hood Farm, has the greatest bunch of high producing daughters that any bull can claim, and his dam, Sophie 19th, the grandam of Sophie's Agnes, is the champion cow of all breeds, all ages, for "long distance" production.

Beginning with Sophie's Agnes, it is possible to present here the most educational and inspirational array of figures that the pages of dairy history contain. It is largely because of the far sighted policy, its persistent pursuit and the breeding ability displayed at Hood Farm that any such figures can be compiled. Mr. C. I. Hood, whose fame as a breeder of Jerseys extends back over many years, has consistently tested his herd for production ever since 1904, when some of his cows helped to make up the "St. Louis Exposition Jersey herd," which defeated all competition in the economic production of butter fat.

Authenticated Records of Sophie's Agnes

Latest Record by Months.

Test began—	Days.	Milk lbs.	Fat Pct.	Fat lbs.
December, 1917...	31	1735.5	6.10	105.87
January, 1918....	31	1728.5	5.49	94.89
February	28	1458.0	5.58	81.36
March	31	1444.6	5.99	86.53
April	30	1368.2	6.13	83.87
May	31	1357.2	6.19	83.89
June	30	1347.6	5.77	77.75
July	31	1330.1	5.66	75.28
August	31	1245.7	6.07	75.61
September	30	1101.3	6.65	73.24
October	31	1102.5	7.24	79.82
November	30	994.7	8.24	81.95
Totals	365	16212.0		1000.07

Age, six years one month.
Average percentage, 6.17.

Previous Records

February 8, 1915, to February 7, 1916—365 days, 10,171.4 lbs. milk, 6.09 per cent fat, three years 3 months old, 619.89 lbs. fat.
August 1, 1916, to July 31, 1917—635 days, 14,149.7 lbs. milk, 5.90 per cent fat, four years nine months old, 834.88 lbs fat.
Class AA—Carried calf 166 days during 1916-1917 test.

Her Feed

J. E. Dodge, manager of Hood Farm, gives the feed record for Sophie's Agnes. This is information seldom given because of the enormous appetite that record cows have. In Agnes' case the feed can be computed and its cost deducted from the value of her product, and a substantial profit shown. During her test she consumed various grains as follows:

Wheat bran, 1095 lbs.; corn meal, 1095 lbs.; gluten feed, 1825 pounds; ground oats, 1460 lbs.; Schumacher feed, 730 lbs.; total, 6205 lbs.

Sophie's Agnes

First Jersey to produce 1000 pounds of butter fat, is a daughter Pogis 99th of Hood Farm and a granddaughter of Sophie 19th of Hood Farm.

Sophie 19th of Hood Farm

Former world's champion. Total production for seven official yearly tests 91,869 pounds of milk and 5,280 pounds butter fat. She is the dam of Pogis 99th of Hood Farm, the sire of Sophie's Agnes.

JERSEYS

The PROFIT BREED

WHY waste feed on cows that skim their own milk? Jersey's produce the highest per centage of butter fat at the lowest feed cost. The man with one Jersey is never satisfied until he has a herd. Write to Breeders for pedigrees and prices. Let us send you profitable facts about the Jersey.

Easy Milking

Is largely a result of a healthy udder and teats. Any condition that makes a cow restless interferes with the milk flow and makes milking hard.

To keep the udder and teats always in the pink of condition use BAG BALM, the great healing ointment. A sure, quick remedy for Caked Bag through its soothing and penetrating effect on the tissues. Great for any external hurt, chapping, cuts or inflammation.

A 60c package is a good investment.
Druggists and feed dealers sell it.

Valuing the feed at an average of $60 per ton, her grain feed cost is $186. She had besides alfalfa hay, clover hay and beets. The value of 1000 pounds butter fat at 50 cents per pound is $500. Sophie's Agnes, it can be safely said, made a substantial profit over her feed cost during the period of her test.

Her Sire, Pogis 99th

Pogis 99th of Hood Farm is not only the most highly productive sire of the Jersey breed, but of all breeds. He has just qualified for an A. J. C. C. gold medal, and at nine years of age has 35 daughters in the Register of Merit with a total of 49 yearly records. The records of his six best daughters (none over six years of age) are given here:

	Milk lbs.	Fat lbs.	Age Yrs.	Mos.
Sophie's Agnes..	16,212.0	1000.07	6	1

Sophie 19th, Dam of Pogis 99th

Sophie 19th of Hood Farm, dam of Pogis 99th and grandam of Sophie's Agnes, is herself a descendant of great individuals. Evidence that this great line of blood is "breeding on" can be readily obtained by a comparison of records and ages. The progression indicates that the end is not yet in sight. Sophie has done more than transmit equal qualities through her son. Many of her granddaughters have bade better records than Sophie did at the same age. Sophie's authentic records which make her "long distance" champion are:

Age, Years—	Milk, Lbs.	Fat, Lbs.
2	7,050.2	395.9
3	9,924.8	570.8
4	14,373.2	854.4
6	15,099.4	931.9
7	17,557.8	999.1
9	11,915.4	680.9
11	15,948.2	847.8

The cattle breeding and dairy world is indebted to Mr. C. I. Hood for his untiring efforts in behalf of greater efficiency in dairy production. His zealous support of the Jersey cow and his suchess in breeding her have been rewarded by many high honors, not the least of which is the development of the first 1000-pound butter fat producing Jersey. — American Jersey Cattle Club.

HIGHER FINISH WITH SILAGE

Include silage in your ration for fattening live stock, for silage cheapens the cost of gains and produces a higher finished animal, advises P. K. Heerwagen of the Colorado agricultural college. Mr. Heerwagen says:

"Silage cheapens the cost of gains, as shown by results of steer feeding experiments at the Colorado experiment station. Silage not only made a saving on hay, but steers fed silage along with grain and hay required less grain, one ton of silage replacing 128 pounds of barley and .297 tons of alfalfa.

"When silage is fed with a ration of grain and hay a higher finish on the animal results. This is due to the fact that the silage, which is a palatable, succulent feed, keeps the digestive system in the best of condition and improves the natural thrift of the animal.

"Cattle that are fed silage do not shrink in transit any more than do those receiving dry roughage alone. Silage fed cattle should be fed hay alone the last two or three days previous to shipping, as this puts them in better shape for the trip."

Baby Chicks—We guarantee full count of live chicks that will please you. Hoganized White Leghorns exclusively. Send for prices. White Leghorn Hatchery Ranch, Pomona, California.

White Leghorn Chicks, $13.00 per hundred in February from stock bred for fifteen years for vigor and winter egg production. A. P. Ward & Son, Calistoga, California.

White Leghorn Baby Chix from heavy laying (Hoganized) stock; $15.00 per 100. We guarantee safe arrival. The Pioneer Hatchery, 409 Sixth St., Petaluma, California.

Chix—Barred Rocks, R. I. Reds, Orpingtons, Anconas, Minorcas, Buff, White and Brown Leghorns. Breeding Cockerels. Enoch Crews, Seabright, California.

Blue Andalusian Cockerels—A fine well developed bunch from heavy laying strain. Get your order in early. Prices reasonable. J. R. Huddleston, 342 Edgeware Road, Los Angeles.

Hatching eggs from heaviest laying scientifically line bred (Hoganized) White Leghorns on the coast. Interesting circular free. Waldeck Ranch, Burbank, California.

For Sale—Two 400 egg Cyphers Incubators, latest model, used two seasons, $30 each. One 240 egg Cyphers, $20. All in good condition. J. H. Goodier, Paradise, California.

Spring Chix—Rocks, Reds, Orpingtons, Minorcas, Brown and White Leghorns. Satisfaction and safe delivery guaranteed. Tobener Hatchery, Washington Ave., San Jose.

Baby Chicks (White Leghorns) shipped on approval before remitting. No weak ones charged for. Schellville Hatchery, Schellville, California.

Black Orpingtons Lay, Weigh and Pay—Prize winners at leading shows. Write for mating list. IVEYMOOR FARM, San Leandro, California.

We Have the Large heavy laying S. C. White Leghorns. Order now for early chicks. Tupman Poultry Farm, Ceres, California.

Choice White Wyandotte breeding cockerels $5.00, eggs $3.00 and $5.00 per 15. R. W. Stawetski, Route B, San Jose, California.

Baby Chicks, White and Brown Leghorns, R. I. Reds, Barred Rocks. E. W. Ohlen, Campbell, California.

Buff Orpingtons, Buff Ducks, Bourbon Red turkeys. The Ferris Ranch, S. Reservoir, Pomona, Cal.

POULTRY

THE MISSION HATCHERY
The Utility breeds that pay the best. Our White, Brown and Buff Leghorns, R. I. Reds, Barred and White Rocks, Black Minorcas. Our breeding stock is good, selected for laying qualities; chicks hatched right and priced right. If interested in poultry for profit write for our circular, its free, and should interest you. The Mission Hatchery, Box 27, Campbell, California.

Baby Chicks: Why Pay More from Ordinary Layers? "Best chicks I ever bought;" "Greatest layers we ever had." Why? Bred 20 years to lay 200-290 eggs yearly. 12 varieties clearing customers $5.00. Valuable circular with proof free. Half booked to April. Few hundred open January, bargain 40,000 egg hatcheries full now. Many repeat orders, monthly, yearly. Breeders, pullets reasonable. James Beeson, Pasadena, California.

Baby Chicks, Anconas, Barred Rocks, R. I. Reds, Black Minorcas, White Minorcas, Buff, Brown, and White Leghorns (Macfarlane Strain) hatching each week. Write for circular. SPECIAL PRICES if ordered this month. Poultrymen's Co-operative Hatchery. D. E. Doke, Mgr., 732 So. Spring, Los Angeles.

Book Your Orders with the Stevenson Hatchery, 19 Center Street, Watsonville, California, for Day Old Chicks Black Minorca, Barred Plymouth Rocks, White Leghorn or Anconas from first class utility stock.

CATTLE

Guernseys—We will sell stock from our prize winning, high producing herd, at reasonable prices, valued according to individuality and breeding. Our supply is limited but if the buyer wants a number of animals and will write us we will furnish him with particulars. Revada Guernsey Farm, Yountville, Napa Co., California.

SHORTHORN CATTLE, SHROPSHIRE SHEEP. Berkshire Hogs and Shetland Ponies. Get our prices and descriptions before buying. Butte City Ranch, Box C, Butte City, Glenn Co., California. W. P. Dwyer and W. S. Guilford, Owners.

Dairy Herd for Sale—70 head of Dairy Cows and bred Heifers, also some younger heifers and heifer calves, nearly all high grade Holsteins. Also one fine Registered Holstein Bull. Address Box 4, California Cultivator.

Registered Holstein Bulls from high producing dams for sale at reasonable prices. Also a few choice females. McAlister Sons, Chino, California.

Registered Shorthorns (beef) calves and yearlings for sale. Both sexes, reds and roans. Choice goods breeding. Fair Oaks Ranch, Willits, California.

Ayrshires (registered) — A few young bulls, heifers and cows in milk at a bargain for quick sale. A. MacMinn, Phoenix, Arizona.

Yearly Record Holsteins—Bulls from 500 to 1000 pound dams and by World Record sires. A. W. Morris & Sons, Woodland, California.

Breeders of Registered Shorthorns—Milk Strain; choice young stock for sale. John Lynch Ranch, Box 321, Petaluma.

Registered Holstein Bulls of various ages for sale. Millbrae Dairy, Millbrae, California.

Sunshine Farm Jerseys—Tuberculin tested. "Production counts." E. E. Greenough, Merced.

Jersey Bulls—Type and production, easy terms. N. H. Locke Co., Lockeford, California.

Registered Guernseys for sale. P. J. Weisel, Santa Fe Springs, California.

MACHINERY

USED RANCH MACHINERY
Guaranteed to do same work as new.
WE SELL FOR LESS. CALL AND SEE.
WINDMILLS: 8-ft, $29 to $35; 10-ft. $39 to $45; 12-ft. $55 to $65; 16-ft. $135; 12-ft. Aermotor and steel tower $110.
REDWOOD TANKS:
New and used, all sizes.
NEW GALV. TANKS: 1000 gal., $39; 2000, $53. Used galv. tanks 4500 gal., $90; 6000, $135; 7000, $145.
RANCH TOOLS: 10-ft. Hoosier Drill, $95; mowers, $45; Fresno, $16; beet drills, $35; broadcast seeder $18.50. Fine 2-gang disc plow $75; Avery tractor only used month $450, runs like new. Deere 14-in. riding plow $35; 4-gang Fosmir Stockton $35; brand new P. & O. tractor plow $230; 3-gang disc $85; 3-4-gang disc plows $120 to $150; spike harrows $10 to $18; cable 10c; Aspinwall potato planter, $75; Planet Jr. new potato digger $20; new Planet Jr. two horse riding cultivator, never unpacked, $95; 2-row Killifer bean cult. $25 to $45; weeder $8.75; 500 ft. 2-in. galv. pipe 27c; bone grinders, cheese cutter, wire stretchers, shears, discs for plows, sundries.
PUMPS: Double acting Ames $145; Bulldozer pump jack $49; large size $98; No. 6 horiz. Gould centrifugal $95; No. 4 two-step $150; No. 7 vert. cent. $150, many others, also rods, pipe fittings. Also buy good serviceable material. DEMMITT CO., Upstairs, 120 No. Main. Yard 816 Yale, Los Angeles.

Waterloo Boy Tractor, two speed, all bearings incased, runs in oil, very little used. Also new Knapp orchard tractor plow. H. S. Blossom, Lakeside, California.

Gasoline Engines, the largest stock of Used gas engines in California from 2 h. p. to 100. Thoroughly overhauled. Machinery Exchange, 733 North Spring St., Los Angeles.

A Samson 10-25 practically as good as new. Foss Bros., Lakeside or C. E. Foss, Alpine. Both parties addressed S. D. Co. California.

For Sale—Sampson Tractor 10x25, overhauled and in excellent shape. Cheap. Geo. E. Small, Terra Bella, California.

FOR EXCHANGE

For Exchange—80 acres, good alfalfa and cotton land, Casa Grande Valley, Arizona for small acreage in Southern California. Address L. F. Beaty, 1061 Esperanza Avenue, Long Beach, California.

Exchange—Beautiful home in Berkeley for country realty. Address 5809 Ocean View Drive, Oakland.

FARM LANDS FOR SALE

FOR SALE—HEMET VALLEY
80 acres of as fine soil as there is in California. Grow alfalfa, beets, beans, sweet potatoes, corn. Two artesian wells, also el. pumping plant, large cement reservoir, liveable six room house, large barn stanchions for 75 cows. This farm especially adapted to dairying and hog raising. In barley at present, one-quarter crop goes with ranch. Appraised at $325 per acre will sell for one-half cash, balance easy terms. This is one of the best buys on the market. Deal with owner and save commission. No agents. Address, Owner, 132 N. Hope Street, Los Angeles.

For Sale—640 acres of foothill land, $20 per acre, one-third cash, balance long time; 400 acres of this land has been farmed to grain for many years. New set of first class buildings, 4 years old. Excellent stock ranch. Nelson Realty Company, "Pioneer Dealers in Almond Land," Arbuckle, California.

For Sale—400 acres, improved ranch, 7 miles south of Tulare, ¼ mile from State Highway. Fairly good buildings, excellent pumping plant with shallow lift, 95 acres alfalfa, 100 acres grain land, balance pasture, but can all be plowed, $90 per acre. Beckwith & Anderson, Tulare, California.

For Sale—Choice Yucaipa Valley, 6 acres apple orchard, 5-room house, garage. Price $6800, terms. Ten acres apple orchard, 5-room house with garage, price $750 an acre—terms to suit. R. D. 2, Box 4, Yucaipa.

Wanted To Sell, trade or exchange 80 acres of alfalfa land in Imperial Valley, for a dairy having 60 to 80 cows, together with lease on place to keep them. Address Frank C. Dias, Holtville, California.

For Sale—300 acre mountain ranch, timber. Splendid for prunes, apples. Free water. Terms. E. A. Maas, Woodleaf, Yuba Co., California.

RABBITS

Pine Ridge Rabbitry, Monterey, California. A fine line of Flemish Giants, New Zealand Reds and Long Haired Blacks. All stock guaranteed. Write for particulars.

For Sale — New Zealand rabbits. None better, with litters or without, always in stock. Los Angeles Route 9, Box 485 Vermont Heights, West Athens. Burlingame Rabbitry.

Money in Rabbits
Raise rabbits for us. Will pay $6.00 per pair. Send stamp for particulars. H. E. Gibson Co., Arcadia, California.

For Sale — Rabbits, New Zealand and Flemish Giants, young stock. Paul Kruger, Watsonville, California.

GOATS

Largest Herd Swiss Toggenbergs on the Coast. 100 grade does bred to my $1000 Buck, Captain No. 256, A. M. G. R. Association, due to kid in February and March, $40.00 each, lots to suit. Crating $2.00 extra. Stamp. Rae P. Williams, Oakland, California.

PIPE

"TESTED" and "GUARANTEED" Screw pipe, casing, valves and fittings. Riveted slip joint pipe; all sizes. New and used. "Pacific" pipe for all purposes.
PACIFIC PIPE CO.,
Main and Howard Sts., Est. 1906, San Francisco.

ENGINES

Several New and Slightly Used Engines, ARNOTT & CO., Implements, 112 S. Los Angeles St., Los Angeles.

TRACTOR SCHOOL AT LINCOLN

A tractor training course for a period of three weeks is to be established by the state board of education in Lincoln from January 20 to February 8. This course will provide for both day and evening classes.

It will consist the first week of a study of gas engines, carburetors, ignition systems. The second week tractors, their assembling, disassembling, operation and repair, the third week a practical operation of a tractor in plowing a field. The instruction will be in the hands of experts. The course is open to anyone interested. The training center will have its headquarters at Lincoln Garage. All interested in this matter enroll at once with C. M. Fulkerson of the Lincoln union high school.

ILLUSTRATED CATALOGUE

An illustrated catalogue, the illustrations of which mean much to the careful reader, is that of the Fancher Creek Nurseries. In addition to being an illustrated catalogue, it is a practical planter's guide and has in it many suggestions for planting and care of orchards. Still more, it enables the careful planter to arrange his orchard so as to secure continuous ripening of any desired fruit, for practically every fruit listed is given a harvesting month.

The illustrations, like those of the Zante currant on Page 48, are very large, filling, in fact, the entire page. Mr. Roeding's idea is that large sized illustrations are of value in giving more correct idea of the fruits.

The ornamental feature of the book is especially valuable. Illustrations are shown, together with plans, or sample sketches, such as will be furnished to customers by the landscape adviser connected with the company.

Smith Brothers, Southern California distributors of the Cleveland Tractor, have been appointed distributors for Arizona also.

"This Is *My* Hired Man"

"I never had a man who was as willing to work as this little stick of dynamite—nor one who did his work as well either. Rain or shine, hot weather or chilly, day or night—this little fellow is always on the job.

HERCULES DYNAMITE

is what you need to help you work *your* place this season. I used to try to do all my heavy work by hand too. Dug post holes and ditches and the holes to plant my young trees in until my back was nearly broken. But no more of that for me. *I use dynamite now.*

Last year I sent to the Hercules Powder Co. for their book "Progressive Cultivation." It's easy to get—they send it to you *free* if you sign and send in the coupon that is printed at the bottom of every one of their advertisements.

Better send for this book. It tells you all about the use of dynamite on the farm and in the orchard."

Big Money In Stump Land

H. G. Hunzicker, of Foster, Wash., pulling a 24-inch fir stump with deep tap roots out of hard ground.

This man made $35 Land Worth $200 an acre Pulling Big stumps by hand

CLEAR your stump land cheaply—no digging, no expense for teams or powder. Your own right arm on the lever of the "K" Stump Puller can rip out any stump that can be pulled with the best inch steel cable. I guarantee it. I refer you to U. S. Government officials. I give highest banking references.

HAND POWER
K Stump Puller

Showing easy lever operation

Weight, without cable, 171 pounds

One man with a "K" can outpull 16 horses. Works by leverage—same principle as a jack. 100 lbs. pull on the lever gives a 48-ton pull on the stump. Made of best steel—guaranteed against breakage. Has two speeds—60 ft. per minute for hauling in cable or for small stumps—slow speed for heavy pulls. Works equally well on hillsides or marshes where horses cannot go.

Write me today for special offer and free booklet on Land Clearing.

No Stump Too Big For The K

Eggs Higher than Ever— And You CAN get them

if you help your layers. Hens cannot lay heavily unless they *eat, digest* and *assimilate* plenty of feed. Many poultry rations, especially in these times of food conservation, are inferior and do not produce results. They are not palatable, are coarse and hard to digest.

Pratts Poultry Regulator

makes good rations better, is an absolute necessity in inferior ones. *"Guaranteed satisfactory or money back"*

Pratts Poultry Regulator flavors feed mixtures, thus inducing the layers to eat more. It strengthens and invigorates the organs of digestion and assimilation so the birds "get the good" of what they eat. It tones up the whole system insuring that perfect health which is the basis of regular production. It speeds up the layers and brings a steady flow of high-priced, profitable winter eggs.

Get a supply of Pratts Poultry Regulator from your dealer today. Make every hen lay *now* while fresh eggs are bringing big money.

Feeding for Eggs

Written for California Cultivator By Jean A. Koethen

TEN days ago, hoping to gather up some little crumb of help for the discouraged poultryman who was finding the odds against him in his effort to feed economically, I sent out letters to 15 representative poultrymen asking for suggestions for econonomical wartime feeding. Today the word comes that there is to be no more war. Sooner than we dared hope the war is at an end and we face the new era of reconstruction and rehabilitation. Already there is a little drop in feed prices, and while there is still a long pull ahead of us before feed conditions are what they were five years ago, the dawn is plainly to be seen, and those who have held on and done their best in spite of loss may look for the reward of their persistence.

Perhaps it was because the men to whom I wrote already perceived the dawn of a better day that I received answers to only five of my letters. Be that as it may, I am grateful for their suggestions and feel sure Cultivator readers will be helped by them.

J. L. Harrison of Pasadena, well known to all of us as a thoughtful student of poultry husbandry, says the poultry ration is just as well off without wheat, except in the form of bran. "In fact, American breed hens get along better on the coarser, bulkier grains than they do on wheat, which is too compact a grain to be fed without more roughage than is apt to be available for yarded fowls. Leghorns do better on a straight wheat diet than do the heavier fowls, with fewer crop-bound cases in the flock. The most serious problem of wartime feeding is the continued shortage of a good, dependable grade of wheat bran. Commercial egg mashes, so-called, may be all right for the city lotter, but the cost looks prohibitive to the man accustomed to buying bran, corn meal, meat scrap, etc., for a few hundred fowls and mixing the mash to suit seasonal requirements. The mixed feed sold as a substitute for wheat bran varies in appearance and palatability and much of it looks like poor truck, barley hulls being decidedly in evidence with only here and there a flake of wheat bran. Even the ready made mashes are full of this junk and the hens must worry along until the war is over and a world's surplus of wheat has been established."

One of the questions asked related to the value of green feed as a substitute for grain, and another to the possible use of broken beans, potatoes carrots, etc., to eke out the more expensive grain. Of this possibility Mr. Harrison says: "The man who tries to economize in poultry feeding can safely figure out a marked saving in the size of egg basket needed to gather the output. Green feed and vegetables, while helpful in conditioning hens for egg making, will not make eggs worth mentioning without grain feed. Split beans, formerly to be had at the warehouses for a mere song, but now worth good money, make a good ration for work horse or laying hen but now the cost is too near the grain price to be alluring to the poultryman.

"Laying hens, or hens which should be laying, seem to require just about so much green feed and no more. Repeated experiments have shown that a pen of hens given all the scraps and vegetables from the kitchen laid just as well as but no better than the next pen of fowls, which had only the regular green feed, but no fruit, vegetables or scraps. Still, there is little danger of supplying too much green in this arid country and a variety of greens at all times and as much as the fowls will eat is to be strongly commended.

"For the past ten years slightly sprouted seed barley has been the base of the nightly grain ration, one-quarter to one-third bulk of cracked corn being added to correct the lack of fats in the barley. Milo carries practically 90 per cent of the food value of Indian corn though not so palatable, and not advisable unless 25 per cent lower in price than cracked corn. It is a mighty bad practice to be continually shifting from one to the other for hens are decidedly creatures of habit and resent any experiment or innovations in the line of feeds."

C. H. Kline of the Kline Poultry Ranch, Burbank, says: "We have substituted oats and barley for wheat, but have not tried potatoes, pumpkins, etc. Where it has come under my observation and vegetables were cooked they did help materially. Green feed cannot be substituted for the grain feeds, but we have plenty of oats, barley and milo for grain feed. Have never fed beans, except the soy beans, which proved to be very hard to digest, but I think if they were thoroughly cooked they might be all right. All cooked feed for chickens should be used sparingly, in my estimation."

C. R. Brown of Arlington thinks that with eggs at present price it would pay to feed anything that will produce the eggs.

"There is never any use trying to economize on chicken feed except in the selection of grains, which vary very little in feeding value, according to the market price. Regardless of price I do not believe it pays to feed much over 50 per cent of the grain ration in barley. At present I feed about 15 per cent cracked corn, 45 per cent milo in the head and 40 per cent sprouted barley (sprouts just started). I find the milo in the head a very good feed and about the cheapest of the grains just now, as it can be bought for $35 a ton or less and the waste is only about 20 per cent.

"As the market is now I think we can do better buying the ready mixed mashes than buying the material and mixing our own. At this season it pays to use the buttermilk mash. Green feed is necessary for its tonic effect but it is too bulky to produce eggs. A good patch of early barley is a great help to winter egg production.

"I have never tried beans but have often seen broken beans in the scratch feed. Damaged feed of any kind is dangerous. Stock beets and potatoes are both good. I feed the beets after cutting them up with a root cutter into small strips. The potatoes I chop fine and mix in moist mash. They can also be cooked and mixed in the mash. Radish tops are good feed and the radishes chopped fine and mixed in the moist mash make it pungent and appetizing."

B. R. Holloway of Van Nuys does not believe in attempting to substitute either vegetables or green feed for grain, but has used weevilly Black-

eye beans with good results when they were cheap. The beans were cooked and fed with wheat and Gyp corn. For scratch feed he uses Gyp corn, cracked corn and barley, part of the barley being sprouted and part hulled.

J. T. Johnson of San Gabriel has not tried potatoes or other vegetables. When a few damaged beans were left on his hands the birds refused to eat them. He feeds milo, barley and cracked corn and a mash of his own mixing. Cut alfalfa and barley furnish sufficient green feed.

I have not had the pleasure of visiting the Essenberg Ranch at West Riverside, but reports which have come to me of the work done there are interesting and suggestive. Mr. Essenberg owns ten acres and rents adjoining land which he plants to grain. He makes his 2000 hens pay by raising all his feed except the mash. Indian corn and dwarf milo are grown on his own ground, wheat and more milo on the rented ground. The hens are allowed to range on alfalfa and green barley a part of the time the range being supplemented by cut greens and mangel beets.

From the above suggestion it is evident that there is little now to be said about feeding for eggs. A good laying mash the hens must have, preferably a buttermilk mash. The scratch feed must contain a variety of grains, and should include Indian corn, if possible. Greens are absolutely necessary to high production, but cannot be made to take the place of grain. These are the essentials. If other things can be raised or bought cheaply, they may be added for variety's sake, but will never take the place of mash, grain and greens. When barley is used it is best to sprout a part of it. This is a practice followed by nearly all good feeders.

POULTRY IN FOOD PROGRAM

The importance of poultry in the food program for world relief is pointed out by the food administration, which calls attention to conditions that should make poultry raising unusually attractive during the coming year.

While poultry is not as well adapted for export as pork or beef, it can nevertheless be shipped in frozen condition. Chickens are used to a considerable extent by military hospitals and the American navy is also a large purchaser of poultry.

The principal demand, however, will be for domestic consumtpion to replace, in a measure, the meats needed for export. Outstanding merits of the poultry industry are the rapidity with which flocks may be enlarged or diminished in response to demand, and their adaptability for home consumption at any time of the year.

During the period of reconstruction these features make poultry a branch of agriculture having minimum market risks. The period between production and marketing is also relatively short; much of the labor can be performed by women if necessary, and under average farm conditions the feed required for poultry is largely a by-product not readily marketable. The American hen practices conservation by instinct.

Compared with other animals, the domestic fowl is a small unit, but wide distribution and large numbers make it a very important factor in supplying the nation's food requirements.

In anticipation of continued needs for large quantities of both poultry and eggs, the food administration points out the desirability of keeping laying hens and choice pullets, also of marketing only such surplus stock as is well developed and plump.

In brief, the poultry industry appears to be one of our national food resources which may wisely be developed both in amount and quality. The meat and eggs of our domestic fowls will help to maintain nutrition at home while the United States is supplying vast quantities of the foods required to stop famine and anarchy abroad.

HENNERY HINTS

If you want standard size chickens you must breed from standard size birds. Runts can be counted on to breed runts.

Pick out your best hens to supply hatching eggs. Better raise 20 really good birds than a hundred culls. It is surprising what a nice flock can be raised from two or three first class hens.

Mate breeding pens the first week in January and set every hen that goes broody after that time. If there are no broodies, start that small incubator going. A 50 or 60-egg machine is a handy thing to have for early hatching. If you have neither hen nor incubator it is better to buy a few chicks from the hatchery than not to have early chicks. Order now for February delivery.

Are your yards a mixture of pure bred and mongrel and breeds of assorted sizes and colors? For the love of good poultry, cut out the dunghills, and raise one breed only. There's nothing to be gained by mixing, and one breed is as good as another.

Fresh air is the best preventive of colds, but don't let it come in through a knot hole, or a crack in the wall. Open up the front of the house and fill it so full of oxygen that you won't know there is a chicken there. Oxygen is the deadly enemy of roup.

Watch for mold in scratching litter and grain after the first rains. Mold kills a good many chickens, even in sunny California.

You can't make bricks without straw or eggs without protein. Give the hens all they want of the right kind of feed and they will lay for you.

KEEP THEM LAYING

Eggs! Eggs! Eggs! More and more are needed. This is not time for layers to muster out—keep every honest hen on the job. Feeds are lower and eggs are higher than a year ago. Make the hens lay and keep them laying.

Kings County has adopted an ordinance quarantining influenza.

CASE ANNOUNCES
A New 3 or 4 Plow Kerosene Tractor

The Case 15-27

Pulls 3 Plows in Hard Plowing—
4 Plows Under Favorable Conditions

Here is the latest Case Tractor—offered in our 77th year of experience in the production of power-farming machinery and 27th in the production of motor tractors.

No tractor is finer. And we know of no equal.

We feel certain that this Case 15-27 will receive instant recognition among knowing farmers everywhere.

No man can afford to judge tractors of this size—nor decide which is best—until he has studied this Case 15-27.

While rated at 15 horsepower on the drawbar, this Case 15-27 can deliver more than 18 horsepower.

While rated at 27 horsepower on the belt, it can deliver about 33 horsepower.

In fields where plowing is difficult—tough or baked soil, stiff grades, etc.—this tractor pulls 3 plows easily. Where conditions are favorable this tractor can pull 4 plows.

With reasonably good footing this tractor easily delivers a pull of 3,000 pounds at the drawbar. Its reserve power makes it possible to attain 3,600 pounds pull, or over.

Under variable soil and field conditions, the operator may take advantage of the two-speed transmission, using low speed (2¼ miles per hour) for hard pulls, and high speed (3½ miles per hour) for normal draft.

Your field conditions will determine whether you should use 3 or 4 plows, or whether you should pull 3 plows on low or high gear.

A complete illustrated and descriptive catalog of all Case Kerosene Tractors will be sent gladly, upon request.

Case Superiorities

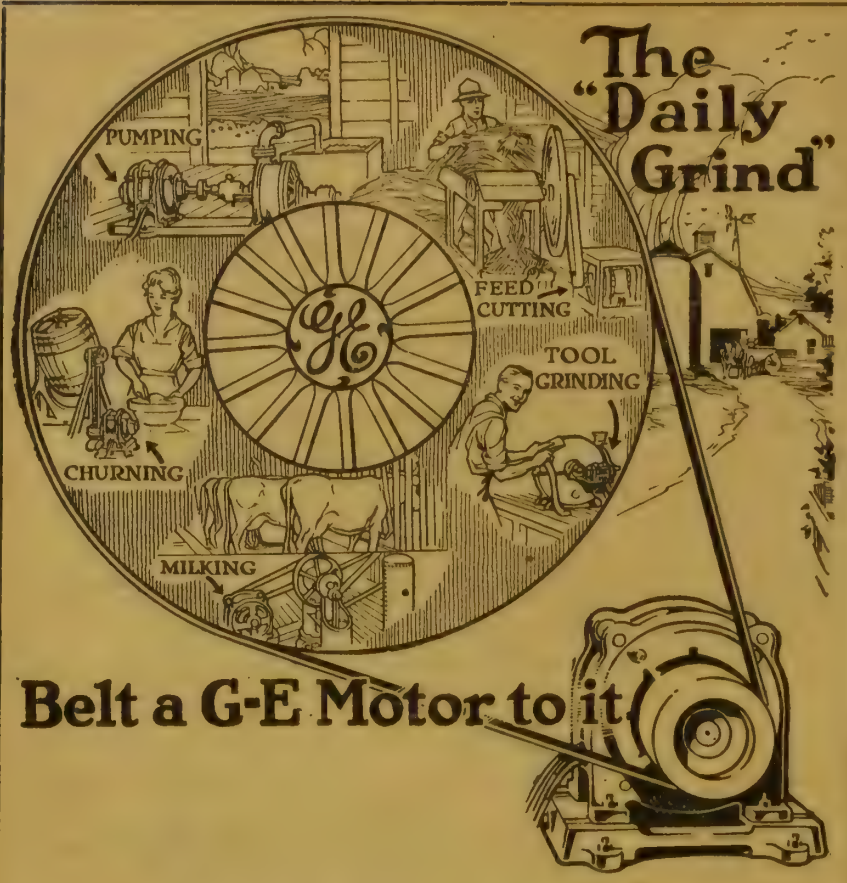
1 Weighs about 5,600 pounds. Low and compact with short wheelbase. Turning radius 13¾ ft. Stays on all fours.

2 Rated 15 horsepower on the drawbar and 27 horsepower on the belt, which is only 80 per cent of its actual capacity.

3 Four-cylinder Case valve-in-head motor. Removable head. Motor is set crosewise on frame, affording use of all spur gears. This conserves power.

4 One-piece cast main frame, forming dustproof housing for rear axle, bull pinion shaft, transmission and the bearings for these parts. Also a base for motor. This construction brings rigidity and prevents disalignment.

5 Belt pulley mounted on the engine crank shaft. No gears used to drive it. Pulley is part of the tractor, not an extra-cost accessory.



6 All traction gears are cut steel, enclosed and running in oil. No bevel gears, chain, worm or friction drive parts.

7 Case Sylphon Thermostat controls cooling system and insures complete combustion of kerosene in the motor. Prevents raw fuel from passing by pistons and diluting oil in the crank case.

8 Case air washer delivers clean air to carburetor. No grit nor dust gets into cylinders to minimize their efficiency and shorten their life.

9 All interior motor parts lubricated by a combination pump and splash system. Speed governor, fan drive and magneto are dustproof and well oiled.

10 Hyatt Roller Bearings throughout. High tension ignition. Kingston carburetor. Radiator with a cast frame. Core, copper fin and tube; non-clogging type.

Whether the job be one in the barn—milking, cutting the day's feed, pumping the water—or in the dairy—separating or churning—or wherever chores are everlastingly waiting to be done, there is a G-E Farm Motor that will do the work better and quicker. The labor released soon pays for the motor equipment.

Your near by Central Station or General Electric Agency will gladly help you.

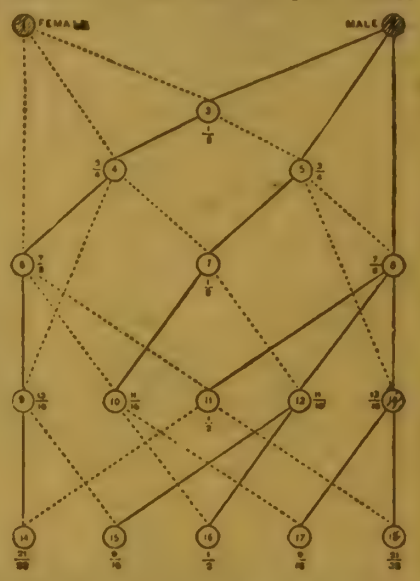
Questions and Answers



ANSWERS BY EDITOR AND STAFF

Questions to be answered in this department should be received at the office one week before reply is expected. Write plainly on one side of the paper and sign full name and address. Unsigned communications receive no attention.

Line Breeding

Please give me some information regarding line breeding in poultry. I have a two year old rooster that I would like to use.—Subscriber, National City.

Line breeding is breeding within your own flock with the purpose of establishing a strain that has the characteristics of the parent stock and should be practiced only when you have thoroughly good birds to begin with. To start such a strain you should have mated your rooster when he was a year old to the best two year old hen you could find. As you did not begin then, the next best thing would be to mate him to his best daughters. If he has no best daughters, you can mate him to an unrelated hen, but another year he may be too old to breed and so you cannot

mate him to his daughter or daughters as you should to establish a strain.

According to the Felch chart, the first mating in line breeding is that of ideal cock to ideal hen. The next year the best son of this mating is mated back to his mother and the best daughters are mated to their sire. The third year the females of the female line are mated to males of the male line and males of the female line to females of the male line. The males and females of this generation are also mated back to the original parent. In this way two blood lines are established, related, but not too closely, and hereafter the males of one are mated to the females of the other and back to their parents in such a way as to intensify the characteristics of the original pair.—J. A. K.

Pickling Meat

Please give recipe for pickling meat. —Subscriber, Fresno.

Recipes for pickling and handling all kinds of meat is too long a contract for this department. For this information see the issue of the Cultivator of January 26, 1918, in which there is an article, "Farm Curing of Meats," by W. V. Cruess, on page 113. See also Household Department next week.

Rooster Lame

Can you please tell me what is the matter with my White Minorca rooster nine months old. He went lame in one leg about four months ago. Kept getting worse, got so bad he walked on the toes of the lame leg. Now he walks on the toes of both legs with very short steps, and after eating he opens his mouth like a chick with the gapes. Otherwise he seems all right. Eats well and has a nice red comb. Has a good tight house on three sides with open front. I feed milo and scratch feed with a wet mash at noon. —Subscriber, Pasadena.

Your rooster has rheumatism, which nearly always comes from dampness in houses or yards. Your house may be all right, but your yard is too shady for cold weather. Put him in a warm, sunny place, if he is not in such a place already, and give him all the greens he will eat, making his mash more bulky by adding bran. A half teaspoon of Epsom salts in moist mash, followed the next day by baking soda in his drinking water (one teaspoon of soda to a quart of water) sometimes relieves mild cases. If the attack does not respond to treatment in a couple of weeks you might as well kill the bird. He will never be fit for breeding after four months of rheumatism.—J. A. K.

Grafting Walnuts

When is the best time to graft walnuts over? I have some that are 11 years old that I want to work over this spring. Should I cut the grafts before I use them and how long before?—Subscriber, Fillmore.

Walnuts can be grafted at any time after this until the bark begins to slip which will likely be the first week in March. The grafts may be cut at any time after the leaves fall but if cut early should be kept in damp sawdust or damp sand and in a cool place, being careful that they do not get wet enough to damage the bark, in which case they will not grow. The grafts grow equally well, if carefully kept, whether they have been cut a few weeks or whether they are taken from the tree and inserted at once.—J. B. N.

Rabbits' Sore Feet and Ears

What cure is there for rabbits with sore feet and ears?—Subscriber, El Cajon.

Sore hocks and ear canker are often found today. Would advise that the animal with sore hocks be put in hutch with ground floor. Put some straw in one end on which has been sprinkled a weak solution of any good disinfectant. Sores may be washed with hydrogen peroxide daily. Feed a variety of green food and barks of trees along with the alfalfa hay and rolled barley. Use these sparingly as tonics and not as regular feeds, except in the case of carrots, which may be given as part of one feed daily. One tablespoon of sulphur in a vaseline jar of olive oil makes good medicine for ear canker. Use brush or dropper, putting in the affected ear twice a week till cured. One or two times is usually sufficient. Clean hutches thoroughly where these animals have been before using for other animals as diseases are contagious.—W. D. W.

Time to Wean Rabbits

Kindly tell me through the Cultivator at what age I should separate my young rabbits from their mother. At what age does she wean them and when should she be bred again?—Subscriber, Nipomo.

The time of weaning depends upon conditions of young and mother; it is generally six to eight weeks of age. Separate young a few at a time if litter is large, as to take them all away at once might affect doe's breasts. Separate sexes at three to three and a half months of age. Does can be kept together till bred, but bucks should be separated at five months of age. Generally a doe can be bred when young are six weeks old, but if run down from nursing the litter would suggest giving her two weeks or more of rest and special feeding. Ofttimes a doe does not have sufficient nurse. This can be ascertained by noting condition of breasts and milk canals and condition of young. Would advise obtaining a good rabbit book and a fuller study therefrom of the subjects of breeding and feeding.—W. D. W.

SILENCE

In the mystery of the morning,
Of the hour before the dawn,
Comes a peace upon my spirit,
And within my soul are born
Thoughts of love and gentle kindness,
That throughout the day abide,
Till the evening sun is setting
In a glorious crimson tide.

For 'tis then the ever-present
And the all-surrounding good
Seems to bathe my soul in gladness
And to enter every mood;
And there comes the strength of angels
Throbbing through this heart of mine,
And I know the power within me
Is of God, and is divine.
—(Author unknown.)

LEARNING TO KNIT

Written for California Cultivator
By L. W. McNeil

MARGARET EARL was learning to knit. It was slow work, for her chubby, eight year old fingers were clumsy, and stitches would come off the needle, and there was disaster and much ripping out of the wash cloth she was doing. Indeed, it had been ripped so often that the white cotton was becoming soiled and dark, but she kept at it bravely, for was it not for the soldiers she was doing this? Her own grandfather had fought in the Civil War, and other grandfathers farther back in the line in other wars, so was it not her right to help in this last great war which was taking the boys from all over the country and sending them away over the ocean to fight for the little girls and babies there? So the patient fingers toiled and the tired eyes did not falter as she tried to manage the needles and to keep the stitches in place; but a tired sigh would come sometimes.

Only grandmother, busily knitting on a gray sock by the sunny window, heard the sighs and saw the weariness in the little face.

"Is it any easier now, Dear " she asked as Margaret paused in her work to look at the result.

"Yes'm. I think it is, some; but it is not very smooth, and holes just come somehow. Yours is so smooth and nice, Grandmother. How can you make it so? You do not seem to look at it much but it comes just as smooth. How do you do it?"

Grandmother smiled at the little girl softly.

"It is the doing of it over and over, child, that makes it easy," she answered. "I began when I was as small as you to do a garter stitch. By patiently trying I learned to make it smooth. I have knit many pairs of socks and mittens since I was young as you. When I was your age I knitted my own stockings. Mother helped with the shaping of them, but I did most of the knitting. When I was ten years old I knit socks to sell to buy calico for myself a dress. It was pink, I remember, and I thought very pretty. When my mother brought it home I was glad. I forgot the long hours I had knit when the flowers and grass and summer breezes were calling me out to play.

"Then mother cut out my new dress and said I was old enough to learn to sew, so I made my new pink dress all myself except the button holes."

"Why, grandmother! A little girl ten years old make a dress all by herself!" exclaimed Margaret.

"Yes, Margaret," answered her grandmother. "Girls were taught to work very young then. All the family had to help. We were poor, in a new country, and there was much to do, clearing away the forest and getting the land ready for crops, and all the clothes for everybody were made at home. My mother spun and wove and made my father's clothes as well as hers and mine and Brother Sam's. There were sheets and towels and all the other linen to be spun and woven. A girl ten years old must work too."

Margaret looked at her grandmother, at the soft white hair, at her face so full of wrinkles, but so pleasant and good to see. Grandmother was very old. What a long time since she was ten!

"It took you a long time to make it, didn't it?" she asked. "How could you ever do it?"

"Just a stitch at a time," answered grandmother. In a week it was done, every stitch by hand, for there were no sewing machines then to make it go fast."

Margaret sighed and took up her forgotten knitting.

"And I've been a whole week knitting and ripping this out. The cotton is nearly worn out. You made your dress a stitch at a time, grandmother, and that is the way I must learn to do this knitting, isn't it?"

"That is the only way to learn to do anything," said grandmother; "a stitch at a time; a little today and a little tomorrow, and by and by you know how and can do a thing easily. Keep on trying. Bring your knitting here and let me see it."

Margaret came and laid it in her lap.

"You must be careful of every stitch; take them off the needle just alike. If you take one off by slipping the needle through the front thread and the next under the back thread that will make a hole or a rough place. Do them all just alike by putting the needle under the front thread and hold the cotton just tight enough; neither too loose nor too tight, and you can soon do it well."

Margaret sighed. "Did you always like to do things right, grandmother?" she asked.

"Like all little girls I got tired and wanted to play, but I had the work to do and soon found that the best way was to do it well."

"Did you ever do anything but work?" asked Margaret.

"Why, yes, Dear, I used to go berrying up on old Pumpkin' Vine in the summer, sliding on the ice in the winter, and into the sugarbush with my father in sugar time. I loved that. I loved to sit before the big fire and hear the sap boil and watch the color of the coals in the fire. Sometimes I dug among the snow and found the Christmas ferns and played it was summer time. I gathered the mosses off the trunks of the trees and tried to see how many different kinds I could get. And then there were fairy palaces and caves in the snow which were beautiful to see. The birds came around in the trees, the woodpeckers and snow birds and nuthatches, and sometimes the crows would caw and make the woods ring with their noise. Then we would ride home on the sled with old Bet drawing us, and have hot biscuits or johnnycake and maple syrup for supper."

"How perfectly delicious that must have been," said Margaret, "as much maple syrup as you could eat? My!" and she drew a long breath.

"Yes, Dear, there were pleasant times along with the work then," and Grandmother sighed as she thought back through the years since she was a little girl.

Margaret knit in silence for a time, then she said: "I believe this is going nicer since I sit by you and listen to you tell about when you were a little girl like me. See, Grandmother?" and she held out her work.

"That is much better; you are really learning the way to do it. It will not be so hard any more."

There were several rows across the cloth, all straight, with no holes or dropped stitches.

"I am going to sit by you all the time after this when I knit," she said. "Will you tell me about what you did long ago every time we knit?"

"I will tell you all I can to help you, Child," every day," Grandmother said.

"You said something about Pumpkin Vine hill. What is the story about that?" said Margaret.

"I will tell you that another time. It is nearly dinner time and you had better go and help mother. Tell her that you can do better with your knitting this morning."

Margaret laughed happily as she laid away her knitting and went into the kitchen.

A NEW SWEATER FROM AN OLD ONE

Written for California Cultivator
By Ruth Bullock

As the fall and colder days came, I wanted a sweater, but having a good coat did not feel justified in purchasing a nonessential garment.

Found an old sweater, relic of college days, not badly faded and made from good wool, but now rather short, too tight and finished with an old fashioned collar.

With some time and more patience, and one and a half skeins of new yarn I have an attractive blue sweater with white collar, cuffs and belt and crocheted buttons with loops for fastenings.

How? An inch hem at the bottom was let down and the stitches carefully picked up. The old collar raveled supplied enough yarn to add one and one-half inches to the original length.

The front hems ripped out made two inches extra in the bust measure (fortunately they were loops instead of buttonholes).

The cuffs were raveled out half their length and bound off.

The neck of the sweater was bound off and the shape of the collar, obtained from a paper pattern, was knit the desired shape.

The belt is three inches wide and fastened on the left side with three crocheted buttons and loops; three companion buttons are fastened on the right side—not directly under the arm but a little to the front so the buttons will not be so quickly soiled by constant rubbing of the arms.

As both the collar and cuffs are bound off it will be an easy matter to launder them and replace on the sweater.

Around the edges of the collar, cuffs and belt is a crocheted slip stitch which gives a firm edge. Tapes across the back, on the shoulder and under arm seams, aid greatly in retaining the normal shape of the sweater by not allowing it to stretch.

The white yarn cost $2.10 and sweaters I recently saw in the Los Angeles stores, priced at $15, were not nearly so attractive.

HOW AN OLD COAT WAS MODERNIZED

Written for California Cultivator
By Mrs. S. W. Bullock

The cloth was of good material, double faced, blue on the right side, blue and brown plaid on the wrong side.

Originally, two small blue pockets with plaid flaps were on the outside, but no belt was on the coat. The front facings were four inches wide, forming plaid lapels.

Removing the lefthand side of facing to the plaid lapel, gave a strip 30 inches long; while that from the right-hand or buttonhole side was only a 20 inch piece.

From these strips was obtained a 37 inch belt. This left a piece with which to enlarge both pockets; the blue pockets turned plaid side out, the piecing, owing to the plaids, did not show. The former plaid pocket flaps, turned blue side out, not being large enough for the wider pockets the space was filled by two buttons which were removed from the cuffs.

The linen taped raw edges on the front of the coat were underfaced by wide dress braid neatly hemmed down.

The larger sized plaid pockets and the belt put a stylish finish to an old coat, and gave me the wherewithal for two installments of a Liberty Bond.

TRULY IRISH

A North of Ireland man wanted to send a telegram to a friend in a remote part of the island. The clerk told him the charge would be one shilling and sixpence.

"How do you make that out?"

"Sixpence for the wire and a shilling for delivery outside the radius."

"That be hanged!" retorted the Irishman. "You send the telegram and I'll write and ask him to call for it."

The Cultivator Patterns

8817—Ladies' Waist. Cut in sizes 34, 36, 38, 40 and 42 inches bust measure. The waist is to be slipped on over the head; the sleeves may be made full length or three-quarter.

8403—Ladies' Waist. Cut in sizes 36, 38, 40 and 42 inches bust measure. The collar is hemstitched and the fichu is gathered to it at the shoulders.

8596—Children's One Piece Dress. Cut in sizes 4, 6, 8, 10 and 12 years. The dress hangs straight from the yoke, but a belt of contrasting material holds the fulness in place.

8842—Ladies' Blouse. Cut in sizes 36, 38, 40 and 42 inches bust measure. The upper section extends below the waistline, and the line of joining is curved high at front and back.

8582—Ladies' Bungalow Apron. Cut in sizes 36, 40 and 44 inches bust measure. The apron buttons down the center back, and a narrow belt holds in the fulness at the waistline.

8827—Boys' Overalls. Cut in sizes 2, 4, 6, 8, 10, 12, 14 and 16 years. The overalls have a seam at center front and the opening is at the sides.

8409—Ladies' Two Piece Skirt. Cut in sizes 24, 26, 28, 30 and 32 inches waist measure. The skirt has two gores and they are gathered to the slightly raised waistline.

PRICE OF ANY OF THE ABOVE PATTERNS 10 CENTS EACH.

HOW TO ORDER PATTERNS

Write your name and address plainly in full, give correct number and size of each pattern you want, and send 10 cents in coin or (1 or 2 cent) stamps for each number. In order to furnish our readers with the very latest New York City styles, all pattern orders are filled in New York City. Therefore, we promise to deliver all patterns ordered within two weeks; we guarantee safe delivery of all patterns. Address

The Profits of Pear-Growing

are so great that this is possibly the most attractive branch of orcharding.

The one great drawback is BLIGHT—a danger impossible to over-exaggerate, yet always discounted by the grower until he learns wisdom by sad experience.

Not yet generally destructive in Southern California, IT IS AS SURE TO COME as death and taxes, since the highest authorities agree that no pear district in California is PERMANENTLY blight-free.

Progressive planters will safeguard their orchards so far as is humanly possible by planting ONLY

Blight-Resistant

trees. These do not eliminate all possibility of damage, but bring the danger down to the irreducible minimum.

Pears budded on Jap roots are in great measure immune to blight in the underground parts of the tree. A greater degree of protection can be had by use of the new, practically-blight-proof, Chinese seedling,

Usuriensis

planting this in orchard rows, heading it to suit your preference, and budding in the branches to Bartlett or other desired variety. Every part below the bud will be positively blight-proof.

We have magnificent trees on the Jap root—trees with superb roots, rarely equalled and never excelled in quality—and can also supply genuine Usuriensis seedlings, having the only stock in America this year outside the experiment stations.

Beside Bartlett on Jap, we have on the same root some splendid Anjou, Comice, and Winter Nellis—varieties much more resistant to blight than Bartlett. These sell for top prices in the Eastern fruit auctions, and by cross pollination make Bartletts much more fruitful—in our orchard as much as 700 per cent increase.

Apple Trees

of the profit-making varieties—Delicious, King David, Rome Beauty, Jonathan, Spitzenberg—trees with the best and biggest root system that ever left a nursery—the kind every grower pronounces perfect.

Use our trees for your orchard foundation and you will have success if you do your part, because

PERSIMMONS IN COOKING

Is there anything better than a persimmon, ripe, rich and luscious? Still, if you ever bit a green one—!

To be on the safe side in cooking it is well to add a half teaspoon of baking soda to each cup of persimmon pulp whenever the fruit is subjected to heat. This does away with all risk of astringency. If the fruit is perfectly ripe this precaution is not necessary, but as there is always the possibility of some green fruit finding its way into the pulp it is usually advisable.

The following recipes will be found simple and agreeable:

Persimon Bread

One cup of persimmon pulp, one cup of water, one-half teaspoon of soda, yeast, shortening, flour to make a stiff dough. Set to rise, mold, and bake like other bread.

Persimmon Crumpets

Take one pint of the sponge of persimmon bread which has been set over night, add one egg and enough milk to make a thin batter, set to rise for one hour, then bake on a hot griddle like griddlecakes. Serve hot with butter or syrup.

Persimmon Griddlecakes

One cup of persimmon pulp, one egg, One cup of flour, one teaspoon of baking powder, one-half teaspoon of soda, milk to make a thin batter. Bake and serve as above.

Persimmon Cake

One cup of persimmon pulp, one-half cup of sugar, one egg, one cup of flour, one teaspoon of baking powder, one-half teaspoon of soda.

Butter of size of a walnut. Bake 40 minutes in a moderate oven. For a soft pudding leave out the eggs. For a custard pudding leave out the flour and the baking powder.

Preserved Whole Persimmons

Put a thin layer of sugar in the bottom of a jar; then a layer of whole ripe persimmons, then a layer of sugar, and so on until the jar is full. The sugar will soon dissolve and form a syrup. Press the upper fruits down under the syrup or add more syrup to the jars. Seal and store until used. The syrup may be drained off and the fruits served like dates, which they will resemble very much in both appearance and flavor.

Persimmon Ice Cream

Two cups of persimmon pulp, one cup of thick, sweet cream. Beat together thoroughly and freeze like ordinary ice cream. The fruit must be thoroughly ripe and nonastringent.

Persimmon Fudge

Two cups of persimmon pulp, two cups of sugar. Cook over a slow fire, stirring occasionally, until graining begins. Add one teaspoon of baking soda and stir over the fire until quite stiff. Spread on buttered platter or paraffin paper.

AN UNFORTUNATE TEXT

The widower had just taken his fourth wife and was showing her around the village. Among the places visited was the churchyard, and the bride paused before a very elaborate tombstone that had been erected by the bridegroom. Being a little nearsighted, she asked him to read the inscriptions, and in reverent tones he read:

"Here lies Susan, beloved wife of John Smith, and Jane, beloved wife of John Smith, and Mary, beloved wife of John Smith."

He paused abruptly and the bride leaning forward to see the bottom line, read to her horror:

"Be Ye Also Ready."—From Norman E. Mack's National Monthly.

WHEN THE LID IS OFF

"I tell you, Bill, when you take a wife, you just go it blind, as the sayin' is."

"Sure thing! As the wise guy remarked, you never know whether you married a peach or a lemon until the first family jar is opened."

EXTREMES MEETING

"My wife just hands me her bills."

"What do you do about it?"

"Oh, I just foot them."

For a Fruitful Crop—

See that your dormant spraying is done properly. Remember—it takes a long time to grow your crop. A little care now will mean better fruit and bigger profits. Right now you need a general clean-up spray that will not only kill the insects but will tone up your trees. In other words, you need—

Crude Oil Emulsion

No matter what Universal Spray you order you can be sure that it is dependable—uniform in quality—and made under the direction of trained laboratory and field men.

Here are some of the other sprays manufactured or distributed by us: Dormant Soluble Oil; Lime Sulphur Solution; Bordeaux Mixture; Arsenate of Lead; "Triumph" for Citrus Trees; Miscible Oil No. 1 for Olives; Miscible Oil No. 2 for Thrips.

Don't hesitate to write our Service Department—in charge of Paul R. Jones, Entomologist—for expert advice. This service costs you nothing.

Ducks, 30; ducklings, 32; geese, 28; turkeys, 34@35; squabs, 40-43; Belgian hares, 20.

LIVESTOCK

Due to the scarcity of range steers and cows the market for live cattle is gaining strength almost daily.
The demand for all grades of steers has improved and will further improve owing to the scarcity of good cows. Local killers are compelled to slaughter more steers to keep their plants running than they have for several months previous. In former weeks the kill of cows was larger than that of steers but the reverse is now the case.
The hog market is on a firm basis and hogs properly finished are bringing record prices for killing grades. There is every indication that the market will continue good for some time to come.
The future of the sheep and lamb market is not as rosy as are cattle and hog. Wool prices are expected to start on a toboggan downward at a rapid clip since government orders for wool have been discontinued and clothing manufacturers are clamoring for cheaper wool to start their plants and place returning soldiers in employment. Local killers seem to be able to secure their requirements at prices about steady with last week. Wethers are very scarce and command firm prices. Ewes are plentiful but demand for them is very light.
Report of live stock conditions on the Los Angeles market as compiled by the United States Department of Agriculture, Bureau of Markets, through the local office. The following are live stock prices on the Los Angeles market f. o. b. packers' yards. Prices at country points are $1.00 to $1.50 per cwt. less than these quoted:
Good Steers .....13.00@14.00
Common .....11.50@12.00
Good Cows .....10.50@11.00
Medium Cows .....8.00@9.00
Common and canners .....6.00@7.00
Prices quoted below are for carload shipments f. o. b. slaughterers' pens. Driven-in, or truck hogs sell for ½ cent less.
Hogs—
No. 1 hogs, 150-225 lbs. .....17.00@18.00
No. 2 hogs, 250-350 lbs. .....16.00@16.50
Sheep—
Lambs, 65-80 lbs. .....15.50@16.00
Wethers .....11.00@12.00
Ewes .....8.50@10.50

Choice Tame Oat Hay .....21.00@23.50
Other Tame Oat Hay .....16.00@19.00
Wild Oat Hay .....16.00@18.00
Barley Hay .....16.00@18.00
Alfalfa .....18.00@22.00
Stock Hay, in order .....14.00@17.00
No. 1 Barley straw, bale .....50@80
Damaged hay, all kinds, according to condition.

SEEDS

Flax .....8@8½
Millet .....5@5½
Rape .....2½@5

Citrus Fruit Market

Los Angeles, January 8, 1919.

Practically all picking has stopped until time for determining extent of frost injury. This will probably be about the 16th. Quantity of fruit in packing house picked before the frost is still going forward. A few growers are not observing the request to cease picking entirely. Fruit still offered in market is commanding fair price.

Lemons in some sections injured by cold weather so that mid-summer to fall delivery will probably be very light. Market conditions at present vary slightly.

Shipments

Shipments of citrus fruits to date since November 1, 1918: Southern California; oranges 2286 cars, lemons 1209, total 3495. To same date last season; oranges 2226, lemons 564, total 2790. Central California this season; oranges 2798, lemons 257, total 3055. Last season to same date; oranges 1764, lemons 76, total 1840. Northern California; oranges 224, last year same date, 197.

AT THE AUCTIONS

January 2

New York: Navels 2.65-5.95, lem. 2.85-3.75.

Boston: 10 cars. Nav. 4.15-5.75.

Philadelphia: 4 cars. Nav. 3.25-5.05, lem. 2.75-4.10.

January 7

New York: 9 oranges, 2 lem. Nav. 3.65-5.35.

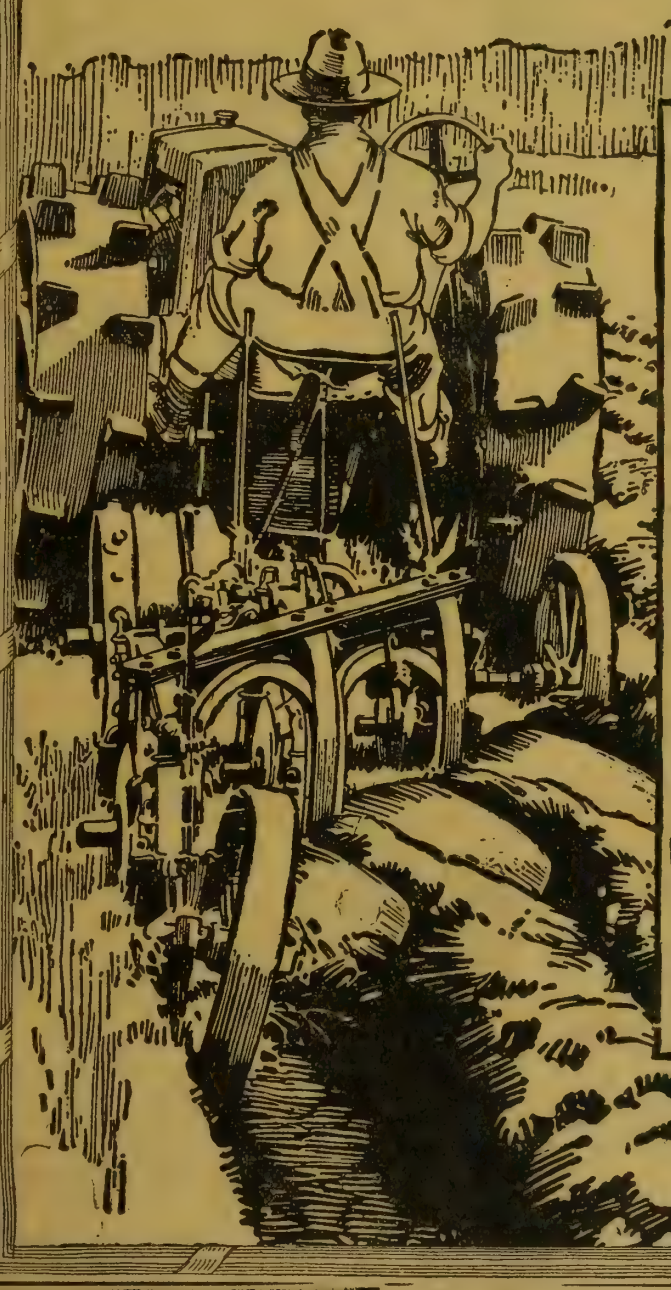
Philadelphia: 2 oranges, 2 lem. Nav. 4.35-5.40, lem. 3.60-4.60.

Boston: 7 oranges, 2 lem. Nav. 3.55-6.05, lem. 3.10-4.35.

PARTIAL LIST CALIFORNIA FRUIT AND VEGETABLE SHIPMENTS

From post card reports to the Los Angeles branch of the bureau of markets, report is made of the following shipment of cars of products from California for the week ending January 6: Apples, 58; cabbage, 16; carrots, 14; cauliflower, 34; celery, 54; dried apples, 3; dried apricots, 2; dried beans, 75; dried figs, 3; dried peaches, 12; dried peppers, 1; dried prunes, 33; lettuce, 29; mixed vegetables, 45; mixed fruit and vegetables, 15; mixed dried fruit, 21; olives, 2; onions, 15; potatoes, 131; raisins, 204; spinach, 4; sweet potatoes, 6; Arizona potatoes, 1; Nevada potatoes, 4.

ORANGE MARMALADE



Continued from Page 43

at $15 per ton, the cost of the fruit per quart can will be about two cents. It should be possible to sell this material retail at not more than 200 per cent of the cost to manufacture. This would bring its cost to the housewife not much above 12½ cents per quart. From each quart she will be able to make above seven or eight four-ounce glasses of marmalade or jelly. The use of these products by the housewife will make it possible for her to be always certain of her results. She will always get a fine flavored marmalade or jelly of good jelly-like consistency. She will be spared the trouble and labor of slicing or boiling the fruit. In the writer's estimation, these products may be marketed under an association label and would in time have a very wide market. It is suggested that the large canneries of Southern California seriously consider the possibilities in these products. The equipment necessary is not very expensive and it would be possible for many packing houses to install the necessary machinery to produce the canned material at the packing house. However, it would probably be more advantageous to transfer the fruit to canneries or other established factories.

Grape fruit may be substituted in whole or in part for oranges.

By the use of presses and filter presses the yields can be increased and the labor costs reduced.

J.I.CASE PLOWS

No "Drag"

THE J. I. Case Tractor Plow is one example of J. I. Case skill. This plow is famous for extreme light draft. The "drag" of furrow bottom and land side pressure have been eliminated. Besides, J. I. Case dust-proof, easy lubricating, long-distance wheels carry all the weight of the frame.

That's why this plow "rides" like any wheeled vehicle, instead of dragging like a stone boat. Easily handled from the tractor seat; has a simple, sturdy power lift and enters and leaves the ground instantly, point first, like a walking plow.

This J. I. Case plow makes the tractor a better investment because more acres can be plowed per day with a minimum of fuel, labor and repair expense.

See your J. I. Case dealer. He is usually the best dealer in each town. If you don't know his name, write us.

GOOD FARMING PAYS

Protect your crops against drought by using the Western Pulverizer, Packer and Mulcher for preparing your seed bed and keeping a moisture-retaining mulch on your growing grain.

The Western pulverizes, packs, mulches and makes a perfect seed bed in one operation, saves time, horse power and one-third seed, still producing a better stand. Seed will start at once when seeded. Especially adapted for breaking crust on growing grain, will break the hardest crust, forming it into a moisture-retaining mulch without injuring growing grain and will raise a crop with half the moisture during growing season.

MADE IN 12 SIZES, 1 AND 3 SECTIONS FOR HORSES AND TRACTORS

This year's crop will bring high prices; make it a record breaker by using the Western. Free illustrated catalog describing machine and its principle, shows its work by pictures taken in the field, gives nearest shipping point to you, contains valuable information on up-to-date farming. Worth its weight in gold to farmers and land owners. Send for it today.

Western Land Roller Co., Box 400 Hastings, Neb.

Smilo Grass

For Ranges and Non-Irrigated Land

A forage plant especially suitable for hills and barren spots to increase the grazing value of the range. Will grow on semi-desert land or on dry hills among rocks and brush where no other grass will grow. Once established it seeds itself down and spreads rapidly.

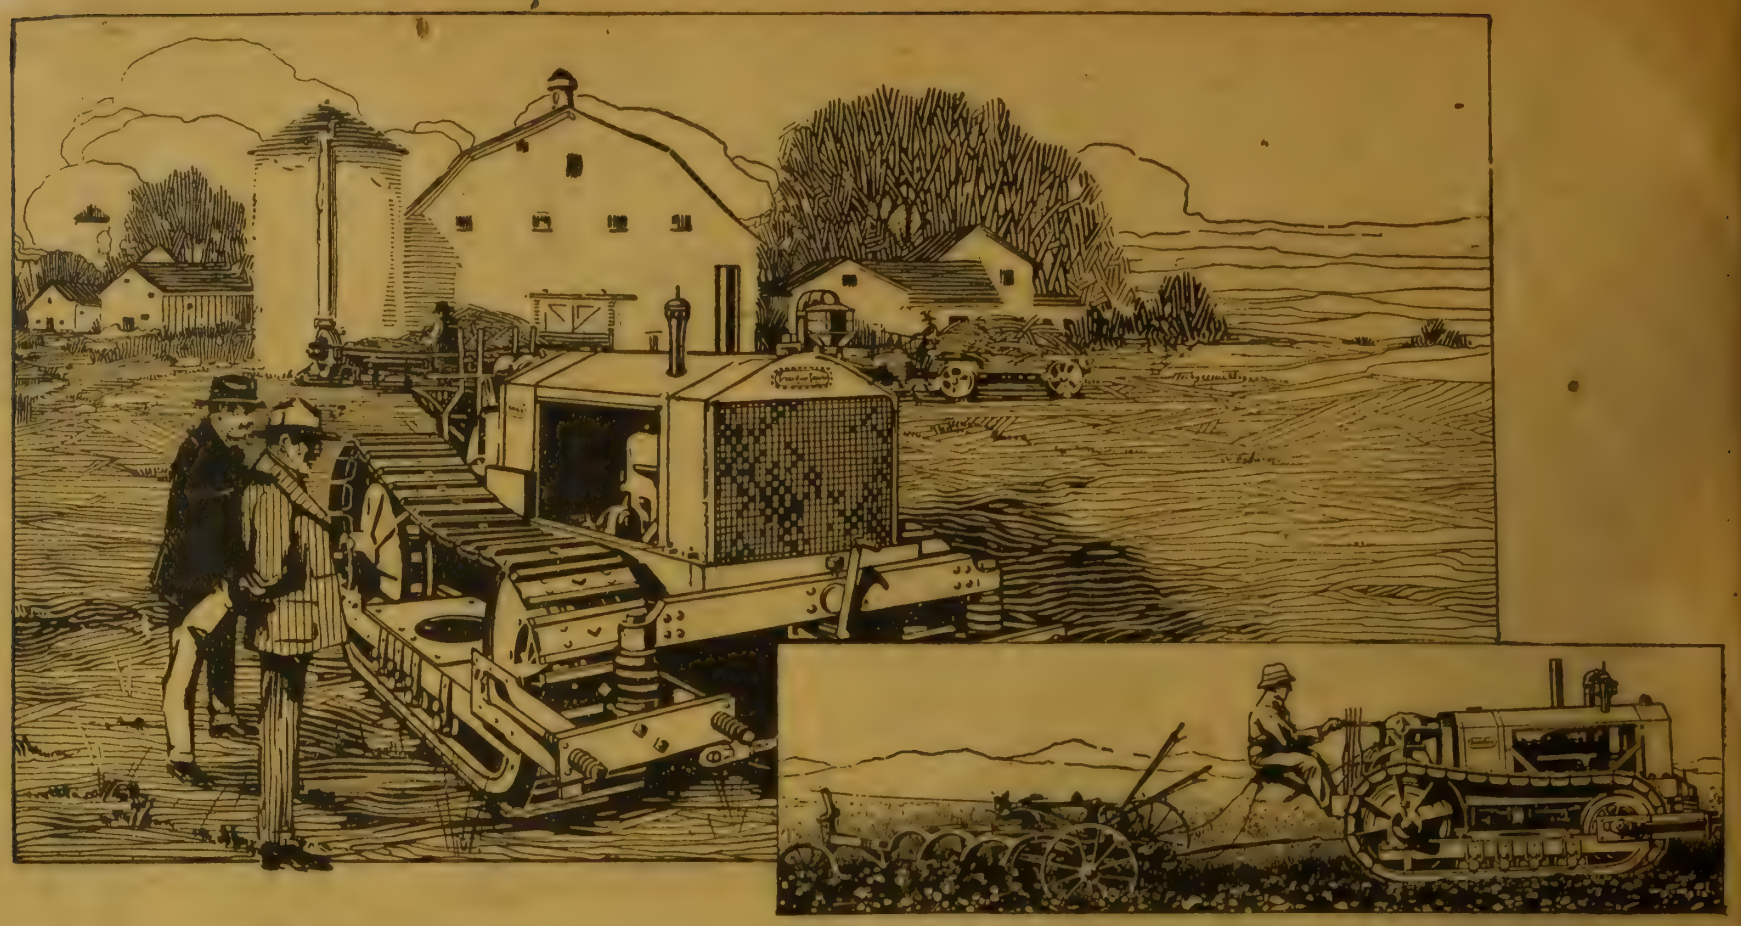
Smilo Grass is a hardy perennial bunch grass, greatly relished by stock. Is not an experiment but a proven forage plant endorsed by leading stockmen and recommended by the University of California. Sow one-quarter pound per acre. Price 50 cents ounce, $1.00 quarter pound, $3.00 pound.

Harris Seed Co.

909 Sixth St. San Diego, Cal.

BUNT'S

RODENT EXTERMINATOR



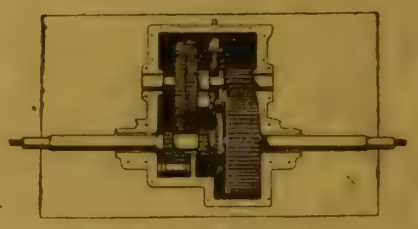
Spend 1½ cents, kill one squirrel, and save $1.00 worth of grain.

Bunt's Rodent Exterminator kills; non-explosive; no rancher can afford to feed squirrels.

Box 150 exterminators.....$ 3.00
Case 900 exterminators..... 13.50

Calif. Chemical Co.

340 Sansome St., San Francisco

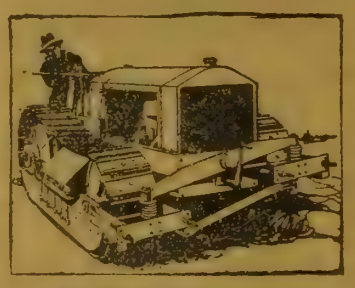


How to judge a tractor

PERFORMANCES, rather than promises, are the most satisfactory ways to judge a tractor. Judged by performances, Trundaar Tractors have given universal satisfaction to all who operate them. Every owner reports complete satisfaction with the Trundaar's plow-pulling ability, stationary work, economy and excess power. The one feature which more than any other has occasioned favorable comment is the absolute reliability of the Trundaar. When it is wanted for service it is ready. It is not laid up for repairs just when it is most needed.

With a tractor the idle days are the costly days and the Trundaar has no idle days.

Why there are no interruptions



The biggest source of interruption on most tractors is the tread. The common practice of lubricating the tread of a tractor causes the mixture of dust and oil to work into the bearings, causing rapid wear. The Trundaar tread is built on the old log-chain principle and requires absolutely no lubrication. If a link or grouser plate on the Trundaar tread does break, it can be replaced in fifteen minutes by the removal of the four bolts. This eliminates costly interruptions in the busy season and decreases the repair bill considerably.

The massive Trundaar transmission requires no differential,

A powerful drive clutch running in oil does away with the need of gear and pinion drive

The flexible suspension keeps the tread on the ground in the most uneven going

An engine built for heavy work

The engine of a tractor is subjected to particularly strenuous work. It runs at full speed most of the time. It is subjected to bumps, shocks and exposure to clouds of dust. The Buckeye-Waukesha engine is built specially for the Trundaar Tractor. It is powerful and strong, and may be relied upon to give steady-running, dependable power.

Carl Scheneke of Vacaville, California, says:

> "We are pulling eight 10-inch bottom plows in adobe land to a depth of an average of six inches deep. The tractor is handling this load with no trouble so far as power is concerned as the motor never heats in the least."

The massive transmission, the special three-point suspension, the multiple disc clutch and all other parts of the Trundaar are built with the main idea of giving dependable service under the most difficult work.

If you are farming 200 or more acres, you should have complete information about what the Trundaar has done for others, and will do for you.

Write today for record of service and complete information about the special mechanical features of the Trundaar.

OUR ADVERTISERS RELIABLE

We guarantee our subscribers against loss through dishonesty of any advertisers in the Cultivator. We do not attempt, however, to adjust trifling differences between subscribers and honest, responsible advertisers, nor will we pay the debts of honest bankrupts. Notice of complaint must be sent us within 30 days from date of the transaction, and the subscriber must have mentioned the Cultivator when writing the advertiser.

THIS WEEK'S COVER

One of California's wealth making crops and one which affords food for man and beast is shown on our cover. The sorghum grains have proven good producers under trying conditions in the arid Southwest. In this state milo, feterita, dura, or "Egyptian corn," all do well, but the long favorite is milo, a field of which is shown in the illustration. This field is on the place of J. C. Sharp near El Centro, and interesting items as to cultural directions may be found on Page 76.

W. S. S.

We may still buy war savings stamps, and thrift stamps left over from 1918 are still good in payment. The new 1919 stamps, however, are different from last year's and do not mature until 1924.

There is special need for the fund which comes from these stamps, and everyone who can should still purchase. They start at the same price carried by the stamps of the previous issue, that is $4.12 in January, the price being advanced one cent each month until December 31.

SAN FRANCISCO SHOW OFF

The California International Live Stock Show, originally planned to be held at San Francisco last fall and postponed until early in February, has been definitely called off.

This decision was announced last week following a meeting of the board of directors who felt that the influenza situation was such that it would be inadvisable to attempt a spring show.

No new date has been announced, but the show will probably be held next fall.

MAKE MARMALADE

Prof. Cruess gave last week to Cultivator readers plain instructions in the home making of marmalade from cirus fruits. There will be a vast quantity of citrus fruits which will be waste unless they are used in the making of jellies and marmalades or some similar product. Fortunately California is saving a vast quantity of waste product in marmalade and jelly. Factories are being established in various citrus sections. We visited one a few days ago at San Dimas where thousands of pounds of citrus fruits, practically worthless even to sell in the market as culls, are being made into a high class product, put up in glass jars with most attractive lithographed labels.

There is one unfortunate feature of this method of disposal of waste fruit, and that is that it takes a large quantity of sugar, in fact, more than 50 per cent of the finished product is sugar. Notwithstanding this it is hoped the product can be marketed so as to make return to the grower of at least two cents per pound for his cull oranges.

ARMENIAN WEEK

This is Armenia's week. America is raising $30,000,000 in the effort to save the remnant of people left of four millions of Armenians and a large number of Syrians who are being starved by conditions brought about by war or, more particularly, by the cruelty of Turkey. England has been more in touch with these people because of the nearness of her troops, and she has, with the American Red Cross, carried this burden for months. The Red Cross is unable to enter Armenia as an organization, but it is understood it has supplied food to these people to the extent of a quarter of a million dollars a month. This has been distributed through the Armenian relief committee. The American campaign has been largely taken up by the churches of the country and they are hoping to make good every penny of the $30,000,000 requested. California gets the privilege of paying something over $1,000,000.

WHEAT GUARANTEE

Some wheat growers have questioned as to whether the government pledge of the maintenance of wheat prices for all the 1919 crop will be made good. This not because of any intimation on the part of the government, but because some who are not wheat producers question as to whether the farmer should be singled out for such a favor. To which the wheat grower replies that the "favor" of this guarantee when first established reduced the price from $3.50 which it was commanding on the open market, to less than $2.00. We say, "to less than $2.00," for grades and differentials as established resulted in few farmers receiving $2.00. It is said the treasury officials fear the loss to the government in making good wheat pledges. If made good, this may aggregate a half a billion dollars. Even if it does, it is hardly probable this amount will make good the loss which was visited on the farmers by the original price making.

One point which complicates the wheat situation is the fact that both England and France are cancelling some of their food purchasing contracts. But there are other consumers, and as fast as transportation problems are solved it is to be hoped a great quantity of American food may be put where it will stop some of the suffering which prevails the world over at this moment.

MORE EGGS

We presume there will be more eggs produced during 1919 than during any other year in the history of the country. Notwithstanding the almost prohibitive prices of feeds, poultrymen have twisted and turned and as a rule have made some money because of the exceptionally high price of eggs and of poultry. Every hatchery is running incubators to full capacity, and it now appears that great numbers of pullets will begin laying early next fall. However, we presume this campaign is not so general in the East as it is in California. The best thing about poultry prosperity is that it is so generally distributed.

At the recent farm center meeting, or rather city farm center at Los Angeles, Farm Adviser Coit referred to the great profit of the poultry industry when carried on by the orchardist as coming from the fertility adedd to the soil. Dr. Coit has made careful observations in the matter of fertilizing citrus orchards and has found that quickest and most emphatic return from fertilization comes from the use of poultry manure. In fact, it is asserted that this manure contains at least three, and possibly four, times as much fertility as the average stable manure. If this be true, the citrus grower can well afford to keep poultry which will board itself and supply this fertility.

PURE FEED LAW

THE combined live stock and poultry interests in California have agreed upon a form of pure feed law that has been submitted to the legislature and strenuous efforts will be made to see that it passes both houses and is signed by Governor Stephens, who gave a similar measure the pocket veto last session. This bill was agreed upon at a meeting held in San Francisco last week called by the California Swine Breeders' Association and made up of representatives of the dairy, beef cattle, poultry, sheep and rabbit interests.

The meeting was called by Vice President Alec D. McCarty of the Swine Breeders' Association as President C. B. Cunningham was suddenly taken ill on the morning of the meeting. Professor E. J. Lea, director of the bureau of foods and drugs of the state board of health, outlined the proposed bill which was discussed from every angle and in some instances amendments were proposed by the stock men. The bill defines commercial feed stuffs as including all feeds for feeding live stock and poultry except whole seeds or grains and the unmixed meals made directly from and consisting of the entire grains of corn, wheat, rye, barley, oats, buckwheat, flaxseed, kaffir and milo and whole hays, straws, cottonseed hulls and corn stover, when unmixed with other materials, and all materials containing 60 per cent or more of water.

On all such feeds other than the above stated the following rule must apply: That the manufacturer label the container with the net weight of the contents; the name, brand or trade mark; the name and principal address of the manufacturer or person responsible for placing the commodity on the market; the minimum per cent of crude protein; the minimum per cent of crude fat; the maximum per cent of crude fibre; the specific name of each ingredient used in its manufacture and their proportion.

The law shall be enforced by the pure food inspectors of the state board of health, which makes it more easy to obtain a successful passage of the bill as it does not create any new state jobs to be frowned upon by the legislators. So that the law will not be looked upon too lightly a good strong penalty has been attached, consisting of a fine of not more than $100 for the first violation and not less than $100 for each subsequent violation. In addition to the labeling of the contents, the law also provides that it is a violation to mix or adulterate any feed stuffs with any substitutes injurious to the health of live stock or poultry. Any such feed stuffs can be condemned. This should protect the stock and poultry feeders who may not realize from the reading of the contents of the feed bag that there may be some ingredients injurious to the health of his stock.

As soon as copies of this bill are available they will be sent to the officers of every live stock and poultry organization of the state, and a vigorous campaign is to be made to insure its becoming a law.

Top Dress with Nitrate of Soda

The Poultry Breeders Show

By J. A. Koethen

HALF a dozen pink silkies, guarding a nest full of real pink eggs on a woodsy-looking hillside, made a most alluring window advertisement of the Poultry Breeders' Show in the Coulter Building on Broadway, Los Angeles, which began Wednesday, January 8 and continued to Tuesday evening January 14. A pair of peafowl and several gorgeously colored pheasants attracted almost as much attention in the other window. Inside, on the first floor, crows and cackles from several hundred feathered throats blended with the cries of geese and quacking of ducks in a not unmusical medley, while the second floor was occupied by nearly as many furry aristocrats.

Poultry shows are all alike in their general characteristics, but all differ in the qualities which give atmosphere, if one may use the word in describing a poultry show. The number of entries was not so large this year

Two Great Cockerels
Best R. I. Red male in show. R. C. cockerel owned by Granville Hall Yards. First White Leghorn cockerel owned by E. E. Emerson.

as it has been some previous years, nor was the crowd of visitors so great, but there was a busy hum of enthusiasm and interest reaching from one end of the long room to the other. It caught judges, exhibitors and visitors. It caught passersby who stopped to look at the silkies in the window. There is "something doing" in poultry circles this year. The industry is coming up, and the year on which we are just entering will see, so thoughtful commentators say, something as near a poultry boom as we wish to see. Booms have never been healthy in California, but there should be a steady growth in all lines of poultry husbandry this year which is better than a boom. Especially noticeable is the interest in rabbit culture. "The demand cannot be filled," said a sign in the rabbit department. We must grow as much as possible of our own food, and eggs, chickens, ducks, geese, turkeys and rabbits can all be easily raised in the backyard of a 50-foot lot or around the barnyard of any ranch.

The rise of a new breed into popularity is always an interesting study at the poultry show. It is not five years since the first Rhode Island White was shown in Los Angeles. This year 64 birds were shown, and they were subdivided again into two

Judges at the Southern California Show
Lieut. E. B. Smiley of Nebraska, judge of White Rocks, Anconas, Leghorns, and turkeys. W. S. Russell, Concord, California, Rocks, except Whites, Andalusians, Minorcas, Cornish, Sussex, Asiatics. C. H. Burnett, Jr., Seattle, R. I. Reds, 'Dottes, Orpingtons. Chas. S. Gibson, Detroit, rabbits and cavies.

varieties, Rose Comb and Single Comb. The original R. I. Whites were Single Comb birds, but there were 19 of the latter, most of them birds of fine type and color. The rose comb gives a neat shapeliness to the head which is very taking, to say the least. The splendid records Rhode Island Whites have made at some of the egg laying contests, together with the liking of the American public for a white bird, are combining to give these birds an abundant entrance into the fancier's favor, as well as into the amateur's heart.

But the rise of a new breed is no more interesting than the return of an old one. Barred Rock Alley used to be always the longest. Of late years Reds and sometimes Anconas and Minorcas have given the Barred Rock a run for his money. The Barred Rock is hard to breed, though always worth while when you get his markings right. Cockerel breeding and pullet breeding are perplexing, and the differentiation in color and markings so nice that many an incipient fancier has given up in despair and turned to something easier. Many have persevered, however, in spite of difficulties, and this year Barred Rock Alley is again the longest, 110 birds being shown. This year, too, ribbons were given to both pullet-bred and cockerel-bred males, a distinction which has not always been made.

Next to the Single Comb White Leghorn, which has no competitor for commercial egg production, which is the most popular breed in Southern California? Not the Barred Rock, however dear that may be to the fancier, but the Rhode Island Red. Single Comb Reds were only two behind Barred Rocks in number, but in addition to 108 S. C. Reds there were 32 R. C. Reds. The best male Red in the show was a R. C. Red cockerel, a bird of splendid type and deep rich coloring, and the first pen was very fine. The R. C. Red has all the virtues of the S. C. Red, and has in addition what many consider a more beautiful comb.

Whether it is because they are more easily bred and therefore not so tempting to the real fancier, or because they so nearly resemble the Wyandottes of the same colors, or just that in their utility qualities they have never quite equalled the good old Barred Rocks, the fact remains that White and Buff Rocks lag far behind Barred in the number of their admirers. There were some fine White Rocks in the show, first cock, especially, his sale price was $200, which means that he was some bird. But there seems to be no increasing interest in the breeding of these admirable birds. I have always suspected that fashions in fowls are exactly like fashions in clothes. This year Mr. A comes to the show with a long string of extra fine Anconas or Minorcas or Andalusians, and next year a lot of other folks, who have been impressed by Mr. A's birds and bought eggs from him, come with their strings. Not because the new bird is better than the old, but because it is apparently the "coming" bird and that means sale of hatching eggs and chicks. I have even seen a man who took all the ribbons one year with a string of wonderful birds apparently all his own breeding, come next year with a string of just as fine birds of an entirely different breed. Perhaps there really is a "coming" breed, but I

Liberty Bond
Second at Liberty Fair, first at L. A. Show, and first at Poultry Breeders of Southern California. Bred and owned by E. A. Weaver.

doubt it. All breeds are good, but fashions come and go.

With the Wyandottes, now, the case is slightly different. Wyandottes have never really "come" in California, as they have in the East, where they are considered the best of the dual purpose breeds. A few persons here have bred them and insisted on their excellent qualities. This year at all the shows there has been a noticeable increase in number of White Wyandottes. White Wyandotte Alley, with 50 birds on exhibition, attracted much attention at this show, and the first cockerel received the gold medal for being the best cockerel in the show. There were 23 Silver Wyandottes and 23 Partridge Wyandottes, making nearly 100 Wyandottes all told.

Orpingtons hold their own as as excellent show birds and good layers. They are not usually a large class, but are always a strong one. This year Whites led, and there were some particularly fine specimens among the 25 exhibited. Six Black, eight Buff, twelve Partridge and two Blue Orpingtons made up the list. First White cockerel was one of the best in the show.

There were 42 Anconas, 38 Andalusians and 27 S. C. White Leghorns. First White Leghorn cockerel was a splendid bird, and the whole string of Anconas was good, as it always is. These little birds are not so impressive in their beauty as some of the larger breeds, but to one who knows just what constitutes true beauty in the breed there is much to admire. Minorcas were an unusually small class, only 23 birds of all colors being shown. There were 31 Light Brahmas, 15 Speckled Sussex, 12 Silver Spangled Hamburgs, 7 Black Langshans, and 7 Dark Cornish.

More than the usual number of rare and curious breeds were noted. There were two White Langshans, five Golden Gates, a Black Rhinelander, a pen of Golden Aztecs, three Missouri White Fluffs, four Golden Sierras, one Houdan, and four Japanese Games, the property of Mr. Misoumi, a Los Angeles Japanese. These Games, which are wonderfully gentle in appearance, though willing to fight on occasion, their owner says, were brought from Japan to San Francisco for the 1915 exposition. There were also a couple of Transylvania Bare Necks, a most curious fowl, almost entirely black, with a queer, bare neck, red in the male, and pale in the female. Among the bantams were two specimens of the Java Jungle fowl, the original Gallus Bankiva. The hen looks like a Brown Leghorn, though much smaller. The cock is a yellowish brown. Campines and Buttercups can hardly be called rare birds, but they are becoming rather rare in Los Angeles shows. Apparently they have not made good either as show birds or producers. Two Buttercups and four Campines was the length of the string.

Mention should be made of the one solitary capon, a Rhode Island Red, which must have felt very strange and lonely among his elegantly combed and wattled brothers. Whatever may

Agricultural News Notes of the Pacific Coast

Northern California

Glenn County farm bureau meetings at Codora, Monday, January 13.

The tractor school at CLico, Butte County, will open February 10.

Cloverdale, Sonoma County, holds its next citrus fair in February.

Reports from the Feather River Canyon indicate a fine ice harvest.

Corning, Tehama County, has made carlot shipments of oranges to Eastern markets.

There are 3,000,000 acres of olive trees in the state, more than half of them bearing.

The state highway commission contemplates general extension of construction work.

Over 500 deciduous fruit growers of Sonoma County have attended pruning demonstrations.

The first cotton gin in the Sacramento Valley has been built at Durham, Butte County.

An irrigation project near Chico contemplates placing of 3000 acres of the Phelan ranch under water.

The farm bureau of Butte County is working in conjunction with the community council on reconstruction plans.

The California Tomato Growers Association has signed up several hundred acres among growers of Sonoma County.

Bean threshing in Butte County was not finished until early in January. Some damage has been done by the early rains.

The Sperry Company has a grain elevator or bulk storage plant at South Vallejo with a capacity of one million bushels.

Chairman Behr of the California rice committee is in Washington endeavoring to secure outlet for the great quantity of rice in storehouses.

The cost of the Sutter-Butte by-pass will be reduced by about four million dollars. This is made possible by cutting out the levees through Butte Basin.

There will be a meeting of wool growers at the university farm at Davis January 20 for the purpose of forming a cooperative marketing organization.

The Preston School of Industry near Ione is purchasing pure bred live stock principally for the purpose of interesting the boys attending the school in breeding.

Rio Vista, Solano County, is organizing swamp land reclamation district 317 on the lower point of Andrus Island. It will be used in the growing of asparagus.

Pear growers of California met at the office of State Horticultural Commissioner Hecke and discussed methods of securing more general campaign against blight.

The California state viticultural commission estimates that hundreds of cars of California grapes will be shipped to other states to be used in making home made wine.

Yuba County farm bureau is endeavoring to secure aid from the United States reclamation district in making a survey of the Sacramento Valley, especially of the Yuba River.

Arrangements have been made for the meeting of the Western Berkshire Congress and Berkshire sale to be held in connection with the California International Live Stock Show at San Francisco in February.

Central California

Cold weather in the East has cut down the demand for citrus fruits.

Fresno farmers are talking about "keeping better farm records for 1919."

O. W. Fletter has been elected president of the Santa Cruz County farm bureau.

An office of the United States department of labor will be established in Fresno.

Tulare County has shipped about 3000 cars of citrus fruits since November 1.

One bunch of Shorthorn steers, 102 head, recently sold in Kings County for $12,000.

California last week shipped out 140 carloads of apples, New York taking 37 carloads.

Santa Cruz County is planning a great gopher "drive" during the month of February.

Woodlake, Tulare County, sent out 35 carloads of Navel oranges for the holiday market.

The cannery at Lodi, San Joaquin County, is putting up about 50 tons of pumpkins daily.

The annual meeting of the Tulare County farm bureau was held at Visalia, Thursday, January 16.

Pruning demonstrations are being held in Santa Cruz County under the auspices of the farm bureau.

November prices of butter fat in Kings County dropped two cents from the October price of 69 cents.

Stanislaus County's rice fields while not extensive were very productive, running around 35 sacks to the acre.

The cannery at Selma, Fresno County, packed a large quantity of spinach as well as pumpkins, sweet potatoes, etc.

L. C. Trewhitt has been appointed sales manager of the Kings County unit of the farm bureau marketing association.

The damp foggy weather of the early part of December brought serious loss to the raisin men who were trying to get their fruit dried out.

The cannery at Turlock the past season put up 800 tons of apricots, 3800 tons of peaches, 2000 tons of tomatoes, or a total of about 215,000 cases of fruit.

A Hollister wool grower recently sold his wool in San Francisco at 35 cents per pound. Something over a month ago this same wool commanded around 56 cents.

The Prune and Apricot Growers Association has arranged a meeting with the regents of the state university to ask for more experimental work in deciduous fruit culture.

According to preliminary report on investigations conducted by Bioletti and Cruess of the state university, the making of grape sugar from wine grapes will be entirely practicable.

Thirty-seven tobacco growers of Fresno County pooled their interests and signed up 187,000 pounds of leaf tobacco to one buyer. Price quoted varies from 60 to 85 cents per pound.

The Turlock Merchants and Growers' Association has just completed its fourth season in operation. It has a membership of 7000, with shipping sheds at Turlock, Denair, Keyes, Hatch, McGill, Hilmar, Livingston and Atwater.

Southern California

Imperial County is to experiment with tobacco growing.

San Luis Obispo County has about 7000 acres of almonds.

The Arlington cannery closed its season's work last week.

San Dimas marmalade factory is now employing about 125 hands.

The tractor course at Ontario begins January 27 and ends February 15.

Brawley is ready to start shipping lettuce. The lettuce was not injured by the recent cold.

Some extra early tomatoes planted in the Imperial Valley were caught by the recent cold spell.

Inspectors report highland grown oranges in Riverside section as practically untouched by frost.

Tangerines are proving one of the most profitable of citrus crops to growers in Santa Barbara County.

Riverside tractor course to be held at the grounds of the citrus experiment station begins February 24.

The cold weather is past and the orange groves are now enjoying weather acceptable even to the tenderfoot.

J. M. Davison of Arlington has been elected president of the Southern California Poultry Breeders' Association.

The Fillmore Herald estimates damage to the lemons of that section from the recent cold weather at 15 to 25 per cent.

Brawley, Imperial County, shipped in one day, seven cars milo, six cattle, five cottonseed, five fertilizer and one barley.

San Luis Obispo County proposes to dehydrate carrots and other vegetables, having contracts with the government.

H. W. Campbell, well known exponent of dry farming, is expected to visit Riverside County and talk before farm bureau centers.

The principal discussion at the citrus institute to be held during orange show week at San Bernardino is on frost protection.

It is reported that nearly one-fourth of the olive crop in the Hemet district was nipped by frost so that the fruit will have to be used for oil making.

The Walnut Growers of Southern California met at the Lambert Ranch, El Monte last Monday. Sacks and codling moth both under discussion.

Tepary bean growers are talking of organizing in order to secure more just treatment for Teparies in Eastern markets. This excellent bean seems to be discriminated against.

The Pima roller cotton gin at El Centro is turning out between eight and ten bales of cotton per day. One hundred and twenty-four Pima cotton growers are having their cotton ginned.

Orange growers of Orange, San Bernardino, Los Angeles and Riverside Counties have been asked to pick no oranges for two weeks after the freeze in order to make sure that no frosted fruit goes into the market.

Supervisor Charlton of the Angeles national reserve announces that the government rate for cattle and horse pasturage during the coming season is $1.20 per head for cattle and $1.50 for horses. This is much higher than last season. The year extends from April 1 to April 1.

The Coast and General

Winter wheat in Nevada proves to be wintering well.

Oregon's streams are low because of deficient rainfall.

California oranges dropped a dollar a box in one day in New York.

Extra fancy Winesaps shipped from Spokane are commanding around $2.40 to $2.50.

Brazil's castor seed crop was practically all destroyed by heavy frosts last June.

Cuba's production of sugar is 3,600,000 tons, the largest in the history of the island.

The first sugar beets of Walla Walla County, Washington, were harvested the past season.

Fairly liberal snowfall in Washington has proven very satisfactory to winter wheat growers.

The farmers of Warden, Washington, recently featured a rabbit drive, but only netted 100 jacks.

Farmers of Lewis County, Washington, have greatly reduced dairy costs by large increase in use of silos.

Sugar beet growers of Yakima, Washington, netted $300,000 for beets shipped Idaho-Utah sugar factory.

Tillamook County Creamery Association, Oregon, is advertising to increase consumption of Tillamook cheese.

Boys in the forestry regiments now in France maintain that their usefulness is ended there and are appealing for return home.

The department of agriculture estimates the value of Florida's and California's crop at 19,587,000 "bushels" of oranges at $92,723,000.

The forest supervisor of Okanogan, Washington, is taking applications from live stock men for pasturage permits for next season.

Butter makers and cheese makers of Oregon attended short courses at agricultural college at Corvallis from January 6 to February 1.

The department of agriculture is making its first complete survey of the South Texas onion fields. Last year's production of nine counties aggregated about 18,000 acres.

The annual Corn Growers and Stock Men's Convention scheduled at the college of agriculture of the Illinois University, January 21-30, has been recalled because of the flu.

Edgewick, a small village in the Cedar River basin in Washington, was wiped out and 15 families made homeless by the breaking of a large irrigation reservoir above the town.

The Wapato Indian project in Washton, comprising 74,881 acres, shows production of crops aggregating $7,205,500. This was an increase of a million dollars over the preceding year.

The Arizona Goat Raisers Association and the National Mohair Raisers Association recently convened in Phoenix and made appeal to the government to use mohair in the uniforms of the American army.

The soapweed which grows so luxuriantly on the hills of Arizona which would otherwise be barren, is now proving to be a fairly good stock feed when made into ensilage. A machine has been invented which cuts up this yucca or soapweed so as to make very good stock feed substitute.

To Fight or Not to Fight Jack Frost

Mr. Peyton's Storage Station

Five tanks, each with the capacity of one car of oil, gives a supply which will carry the ranch until other carloads, or train loads if necessary, may be supplied from oil centers. It is necessary to haul in wagon tanks from the cars. The wagon stops so that the outlet enters the big six inch steel pipe shown in the foreground. Gravity carries it into the small tank at reader's right. From there a steam pump, connected with the large pumping plant, lifts it into the large tanks. The station for filling service wagons is on the lower side of these tanks. Mr. Peyton is now laying four inch supply lines down through the orchard so that the shortest possible haul will be necessary when it comes to orchard firing.

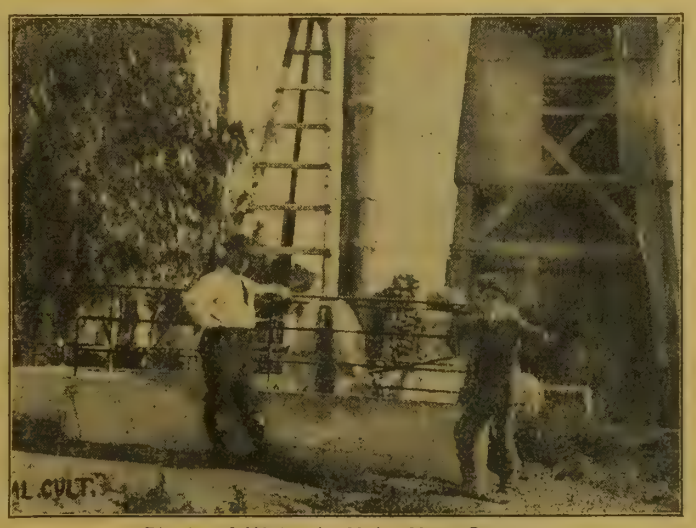
Filling the Heaters

Many orchardists follow the plan of drawing from tank on wagon into five gallon can and pouring into the heater. This is expensive in time, and time is the "essence of the contract" when it comes to frost fighting. The two inch hose saves its cost several times over. The faucet is at the end, in fact at the right hand of the filler in the engraving above. He is filling the 10 gallon heater while next to it is the seven gallon heater, next again the big 10. Thus an almost solid row is maintained along the upper edge of the orchard.

THERE is perhaps less satisfaction in fighting frost than in carrying on any horticultural operation in the state. In the first place the investment in equipment and preparation for the work is so expensive that many growers question the advisability of carrying frost insurance at such a cost. Again, a long continued campaign may exhaust both labor and supplies and nights of successful fighting may be made of no avail because of a lapse in effort for the last hour or two of the campaign.

After the 1916-1917 campaign Prof. R. S. Vaile, at that time with the University of California experiment station, made investigation and approximated cost of average equipment. These averages, he concluded, would run around $145, but even then he makes this addition: "With the present high cost of material this expense would be considerably increased." Cost of the material has been doing little since that date but advance.

There is no means of arriving at present day cost for manufacturers have thrown up their hands and refused to consider the making of orchard heaters for the reason that few orchardists were interested enough even to inquire for them, but we may arbitrarily take some approximate figures and guess that orchard heaters could not be secured today for less than $200 per acre; storage and equipment for handling oil, $25 to $50 per acre. Let us take the low figure which is probably too low. Small equipment, wagon tanks, etc., $30 per acre; oil to be stored and ready for starting operations, $55. There is a total investment of $300 per acre.



At six per cent interest — which is probably lower than the fruit grower will pay—there is $18. Depreciation on such a plant might amount to ten per cent, or another $30. Labor to care for it, under present conditions, certainly would be not less than $10. Hence, without labor or oil consumed in the campaign when the frost fighting is actually on, we have well toward $60 per acre per year overhead.

Frost loss, unlike fire loss, may not be entire. That is, presumably bearing trees will not be killed by any "spell" of weather we may have in California. Also, presumably the loss of fruit will not be absolute. But, assuming that the fruit might be all lost, as was the case in most orchards in 1913, and that the bearing capacity of trees for a year or two may be affected, an arbitrary figure of $1000 annual risk may be taken. That figure, probably, is altogether too high, but in that case the annual overhead frost fighting cost is nearly six per cent on the risk. This is prohibitive from an insurance man's standpoint.

But presumably steel and equipment generally may be lower than at the present moment, and many farmers find themselves supplied with equipment which was secured at a lower cost, and partial replacement and upkeep may be had at prices lower than those given in figures above.

So frost fighting will be continued, especially on such places as that of Valentine Peyton at La Verne in eastern Los Angeles County. This place is a lemon and orange grove of some 200 acres, and Mr. Peyton and his foreman, Mr. Summerville, have planned a frost fighting campaign which involves a much lower cost than our figures above show. However, equipment was practically all purchased at other-day prices. Mr. Peyton has invested approximately $18,000 in pots, $1000 in storage tanks, $1500 in wagons and tanks and $2500 in stored oil. This makes an investment of only about $115 an acre, but this is not full equipment.

The scheme of frost fighting followed on this ranch calls for mass firing of a large number of heaters along the two upper sides of the ranch. Careful observation has proven to the satisfaction of the ranch management that their most dangerous enemy is the drift of cold air from the mountains down over the valley. As this drift of cold air strikes the upper corner of the ranch it comes in contact with the wall of flame rising from the great number of heaters. From careful observation of the large number of thermometers Mr. Summerville thinks that this current of air may be diverted rather than warmed, and as it passes around the lower end of the wall of heaters there may be eddies formed which will result in the cold attacking lower portions of the ranch. These portions have been protected by installation of other orchard heaters at the rate of about 100 to the acre. For this reason probably not more

Plenty of Water to Make More Oranges

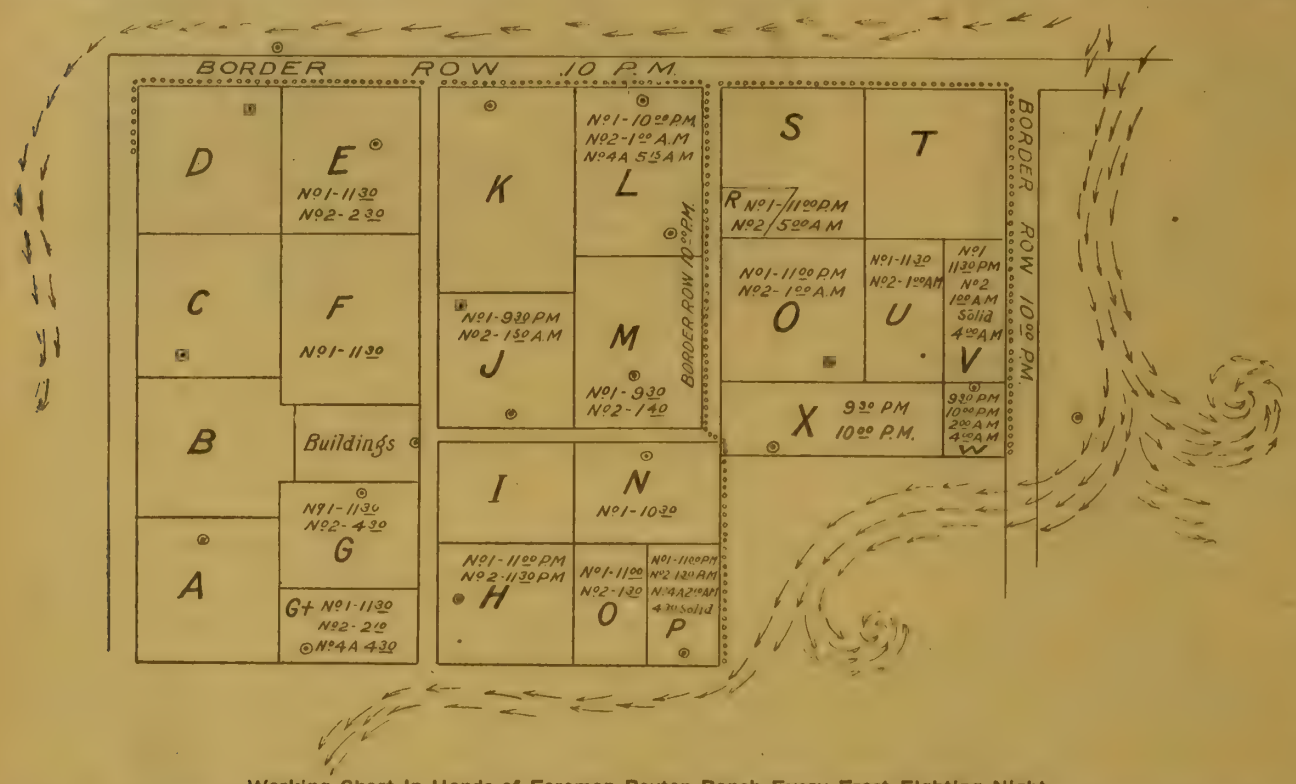
Besides the gravity flow of water from the mountains, the original water right of the ranch, Mr. Peyton has two exceptionally large producing wells. The pumping plant, which cost about $25,000 and is a model of efficiency, is worth a whole story for its efficiency is largely responsible for the success of the ranch. The compressed air system of pumping is used, one well being in the foreground near the ranch foreman, W. D. Somerville. The other well is more in the background and its supply is flowing into the same receptacle between the cobblestone walls nearer to Mr. Peyton the gentleman with the coat.

Ready for the Fight

The heaters here are not massed so heavily as in some portions of the line. It will be noted that there is a double row, the outer row being large ten gallon heaters, the inner the ordinary seven gallon heaters. This double row is supposed to turn the current of cold air drifting from the snow covered mountains in the background. The arrow near the second in the first line of heaters points to a thermometer located down that row in the orchard.

Filling the Lighters

A big bunch of these lighters filled and ready for the night's service is seen at the left. Others with the torch feature removed are on the bench in front of the workman who fills, using kerosene and gasoline. The wick of the torch is asbestos and sufficiently loose so that when the lighter is placed over the fuel in the heater a small quantity of the mixture of kerosene and gasoline is injected into the distillate in the heater and instant lighting is secured.



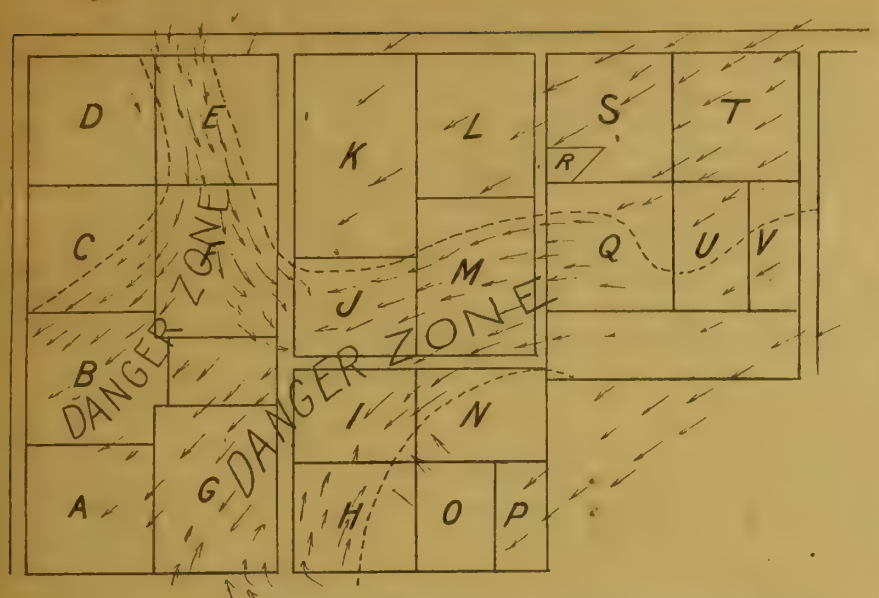
than one-half of the ranch is covered with heaters.

The drift, or currents, of air following definite "channels" is shown by thermometer readings in two adjoining blocks on the Peyton ranch. Ordinarily these two thermometers have read practically the same. In reading them one night, however, the regular observer noted that one stood at 36 while the other continued to drop, finally reaching 28. In looking for a reason the observer finally recalled the fact that in line with the known drift of the air current, but several hundred feet up-grade from the higher registering thermometer, workmen had lighted a number of orchard heaters for their own personal comfort while patrolling the orchard. In distance the heaters were practically the same from the two thermometers, but the one showing low temperature was on much higher ground and much farther to the east out of the drift from the lighted heaters.

In blocks of the lemon orchard where Mr. Peyton's equipment was complete there were lemon trees filled with young fruit, none of which showed injury. Tender tips were untouched and some trees showed blossom buds and even blossoms fully out, and this more than a week after the colder weather. Examination of near-by orchards, where the campaign was not conducted, showed practically all young fruit ruined and even some full sized lemons already showing dry cells.

But here is one serious problem for owners of five or ten acres, which is not a problem for men who have 200 acres, and that is for a man with a small grove, with a few heaters, endeavoring to warm up all outdoors. Frost protection is a matter of cooperation. In fact, at one time there was serious discussion of the proposition to ask the state legislature to provide for frost protection districts somewhat similar to the reclamation districts, all within the district to share in bearing cost of frost fighting. This was, of course, never put through, but there have been organized frost fighting associations, at least one such association, that at Pomona. Where reasonably general cooperation may be secured it becomes comparatively easy to raise the temperature five or ten degrees, and ten degrees difference in temperature means the saving of the crop of oranges and lemons in any weather which has ever come to our citrus districts. And it is to be hoped that with the return to normal conditions in supplies of steel and other requirements for frost fighting equipment that the prohibitive cost now obtaining may be overcome.

(See chart on opposite page.)



Working Chart in Hands of Foreman Peyton Ranch Every Frost Fighting Night

This is the finished record of one night's campaign. The top of the map is north and it will be noted along the north and east sides and down the driveway between Blocks L and S are small circles which indicate a double row of orchard heaters. On the night in question these were fired at 10:00 p. m. Other pots or heaters in orchard were fired as indicated in each block.
The circled dot in the block indicates location of thermometer.
Arrows indicate air currents, or drift, as shown by temperatures.
Blocks S and T given no protection excepting by border fires.
Blocks A, B, C, D and K no protection excepting from border fires and the firing in other blocks.
Firing "No. 1" means half of the heaters in rows 1, 7, 13, 19, 25, 31 on each ten acre plot or 8.1 heaters to the acre.
Firing "No. 2" means half of heaters in rows 4, 10, 16, 22, 28, or 8 heaters to the acre.
Firing "No. 4-A" means half of heaters in 2, 8, 14, 20, 26, 32.
Rows 3, 6, 9, 12, 15, 18, 21, 24, 27, 30, 33 in each protected block are blanks.

TEAGUE QUALITY
CITRUS TREES
AWARDED THE GOLD MEDAL AT FOUR INTERNATIONAL EXPOSITIONS.
For Productive values, fine quality of fruit and vigorous growth Teague's bud-selected, (pedigreed) properly trained and carefully handled orange and lemon, pomelo and lime trees are the trees to plant. An experience covering a third of a century warrants the assertion that Teague Quality Citrus Trees possess these qualifications in a superlative degree. All the standard commercial sorts, and garden and ornamental varieties; the largest assortment of citrus trees in America. . . . We invite correspondence from intending planters. . . . Natural Drift of Air Currents on Peyton Ranch on Average or Ordinary Nights when there is No Artificial Heat

Chart on opposite page gives indication of changes brought about by the frost fighting campaign.

Frozen Lemons and Oranges for By-Products

By E. E. Thomas

A PROBLEM confronting citrus growers at present is whether in groves that have been rather severely frozen, the fruits should be harvested immediately and sent to the by-products factories, or whether such harvest can be delayed until the extent of the injury becomes apparent. If one-third of the fruit remains sound doubtless better financial returns would be obtained by marketing the good fruit than by selling the entire crop for by-products. If, however, the frozen fruit deteriorates rapidly in value for manufacturing purposes, the grower might lose the sale of any portion of the crop if it is all badly frozen and picking is delayed. What are the facts regarding the changes taking place in frozen fruit?

The following data is from studies made by the citrus experiment station following the 1913 freeze.

Sound fruit and badly frozen fruit of navel oranges and Eureka lemons were picked every four days following the freeze for a period of two and one-half months, and these were weighed and analyzed. These were compared with sound fruit and frozen fruit picked immediately after the freeze and stored.

It was found that the weight or density (specific gravity) of the frozen fruit decreases rapidly, whether the fruit is picked and stored or remains on the tree, while the unfrozen fruit increases in density when picked from the tree and stored and remains about the same if left on the tree.

The unfrozen oranges in storage show a variation in the amount of total sugar present but show no progressive changes, thus indicating that the variation is probably due to the difference in individual samples taken for analysis. The average of the unfrozen lots in storage was 9.16 per cent, the frozen 7.42 per cent throughout the experiment. The percentage of sugar in the juice of the lemons shows the same kind of variation as was the case in the oranges. However, the great change which has been taking place in the fruit is more clearly illustrated when we consider the actual amount of sugar present in the unfrozen and frozen fruits. We find that the actual amount of sugar in a frozen orange, expressed in grams of sugar per fruit, drops to less than two grams of sugar per fruit, against an average of 6.5 grams for an unfrozen fruit. The fruit remaining on the trees showed almost the same differences, as the frozen fruit dropped to the same point, while the good fruit showed a slightly greater average than the stored fruit, or 6.9 grams. The lemons again show the same kind of variation as is found in the oranges, but in a different degree. The unfrozen lemons held in storage average one gram of sugar per fruit while those that were frozen decreased from .7 to .2 grams per fruit. The fruits which remained on the trees showed about the same amount of variation. There seems to be no change in the relative amounts of the different classes of sugar present.

The per cent of acid in the frozen and unfrozen oranges in storage decreased in almost the same degree, the average of both lots of fruit being 1.49 per cent. The fruit picked at intervals showed the same change, but had a lower average. The unfrozen oranges showed 1.45 per cent and the frozen 1.43 per cent. We find again, however, that, as with sugar, the total amount of acid present decreases very markedly in the frozen fruit. The frozen oranges show .3 of a gram of acid per fruit in comparison with an average of about one gram in unfrozen oranges. Owing to the fact that lemons have a much higher percentage of acid than do the oranges, we find a much greater variation between the unfrozen and frozen fruit than is the case with oranges. The unfrozen lemons kept in storage averaged 7 per cent acid throughout the experiment, while the frozen ones averaged 5.2 per cent. The acid in the fruit picked at different intervals averaged 6.3 per cent in unfrozen lemons and 4.6 per cent in frozen samples. When we come to the actual amount of acid present, the great difference in the fruit is shown. We find that the unfrozen lemons vary to a considerable degree in the amount of acids present ranging from two to three grams per fruit, while in the frozen fruit it practically all disappears. (See table.)

Grams of Acid per Fruit—Eureka Lemons

Date.	Unfrozen stored.	Frozen stored.	Unfrozen picked fr'm tree.	Frozen picked fr'm tree.
Jan. 14..	2.3	...	2.3	...
Jan. 18..	2.0	1.5	2.0	1.2
Jan. 22..	2.9	1.0	2.4	0.8
Jan. 26..	2.9	0.7	Lost	0.7
Jan. 30..	2.8	0.4	2.3	0.4
Feb. 7..	2.7	0.3	2.2	0.3
Feb. 15..	2.0	...	2.3	0.2
Feb. 23..	...	...	2.3	0.2
Mar. 3..	2.8	0.1	3.0	0.5
Mar. 7..	...	...	1.6	0.2

We see from these analyses that when the fruit is badly frozen it is advisable to sell it at once to a by-products factory owing to the fact that within ten days after the freeze it is found that one-half of the total amount of acid present in the fruit is lost. This decrease does not stop at this point, however, but is very rapid for the first month after the fruit is frozen. Where the fruit is only partially frozen a more serious problem arises, due to the fact that some of the fruit may be entirely free from injury by the frost, and it would thus bring a very much higher financial return if picked and sold as good fruit than if sent to the by-products factory.

Now we know that when the kaiser said "the hour is grave" he meant "the grave is ours."—F. N. F.

We easily forget our faults when they are only known to ourselves.

The FRUIT GROWER says=

"for tree planting genuine GIANT is most satisfactory"

The Giant Farm Powders—Eureka Stumping and Giant Stumping—loosen and pulverize the soil instead of packing it and throwing it high in the air.

Western fruit growers have used hundreds of tons of these Giant Powders for blasting beds for trees. They have proved that blasting with genuine Giant Powders provides free drainage, increases moisture-storage capacity and insures vigorous growth and early bearing.

"My trees planted three years ago in beds blasted with Giant Powder are 75 to 100 per cent bigger and better than the trees that I planted in dug holes," writes H. H. Smith, Oregon City.

You will enjoy reading "Better Farming with Giant Farm Powders." It describes all the new and money-saving methods of blasting beds for trees, subsoiling established groves and orchards, clearing land, ditching, etc. Write for it now.

Grape Syrup

MORE than 40,000 tons of sugar, of a present value of nearly $8,000,000, can be conserved if the 250,000 tons of wine and table grapes that cannot be used next year in the usual way are made into grape sugar.

This is the conclusion reached by Professors Frederic T. Bioletti and W. V. Cruess of the college of agriculture of the University of California after an investigation into the possible utilization of wine and table grapes covering a number of months. A preliminary report of their investigations is published in a bulletin just issued by the University Press.

The conclusions are as follows:

"About 250,000 tons of wine and table grapes cannot be used next year in the usual way.

"This represents a value of the raw material of over $4,000,000, and of about twice this amount in the manufactured state as wine, etc.

"Their loss would involve the ruin of thousands of grape growers.

"If they were made into grape syrup the product saved would be equivalent to over 40,000 tons of sugar of a present value of nearly $8,000,000.

"Investigation has shown that a grape syrup can be made which is wholesome, attractive, and suitable for table use, cooking, the making of jams, and fruit butters, and for the canning of most of our fruits.

"Most of the equipment necessary for making this syrup already exists in the wineries and sugar beet factories of the state and what is lacking could be easily obtained.

"The marketing of this large quantity of a new product could be successfully done only if many fruit canneries could be induced to use a certain quantity of grape syrup during the season of 1920. This could probably be done only by suitable governmental regulation."

The bulletin may be had upon application to the Director of the College of Agriculture, Berkeley, California.

We quote entire the introduction, which contains many interesting points:

Sugar in Grapes

Ripe grapes, especially those grown in California, are so sweet that their use as a source of sugar is naturally suggested. Most of the proposals to utilize them for this purpose, however, are based on a misunderstanding of the nature of the raw material and of the proposed products.

Various Kinds of Sugar

Sugar, in the common use of the word, means dry, granulated or crystallized sucrose. This is only one of several sugars and one which cannot be produced from grapes because they contain none. Grapes contain, however, two sugars, glucose and levulose, both of which are wholesome foods. The sweetness of glucose is less than that of sucrose, but that of levulose is greater. The mixture known as grape sugar has about the same degree of sweetness as sucrose, usually called cane sugar. What is often known in commerce as "grape sugar" is simply glucose and is made from corn or other starchy material. It is less sweet than real grape sugar.

At present, no method is known by which the sugar in grapes can be given the dry, granulated texture required in commercial sugar. A sugar syrup, however, can be made from grapes and their sweetness utilized in this way.

Sugar Syrups

Sweet syrups are of various kinds which it is necessary to distinguish and understand before attempting the manufacture of any of them.

A syrup can be made by dissolving pure cane sugar in a little water. Such a syrup is that used in canning. It is perfectly neutral in flavor, that is, it has no taste but that of sweetness. Similar neutral syrups can be made in the same way from pure glucose or other sugar.

Syrups of varying flavors, on the other hand, can be made from impure cane or other sugars. The syrups commonly sold, such as maple syrup, sorghum syrup, corn syrup, "golden syrup," and molasses are of this character. The flavors may be agreeable or disagreeable, according to the nature of the impurities to which they are due. These imprities, moreover, may be wholesome, unwholesome, or indifferent.

If the flavors are agreeable and the impurities harmless the syrup may be preferable for some purposes to pure, neutral cane sugar syrup. This is the case for some tastes with maple syrup and others, and when a market is established for such syrups, they command a higher price than the neutral syrups with which they do not compete. On the other hand, if the flavors are not agreeable, the syrups must compete with neutral syrups and this they can do successfully only by being sold at a lower price.

Grape Sugar

To manufacture and market grape syrup successfully, we must therefore attain one of the following results:

1. Produce a neutral syrup that can be sold profitably at the same price as cane sugar syrup.

2. Produce a syrup of inferior quality that can be sold profitably at a lower price than cane sugar syrup.

3. Produce a syrup of superior quality that will attract consumers at a price higher than that of ordinary cane syrup.

Preliminary tests indicate that probably the first two results cannot be obtained under ordinary conditions of the market. To raise grapes profitably they should bring at least $15 per ton and this would represent a cost of close to four cents per pound for the sugar they contain. To this cost must be added the expenses of manufacture which would bring the cost of the finished syrup higher than that ordinarily ruling for cane sugar syrup. With the present high cost of cane sugar, a neutral grape syrup might be sold for a price that would make it possible to pay $15 or more per ton to the growers. Grapes this year, however, are bringing much more than this for other purposes, and if the price of grapes falls, it is probable that that of sugar will fall in proportion.

The only chance of making grape syrup profitably as a permanent industry, therefore, seems to be to obtain a product that will command a price higher than that of the ordinary cheap syrups. It can do this only if it possesses qualities that are preferred by consumers. It must, in other words, be sold on a basis similar to that of maple syrup.

The more distinct the flavor, providing it is agreeable, the more likely it is to find and keep a permanent profitable market. It would seem a mistake, therefore, to attempt to make

a syrup of neutral flavor to compete with cane syrup.

Nature of the Investigations

The two problems to be solved then are:

1. Can a grape syrup be made that will be bought for its special qualities? and

2. Can it be produced and sold at prices which will attract the consumer and pay the grape grower?

The production of grape syrup involves: (1) growing the grapes, (2) extracting the juice, (3) concentrating the syrup.

No changes are necessary in growing the grapes. Cull table grapes, second crop raisin grapes, and in case of the prohibition of wine making, wine grapes are the available raw material.

Wineries are already equipped for extracting the juice for wine making purposes and would require few changes or additions to prepare juice for syrup making.

Condensers for making the grape syrup needed in sweet wine already exist in many wineries. Their output, however, is small and the product not well suited for the object in view. They would have to be considerably modified and expanded to be of much use in making table syrup. The beet sugar factories, however, have a very large capacity, sufficient to handle all the grapes grown in California and could be adapted to the manufacture of grape syrup with little change. As they are idle for several months in the year, they could easily concentrate all the grape juice that would be available if this juice could be obtained during the proper season of the year. This season is the spring and summer when they are not busy with beets.

One of the main problems, therefore, is the keeping and storage of the juice from the vintage to the spring.

AMERICAN POMOLOGICAL SOCIETY

The report of the last meeting of the society, at Boston, is ready for mailing. The volume will be excellently illustrated and will contain several papers of particular value to both amateur and professional pomologists. The regular membership fee for the biennial period is $2.00; for life, $25; for associate societies $10 and $5.00 respectively. Further information upon the subject of the society and its program of activities may be procured by addressing the Secretary, 2033 Park Road, Washington, D. C.

Recently President Bailey has been advised that many of the state horticultural societies have taken action covering the new membership, given life at the Boston meeting. This betokens a renewed interest on the part of the state societies in this old and stable organization and bespeaks much for the increased activities, attendance and results at the next meeting, which probably will be held in some Eastern center the latter part of 1919, though as yet the executive committee has not taken action upon the questions of time and place for the event.

It is expected that New York, Pennsylvania, Delaware, Maryland and the District of Columbia will be in the race for the convention. If the reader has any preference or knows any good reasons why some place in particular should be selected he ought to write the committee or secretary his views.

A feature of the 1919 session will be another student judging contest. Committees in charge of the several phases of the society work will soon be announced; in particular will an early announcement be made of the committee in charge of the score card, judging contest and exhibits.

SPRAY TO SAVE THE FRUIT CROP

Fruit, either in fresh, dried, canned, preserved or jellied form is a food product of recognized value. The maximum production of good fruit at this time is, therefore, of paramount importance. Directly concerned in the production of such fruit are spraying operations for the control of various insects and diseases.

Owners of commercial orchards have long recognized the importance of spraying, but there are many small orchards and so-called home orchards, the owners of which have not adopted spraying operations or do not give sufficient attention to the work. The uncared for condition of such orchards is too often revealed by the great number of windfall fruits and the inferiority of that which remains on the trees.

No single feature of orchard practice yields so high a percentage of benefit as spraying, often increasing the value of the product several hundred per cent. Every fruit grower, large or small, has it within his power to save his fruit from loss by insect and fungous pests, and thus add materially to the food supply of the nation. Spraying is now recognized by progressive growers as an exceedingly cheap form of insurance, not only protecting the fruit during the growing season, but insuring its proper keeping in storage.

ARSENIC UNDER EMBARGO

At the request of the United States food administration, the war trade board has placed an embargo on the exportation of white arsenic. The chief purpose of this order is to protect American farmers and gardeners against a shortage of arsenic insecticides.

Besides feeding ourselves, the United States is pledged to feed the Allies, and we must also supply the people in territory now being recovered from German dominion. We must realize that peace will bring no additional food, but instead increased obligations. Poland, the Balkans and other parts of Europe now isolated from relief will clamor for a share of our present and future reserves.

Thus strict conservation in all foods and feeds stored on farms is imperative in addition to the food program for homes and public eating places. Compliance with these requests will enable the United States to fulfill present obligations and be ready for new responsibilities.

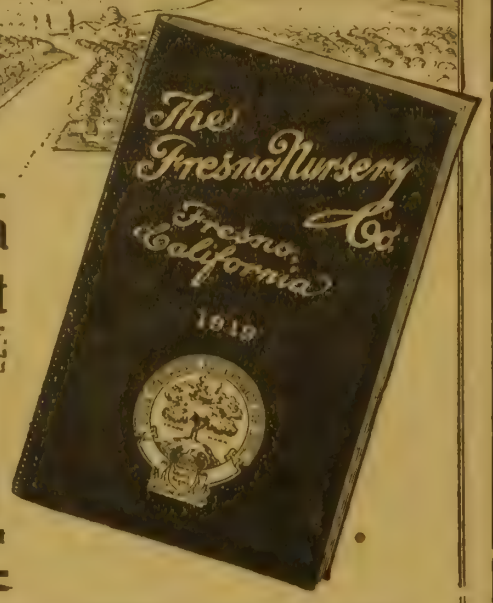
Power at the Drawbar is What Counts

The tractor you purchase should have a powerful motor—but that isn't all. The power of the motor should be delivered in actual pull without undue losses. The high percentage of its motor power delivered at the drawbar is an important point of "Caterpillar" Tractor supremacy.

The "Caterpillar" Tractor has a remarkably simple and direct transmission. It has no complicated, power-robbing differential. Its simple, long-lived track positively eliminates power losses due to ground-slippage. Those items mean superiority in design, and it is because of superiority in design that the "Caterpillar" Tractor invariably stands foremost not only in public and private competitions of every description, but also in the continuous test of severe every-day work.



The "Caterpillar" Tractor's position in the lead was not the achievement of a moment, but the result of more than three decades of manufacturing experience—experience coupled with the highest standards, rigidly maintained, of workmanship and materials.

These points in construction and materials are explained in "Caterpillar" Tractor Catalog No. 392, which also tells many other things you will want to know if you are interested in tractors. It will be sent on request.

An Orchard is a Good Investment

Write today for this

TREE Catalog

and learn how to plant and grow trees successfully

THIS BOOK answers in a satisfactory manner many questions which you may want to know, for instance, if you are going to plant plums, what kind?

Early varieties of peaches bring good returns, but an assortment of peaches ripening from May to November is in many cases preferable.

While the Tilton Apricot is the canners' favorite, there are others equally good. Some trees grow and bear best in the warm interior valleys while others do better at a higher altitude along the foothills.

Growing almonds has become very profitable. Do you know whether your locality is suited to almond culture?

If you are in doubt as to what trees would do best on your land, write to us, describing as fully as possible all of the conditions, and we will be glad to advise you.

Send for Our Illustrated Catalogue and Price List. Contains 104 pages of real valuable information for fruit growers.—Free on request.

The Fresno Nursery Co.
P. O. Box 615-C Fresno, Calif.

Coates French Prune

After years of experimentation we have "bred up" several varieties of French prune which are reproducing exactly to type, the fruit being larger, and trees more regular bearers. Prices no higher than for any other good trees. Call next summer and see our ten acre Demonstration orchard, and order your trees now. We have plenty of trees on all roots ready to ship any time. Also Pears, Almonds, Apricots, and full general assortment. No better trees or more reliable.

Landscape Gardening

The best assorted stock of ornamental shrubs and trees in this part of the State. Liberal terms to dealers.

The Garden

Written for California Cultivator By Ernest Braunton

THERE are considerably over a hundred named varieties of avocados in California, and each promoter knows that his is the best. Someone told me that it would require great courage to say which one was best or which half dozen were best. Well, deponent will so state. Deponent is defined as one who testifies in a court of justice, and I am going to make a just statement with the Cultivator as a court and, as our readers well know, "justice to all" is our motto.

But first of all, let me get behind the other fellow. In 1917 the Avocado Association recommended a list of eight varieties which are here given, from memory, in alphabetical order. They are: Blakeman, Dickinson, Fuerte, Lyon, Puebla, Spinks, Sharpless and Taft. Long ago I decided that the Fuerte is the one best for family use, and even promoters of other varieties have acknowledged the truth of this statement. After full investigation I believe it is the equal of any for commercial planting also. At the Liberty Fair in Los Angeles I met that prince of horticulturists, Geo. C. Roeding of Fresno. When I mentioned the increasing number of varieties and the range in values, he said: "There is none better than the Fuerte." So why should I stand abashed in the presence of him who asks: Which is best? Whether it really possesses the finest flavor, or my taster was in excellent condition, I know not, but the most delicious single fruit I have eaten was a Puebla, and this opinion is shared by some others who have eaten many varieties. Make up your mind before March to plant one or more avocados in the garden.

A Near-Orange

There grows in India a large handsome tree that bears a large citrous fruit, but not of the genus citrus, to which oranges and lemons belong. The fruit is frequently six inches in diameter, of orange shape, of greenish yellow color and possessed of a hard shell one-eighth inch thick. This shell is divided into a dozen or more long narrow cells which are filled with an orange colored aromatic pulp which the Hindus esteem beyond any citrous fruit. It is said the white man does not prize it so highly but makes of it excellent drinks or sherbets. The fruit is of considerable medicinal value, as when ripe it is mildly laxative and also beneficial to dyspeptics, while the unripe fruit is of still greater value for dysentery and in no wise injurious or dangerous. The tree is hardy, enduring temperatures below 20 degrees. Our government has for years been growing a few trees in various parts; why not plant more? Uncle Sammy should pass the seeds around more freely. The name of this tree is Aegle marmelos, and there is a small spiny tree of less value, but closely related, named Aeglopsis, which means "similar in appearance to an Aegle." There are scores of species of citrous trees that should be given trial for stock on which to bud citrus fruits, for some of them are hardy and inhabit swamps near the sea, wherefore we may yet grow oranges in our marshy peat lands.

Cork Plants

For the most part cork comes from an oak tree known as Quercus suber, but at least one other and closely allied species also furnishes cork of commerce. These trees thrive in all parts of California and in a variety of soils and general conditions. The corky barked elm is common in the northern half of this state, but rare in the south as locally deciduous trees are not popular. There is also a corky barked maple from Japan and other species somewhat corky. In one species of evonymus the branches on old trees have corky wings. But none of these except the cork oak have bark of commercial value and none of them are as beautiful as this oak.

The Abelias

There are several species of abelia grown, though but two are common in California, and these are of about equal value as ornamentals. One of these is said to be a garden hybrid. But little attention may be paid to these points by the garden owner, for what we want is abelias, and many of them. Where small shrubs only are needed I know of nothing more satisfactory. At all times of the year they are neat and clean and need no pruning or special care. When covered with the little flowers of bell shape they are peculiarly attractive. Plant the one known as grandiflora or rupestris.

Fruiting Hedges

The strawberry guava makes a fine hedge and yields a fruit which has few superiors, but the plants are without thorns and attract rather than repel all those who come in contact with them. Carissa will make a low broad hedge and its beautiful ivory-like thorns will halt the rush of any and all animal life, but the plants are not tall enough for effective hedges. Aberia Caffra, the kei apple from the Cape of Good Hope, is a small tree that may be trained to any shape or size desired in hedges and also bears repellent thorns. The kei apple is not related to any other fruit we grow, but is a round, strongly acid fruit, one and one-half inches in diameter and is used for either pickles or preserves. Though is does fruit freely under hard conditions, the tree is hardy, and responsive to good care.

Chinese Gooseberry

Actinidia Chinensis is the name of a vine of unusual value, since it is ornamental and fruitful. There are other actinidias of merit, but this one is the most beautiful and has the largest flowers and fruits. The latter have the flavor of a gooseberry, egg shaped, about an inch long. A. arguta, from

R. H. SHUMWAY, Rockford, Ill.

China, Japan and Korea, also bears a fruit of similar size, but more sweet to the taste. Either is preferable to a vine that fruits not.

The Biggest Tree

Adamsonia digitata, a member of the silk cotton tree family, is said to have the largest trunk of any tree in the world but it does not grow to more than 60 feet in height. Trees having a trunk diameter of more than 30 feet are not rare in its native Africa. There it is called the baobab, but I call it a boob, for it will not grow in California. 'Tis a pity, too, for it bears a very attractive flower six inches across. One of the trees may occasionally be found in gardens of extreme south Florida, and there the gourd-like fruit is called monkey's bread. Whether or not any of the trees surpass in girth our largest big trees is a matter of doubt.

Broad-Leaved Pines

To those living in warm sections and who are interested in trees both curious and beautiful, I would recommend the planting of a Kawri pine from New Zealand or Australia. Unlike the pines proper, these species of agathis have what appears to be true leaves, some of which are three inches wide, four inches long, and of thick leathery texture, very attractive. To one well versed in trees the agathis looks as little like a conifer as any tree familiar to us. A small specimen quickly grown quite closely resembles a woody stalked lily plant. A few specimens 40 or more feet high may be found in and around Los Angeles.

A Dual Purpose Climber

In Japan and China there grow two showy climbers, related to the barberries, that grow edible fruits, though but sparely. It is believed that in sunny exposures with rich, well drained soils the crop would be heavier. But in heavy or soggy soils the vines do not thrive. For covering partially, or where dense shade is not wanted, these vines should prove ideal. One species has been somewhat common in California for a half century. The botanical names are Akebia quinnata and A. lobata, and the writer has planted both species in local gardens. Fruits he has not yet seen, but they are said to grow to five inches in length, with a seed imbedded pulp not unlike that of a pomegranate.

Candlenut Tree

In the Orange County exhibit at the Liberty Fair in Los Angeles there was a basket full of fruits from a species of Aleurites, variously known as candlenut, candleberry tree, varnish tree, and wood oil tree. They are cultivated in the tropics for the oil derived from the seeds, an oil much superior to linseed oil. A commercial planting of these trees was made in Orange County a dozen years ago, but what use has been made of the nuts I do not know. It appears doubtful if these tropical trees would prove a commercial success in California, but the grove herein mentioned should now be old enough to demonstrate its value if it has any.

Color Harmony

Harmony of color is insufficiently considered in the making of gardens. Not alone should harmony prevail between all parts, objects and structures, but between the garden and its immediate surroundings. It should not constitute a "sore spot" in the general landscape. Flowers there should be in profusion but do not seek to have every color in great masses, and only white should heavily predominate if but a single leading color is used. The so called "scarlet and gold" has a seductive sound and is really a fine combination but it simply means an excess of red and yellow as compared with other colors. Few colors in mass and strength are far better than many dabs of many colors. Modesty and dignity is the effect to be sought.

The Floral Procession

It is not for all of us to have a perfect flower garden at any time. Still fewer may have one highly attractive at all times. It costs much time, labor, and money to keep up a constant or continual pocession of flowers. Just now our daffodils and other bulbs will be coming into bloom. Sixty days more, and their glory has passed. Shall we leave the beds bare all summer, or shall we plant them with seeds or plants? Shall we sow seeds broadcast and await the flowers, or shall we have plants growing in boxes that we may at once replant and quickly gain floral effects? Then when summer goes, shall we have an autumn crop while waiting for the daffodils to appear? These questions you will have to decide for yourself. You will find plenty of work but that is the price of a continuous floral succession.

Garden Equipment

Fully one-half of the possible joys of gardening are denied those who toil with an insufficient equipment. In every garden there should be a tool and storage house for the garden alone. Do not look for the farm or orchard pruning shears when you come to prune, but have a garden pair that is ever in excellent condition. There can be no fine garden on the farm if you use farm tools and equipment except you may also use farm labor. As a rule woman is the gardener in the rural home and she has to use such tools as she may find not in use. This is a most discouraging phase of the work; for nothing so adds to the joys of gardening as an excess of good tools. You cannot have too many.

ORDER AND PLANT SOON

In the frozen up East they have two seasons of tree planting, fall and spring. The spring season is exceptionally short, but, as short as it is, we do not believe there are as many planters who defer to the last moment as there are in California. Here we have but one season and it lasts from late November till late January or even late February. But go to any nursery as late as April and we will see deciduous trees, root system a mass of little rootlets just starting, young leaves on the tree, being delivered to orchardists who have waited too late to get best returns from the first season's growth. Too many orchardists are busy waiting until it rains or until it stops raining or until something turns up. Then the rush is made for any remnants or job lots which may be had. It is a great planting year for returns received during the past two years and, better than all, cooperative methods, to a degree guarantee the business of fruit raising.

"The BEAN is the Best"

Spray Now!

Clean up your trees! Rid them of moss and scale! Go after big crops of good fruit! Growers all over this State are busy with their winter spraying—and these are the growers who will get the money in harvest time. If you haven't a good sprayer—pick from the complete line of

BEAN Power Sprayers

Built in a variety of sizes from the sturdy, efficient little Bean Pony Duplex Outfit to the big Bean Giant Triplex, which supplies several lines of hose.

All are BEAN QUALITY through and through—it's simply a matter of how large your orchard is.

You'll get Bean dependability—reliability—efficiency—sturdiness—in any Bean outfit you buy. Better see your nearest Bean dealer at once—or send the coupon to us without delay. The quicker you clean up your trees the better.

You can't afford to miss any clear weather until the work is done.

Bean Spray Guns are supplanting spray rods this year. They save time, money, labor. Check coupon for descriptive folder.

GIVE YOUR K-W MAGNETO the Care it has Earned NOW

It is only human nature not to pay much attention to any piece of machinery as long as it runs all right. Like thousands of others your tractor operator may have neglected to give your K-W Magneto the attention its faithful service deserved during the past year. But don't allow it to be run another year under these same conditions.

Our interest and responsibility in your K-W Magneto never ceases. We so carefully build each K-W Magneto that it will give years of efficient, reliable service if given ordinary care. But we don't stop there. We feel it our duty to show you how to keep it in A-1 shape by telling you what *to do* and what to avoid.

What To Do

Just follow the few simple instructions found in your K-W instruction book, and you can put your magneto in A-1 shape yourself. If you have lost your instruction book we will send one free on request.

What Not To Do

Don't tear down your magneto or allow any ordinary mechanic or garage man to do so either. If your magneto needs repairing—if it has become damaged, or put out of adjustment through the carelessness of some farm hand, send it to the nearest K-W "Licensed" Service Station.

A Factory Repair Promptly

In selecting these Service Stations we have chosen only such concerns as have the necessary equipment, a complete stock of repair parts, anda crew of expert mechanics who "know" magnetos, and can give you a "factory" repair promptly.

Don't Delay a Minute

Tractor owners everywhere are having their tractors overhauled now. In having yours put in shape for the spring plowing and the year of hard work ahead of it, don't overlook your magneto. Test it now and if it needs repairing, write us at once for the name of the K-W "Licensed" Service Station nearest you. Give your K-W Magneto the care a year of faithful service has earned.

THE K-W IGNITION Co. 2895 Chester Ave. CLEVELAND, OHIO, U.S.A.

We also build deep well turbines, deep well plungers, horizontal and vertical pumps for mining, irrigation, drainage.

Growing Milo

THE Imperial Valley promises to become "the granary of the world" in the matter of milo, or, as the Imperialite persists in calling it, corn The Cultivator has usually taken exception to this use of the term,—not but what it is correct enough—but it is somewhat confusing in view of the fact that in discussing the three billion bushel crop which the United States may produce next year the government statistics refer to Indian corn and not to the sorghums. But, call it what we will, the returns produced in the Imperial Valley are a great factor in its wealth and a greater factor in feeding the world, especially some of its live stock.

One of the most successful crops of milo, according to the El Centro Progress, raised in the valley is that on the ranch of J. C. Sharp and Son, formerly the W. E. Wilsie ranch west of El Centro.

Regarding cultural practice in the production of this crop we quote from Mr. Sharp's description of his methods:

Mr. Sharp has a theory that like produces like and he ascribes much of his success to the care he took in selecting his seed. He says the cost of seed is a very small item of expense in raising milo and it is false economy to buy poor seed because it is cheap. Get the best seed, whatever the price. The seed used was propagated at the Kansas City experimental farm at Garden City.

"Every farmer has his own theory as to just how and when to plant barley, milo, alfalfa and every other crop and as to how often the same should be irrigated. Some plant corn on ridges, others in furrows, others still on the level ground. Each method has its advocates. Because Mr. Sharp and his son have made such a signal success of their milo crop we believe it will prove of interest to our readers to know just how it was done.

"The field selected for the crop was in a very bad condition. Cotton had been grown on it for several years and as the crop had not been properly cultivated, Bermuda grass and weeds had taken entire possession. Mr. Sharp has another theory, and that is that deep plowing enables the water to get into the soil where it will do the most good. He started a caterpillar to work plowing in May and turned the entire field over to a depth of 16 inches, and when the plowing was done the field looked like a section of No Man's Land where Yankee shells had exploded. A large lister well weighted down, hooked to a caterpillar leveled the field somewhat and the water was poured on for a couple of weeks, and the field took water like a sponge. The foul seeds sprouted and when the land was dry enough to work it was thoroughly disced for the double purpose of killing the weeds and subduing the soil. After another irrigation and another discing to kill weeds that had again sprouted, a smoothing harrow finished the seed bed, which was then as mellow, moist and smooth as a garden.

"No ridges or furrows were made, the corn being planted on the level ground with a common two-row planter. About five pounds of seed were used to the acre. The seed sprouted quickly and grew rapidly and no further work was done on the field till the heads were beginning to form, the two irrigations before planting being enough to carry it that far. Since then the land has been kept moist, three irrigations being sufficient. Most farmers cultivate their corn while it is growing, but Mr. Sharp believes that the proper time to cultivate corn is before it is planted.

"Planting commenced July 1 and was finished August 5. Ordinarily it takes 120 days to mature a crop of milo maize in Imperial Valley, but this crop will beat that at least a couple of weeks. The day we visited the field the corn had been growing 86 days, counting from the first day of planting. The heads were well filled and at a distance the corn appeared to be ripe. Close inspection, however, revealed the fact that it was not fully matured. Three weeks more and the crop will be ready to cut, making 105 days from the day of planting.

"Mr. Sharp believes the 200 acres will average over a ton to the acre. One field of 80 acres, where the grain appears to be especially good, will produce fully 125 tons, so he says, and his judgment is backed by many who have examined the field. This he intends storing for seed.

"Here, in brief, are Mr. Sharp's rules for raising milo maize:

"Irrigate thoroughly before planting.

Kill the weeds by thoroughly discing the soil.

"Exercise great care in preparation of the seed bed.

Don't over-irrigate, but keep the corn growing steadily by keeping the ground moist.

Plant the dwarf variety of milo.

"Plant good clean seed.

"Plant on the level ground."

Control of Ground Squirrels

U. R. STEWART and John S. Burd unite in authorship of Bulletin 302, "Control of Ground Squirrels by the Fumigation Method." This bulletin may be had by addressing Agricultural Experiment Station, College of Agriculture, Berkeley, California. It refers to the five different methods of control, poison, fumigation with carbon bisulfide, trapping, shooting, natural enemies, and concludes that carbon bisulfide is the most satisfactory. There is so much interest in squirrel control at this time that we quote from its conclusions:

"The series of experiments here described clearly shows that carbon bisulfide is an eminently satisfactory fumigant for ground squirrels. Twenty minutes' to half an hour's treatment with air containing two per cent of carbon bisulfide is certain to be fatal. The concentration of gas actually used in practice will of necessity vary with the volume of the burrow which of course is not known to the operator. The dosage of one and a half to two ounces usual in the waste ball method corresponds to about two per cent gas in what we consider to be large burrows. The concentration in small burrows would be proportionately greater. Unless a burrow happens to be much larger than any we have found, the concentration produced with the usual dosage should be sufficient to kill in about 20 minutes, always, provided the vapor is completely diffused.

"It is not sufficient under adverse conditions to merely drop the carbon

bisulfide in the burrow on a waste ball. This will produce good results if everything is favorable. When the ground is level or slightly sloping the gas will flow for twenty or thirty feet to the lowest part of the burrow. Our experiments with the artificial burrow, as well as Dixon's field observations in the San Joaquin Valley, demonstrate that the gas will not flow over elevations of one or two feet. Exploding the gas will distribute it somewhat more but not sufficiently to make it rise over the usual irregularities.

"This clearly indicates that some form of apparatus to pump the gas is desirable. The commercial machines which were formerly on the market were all too expensive, ranging in price from $5.00 to $25. It is clear that all that is necessary is a bellows or large bored pump which will blow a strong stream of air through the tank which contains liquid carbon bisulfide. For field work in the San Joaquin or Sacramento Valley, where it is possible to drive readily over the country, a blacksmith's rotary blower, or hand spray outfit could be connected to a vaporizing tank and mounted on a wagon with one man to operate the pump and another to fumigate. In this way great efficiency may be obtained. If a power spray outfit were adapted for the purpose it would be necessary to observe great care to keep carbon bisulfide gas away from the exhaust of the engine and avoid the possibility of a serious explosion. It is believed that any handy person ought to be able to devise a satisfactory fumigation apparatus out of materials to be found on the average ranch. Circular 181 of this station illustrates and gives dimensions of the complete squirrel "Destructor" which could be simplified in many ways.

"The only difference in field procedure which is advisable when carbon bisulfide is used in a pump machine, is that the refined instead of the crude carbon bisulfide be used. This will necessitate ordering in large quantity from the wholesaler as only the crude article is usually handled by the local dealers. The price is ordinarily about the same, but the refined product will be found much more desirable for pump machines as the crude article ordinarily contains a small amount of free acid which will corrode the vaporizing tank.

"It will be found necessary to vary the dose of carbon bisulfide employed depending on the nature of the country in which the squirrels are located. In foothill sections of shallow soil and hard subsoil, similar to the Berkeley hills, treatments which average half an ounce to a hole will be sufficient if a pump is employed. Where deep valley soils prevail and especially where large colony burrows are found it will be necessary to use two or three times as much carbon bisulfide to secure satisfactory results.

"The laboratory investigations, as well as the field observations of Dixon, show that neither gasoline nor distillate are satisfactory materials for squirrel fumigation. Their effectiveness is so much lower that, as previously stated, even if 20 cents per gallon is paid for gasoline and 90 cents for carbon bisulfide the bisulfide will be found less expensive per squirrel killed. It is believed that the field has been thoroughly canvassed for possible fumigating materials, and with the exception of calcium arsenide, which will require further work to prove its possibilities, carbon bisulfide is the most satisfactory chemical so far developed.

"Intelligent observation and careful work will be found to yield good results at every stage of a squirrel campaign. In the use of fumigating materials it is possible to effect great economy by treating only occupied burrows. The poisoning campaign which precedes the fumigation should have been arranged for the earliest possible date that will find the squirrels actively working in the spring. A week or ten days after the poison has been distributed a workman equipped with a mattock should go over the infested areas and close every visible hole. The fumigators should follow in one or two days. Every hole that is now open will indicate that the burrow is occupied by a squirrel and very few empty holes will be treated by this method. The treated holes will be again closed so a later inspection should clearly indicate whether any squirrels have escaped.

It is too much to expect complete eradication of all squirrels in one or two season's work. California is too widely infested with ground squirrels for such a thing to be possible. A few squirrels will escape in gullies or dry washes. Even under the best possible conditions we must face the necessity of squirrel control just as the orchardist faces an annual outlay for spraying or fumigation. The encouraging thing about squirrel control is that the work will become less and less if it is intelligently performed and thus pay larger and larger returns on the time and materials invested."

HEMET TRACTOR TRAINING SCHOOL

Hemet in Riverside County has been chosen as one of the tractor training centers for the series of schools being conducted by the state board of education and the state board of control cooperating with the local high school. A training school opened January 13 and continue to and including February 1.

The first week of the school will be devoted to a study of gas engines, carburetors, ignition, etc. The work will be in charge of one of the group of experts employed by the state board of education. The second week will be given up to the study of tractors, assembling, disassembling and lubrication.

The third week is spent in a demonstration in the field, the students actually being trained to operate various types of tractors in the preparation of a piece of land for cropping.

These schools have been an unqualified success in other places and it is to be expected that the Hemet school will be no exception. It will be the purpose to enroll farmers and young men out of employment who may be trained to relieve the tractor operator shortage which exists all over the country. The course, however, will be of practical value to every one who operates a gas engine, whether it be in an automobile, pumping plant or tractor. Immediate enrollment is urged upon all who are interested. Full particulars can be obtained by corresponding with Oren B. Waite, principal Hemet Union High School, Hemet.

Smile, and the world smiles with you.
Weep, and you weep alone;
For the good old earth has need of your mirth,
It has sorrow enough of its own.

Concentrate all your thoughts upon the work in hand. The sun's rays do not burn until brought to a focus.

Life is not really what comes to us but what we get out of it.

Champion

Dependable Spark Plugs

Champion Heavy Stone Price $1.25

Avoid Substitutes Look for "Champion" On the Porcelain

A VAST majority of car owners know from experience the wisdom of getting the Champion Spark Plug *especially* designed and recommended for *their* type of car.

For your protection, we suggest this caution—be sure the name "Champion" is *on the porcelain* as well as on the box. If it is not, you know it is not the genuine, dependable Champion Spark Plug.

Most dealers call your attention to the name "Champion" on the porcelain when they recommend this make of plug

There is a Champion Spark Plug for *every* type of motor car, motor truck, tractor, motorcycle and stationary engine.

Champion Spark Plug Company, Toledo, Ohio

Get Your *Irrigated* Farm From the Canadian Pacific

IN a climate not excelled by any agricultural area in America you can own a fine, rich farm of your own. The Canadian Pacific Railway offers you this opportunity to achieve independence and grow rich—in Western Canada. The lands offered are in the largest and most substantial irrigation undertaking in the Continent. The price is only $50 an acre—some for less.

Twenty Years to Pay
You pay down 10% and have 20 years in which to pay the remainder. The first crop is often worth more than the total cost of the lands.

$2,000 Loaned to Farmer
Loans of $2,000 in improvements are made to approved settlers on irrigated farms with no security except the land itself. You can take 20 years to repay this loan at 6% interest.

Irrigation, Crop Insurance
This land is not arid but production can be greatly increased by irrigation. There is an unfailing supply of water which is administered under the direction of the Canadian Government. The provinces have no control over it and there is no conflict of law or authority over its use. The water is free, the only charge being a fee of from 50c to $1.25 per acre for the maintenance of the system and the delivery of the water. Irrigation here is *not* an experiment.

Why an *Irrigated* Farm?
Because irrigation in Southern Alberta
—insures crops every year
—increases crops every year
—makes you practically independent of weather conditions
—produces great quantities of coarse grains, pasture, alfalfa, roots, thus developing the live stock industry which is safer and ultimately more profitable than wheat farming
—tends toward close settlement, well cultivated farms, good neighbors, good roads, schools, churches, telephones, mail delivery, co-operative marketing, and a high standard of community life.

The Opportunity for You
The Canadian Pacific Railway knows that its prosperity depends on the prosperity of the settlers along its lines. Because it wants good settlers it is willing to sell its lands at these remarkable prices and terms.

Send for special railway rates and special booklet fully describing all lands and giving all details.

Try This one man Stump Puller 30 Days FREE!

SEND NO MONEY

Prove all my claims on your own farm! Find out how one man alone with a Kirstin handles biggest stumps. Pulls big, little, green, rotten, low-cut, tap-rooted stumps—Rocks, trees or brush! Does it QUICK! EASY! CHEAP! If satisfied, after 30 days' trial, keep puller. If not satisfied, return at my expense.

No risk to you! Four easy ways to pay.

Single, Double, Triple Power!

Kirstin ONE MAN Stump Puller

Weighs less—costs less! Yet has greater speed, power, strength and **lasts longer!** Made of finest steel. **3 year guarantee against breakage.** Clears acre from one anchor. Pulls stubborn stumps in few minutes at low cost. Single, double, triple power. Several speeds. Low speed to loosen stump—high to yank it out quick. Patented quick "take up" for slack cable. Easily moved around field. No other stump puller like it! All explained in big FREE BOOK. Write for book today! Also for Special Agents' Proposition. Shipment from nearest distributing point saves time and freight. Address me personally.

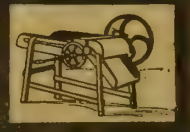
Quick Shipments from Escanaba, Mich. Atlanta, Ga. Soo, Canada Portland, Ore.

A. J. KIRSTIN COMPANY.
309 E. Morrison St., Portland, Oregon.
Gen. Office & Factory: 20 Lud St., Escanaba, Mich.

My Big New Book FREE Post Paid

Tells why a few stumps cost you more EACH YEAR than the price of a Kirstin! Why stumps cost American farmers an appalling toll! Shows how thousands of Kirstin owners pull pesky stumps in spite of labor shortage—with **one-man outfit.**

Also why the Kirstin way is the cheapest, quickest, easiest way to clear land for BIG CROPS.



Book is filled with information every farmer should read. Write for FREE BOOK now—today!

Questions and Answers

ANSWERS BY EDITOR AND STAFF

Questions to be answered in this department should be received at the office one week before reply is expected. Write plainly on one side of the paper and sign full name and address. Unsigned communications receive no attention.

Laying Hens and Rainy Weather

Will you kindly answer through the Cultivator the following questions: Should hens that are expected to lay be allowed to get out mornings on the cold ground in cold rains from off a warm roost, then fed cold dry feed and allowed to drink cold water and stand around in the rain all day? Should not laying hens be fed warm, moist feed in the morning, and not be allowed to stand around on the cold ground, and should they not have warm water to drink and warm sand to stand and wallow in?—Subscriber, Red Bluff.

Moderately cold ground and moderately cold water ought not to check the laying of a vigorous hen, but cold rain is a different matter. Some Eastern poultrymen claim that their hens can run on frosty ground all winter without checking the egg yield. Others do away with yards altogether and keep their hens indoors summer and winter. Whichever side has the best of the argument, cold rain has no advocate, and "standing around" in the rain or out of it has no advocate. Don't let your hens stand around under any circumstances. Make them work if you want eggs. Here again the doctors disagree. Most poultrymen feed a moist mash at some time in the day, some in the morning, some early in the afternoon, some at night. Some like it hot, some like it cold. There are those who say a hen should never have warm feed, while others do not object to a little warming in cold weather. Personally I like the warm mash of cooked vegetables and ground grain and I give it in the morning because it is less trouble for me to attend to it then, but it is a question whether scratching for her breakfast in deep, dry litter won't warm a hen up more effectively than any amount of warm feed. Drinking very cold water is said to check laying, but my own idea is that hens will not drink water that is cold enough to chill them. Certainly they should have fresh water in their crocks every morning. If the water is very cold, it might be well to raise the temperature a little by adding hot water, but I would not make it warmer than the ordinary temperature of piped water. —J. A. K.

Princess Papershell Almonds

In further answer to question as to the Princess Papershell almond in Cultivator R. H. Taylor, assistant professor of pomology at the state universiity writes:

In our opinion the principal reason why the Princess is not grown more than it is, is because of its light bearing habits. Our experience with the Princess at the University Farm, Davis, shows that the Princess is a comparatively light producer as compared with other varieties and particularly so as compared with the Nonpareil. The Nonpareil is a very much better nut in every way and is a much heavier producer, in fact in most years the Princess has not produced much more than half the tonnage. While it is true that the Princess runs a higher proportion of kernel in proportion to whole nut, at the same time the shy bearing does not make up for the difference. By comparing the varieties in Table 11 of Bulletin 297 of this station, "The Almond in California," you will see that the average percentage of kernels to whole nuts for the Princess is 70.6 per cent, this being the average for four years. With the Nonpareil the average is 66.6 per cent Furthermore, the Nonpareil has a somewhat better shaped kernel—more even and with less projections. It is therefore more desirable for shelling purposes. In this connection it might be well to state that all the papershell varieties are valued chiefly for shelling. Another advantage of the Princess over the Nonpareil is the somewhat fewer number of double kernels, the Princess generally running somewhat less than the Nonpareil. The average for three years showed that the percentage of double kernels for the Princess was 1.88 per cent, while for the Nonpareil it was 3.05 per cent. We do not believe that this difference, however, is of sufficient importance to be worth considering. When all is said and done, our opinion is that the chief and only reason why the Princess is not grown more in the state is because of its light yielding habit.

Pumps—Centrifugal and Rotary

Will you kindly tell me which is preferable for irrigating purposes—a centrifugal or a rotary pump? Would a rotary pump dry out if not pumping oil? Is it so much better than a centrifugal that it is worth the higher price? My idea is that a rotary pump is more suitable for pumping oil or wine or for use in ships and that the large irrigating plants use the centrifugal.—Subscriber, El Cajon.

The centrifugal pump is much preferred for all ordinary irrigation work. There is almost always some sand or grit of some kind in water and particularly so when a large volume is pumped and currents formed in the water coming to the pump. Rotary pumps have close fitting surfaces and move slowly, consequently sand destroys them very rapidly, while centrifugal pumps fit loosely in the case and depend on the speed of the runner to throw the water to the desired height. A well made centrifugal pump will handle a large amount of sand in the water without much wear on the pump.—J. B. N.

Pigeon House

Can you give me a sketch for a pigeon house? Have been keeping them in the barn but snakes and cats get at them. I would like to put it on a high pole in the barn yard. How can I arrange it so snakes can reach them? I want a house large enough for eight or ten pair.—Subscriber, Owensmouth.

The pole pigeon houses in my neighborhood are built to house four pair each. If you tried to make one large enough for eight pair, it would be topheavy, I fear. It would be better to build two houses. One of these houses, which I measured, is 25 inches wide by 36 inches long and 13 inches high to the eaves. The corner posts of the frame are of light one by one material and the middle supports (the end ones reach to the gable) are one-half by one. Each side is divided horizontally in the middle by a half inch slat through which are strung coarse wires like those of a bird cage,

Big Seed Company Is Distributing New Catalog

Aggeler & Musser Seed Company of Los Angeles

Issue 26th Annual Book

The Aggeler & Musser Seed Company, the large Seed House of Western America, is distributing broadcast their 1919 Big Annual, which is claimed to be the most complete and finest yet issued.

Among the many new features incorporated is a department on "More and Better Potatoes." Important data is given on Home, School, Field and Demonstration Garden Work. Data concerning correct tools and implements to use for best results. Marketing notes on each subject, telling how and where to market. Hints on poultry, spraying, fertilizing and the use of insecticides. It is in reality several books in one, for it includes the important "Garden Manuel." One thousand questions are answered and valuable information on all varieties of plants is given.

The Aggeler & Musser Seed Company have opened a large store right in the center of shopping district, 620 South Spring Street, Los Angeles, a great convenience to rural customers. A special Call Department has been installed to accommodate customers in town for a short time on business. Orders left on arriving are ready when called for. The big Mail Order Department and General Offices are all situated at the new store, while the general milling, cleaning and warehousing will continue at the big warehouse, Sixth and Alameda. The new catalog explains fully all the new departments and why our service has been improved 100 per cent. Sent free, postpaid, anywhere. Write for copy at once.

running from top to bottom of the house. The gable roof is 18 inches from the floor at the gable, with eaves projecting about five inches. Another house of the same size has its gable 27 inches from the floor, with eaves projecting only three or four inches, so I judge there is no rule about slant of roof or width of eaves. The house is divided into four rooms by a wire partition similar to the outside of the house. Each room has its own perch and nest. A heavy 10x12 post, four and a half to five feet hign, with platform of boards for the house to rest on, keeps it above the heads of most marauders, and the closely wired sides do the rest. Post and platform and roof, which is of shakes, are all painted dark green and the rest of the house white, and a mound of rocks and greenery about the bottom of the post makes it as sightly a bit of poultry equipment as one could wish to see.—J. A. K.

Winter Irrigation

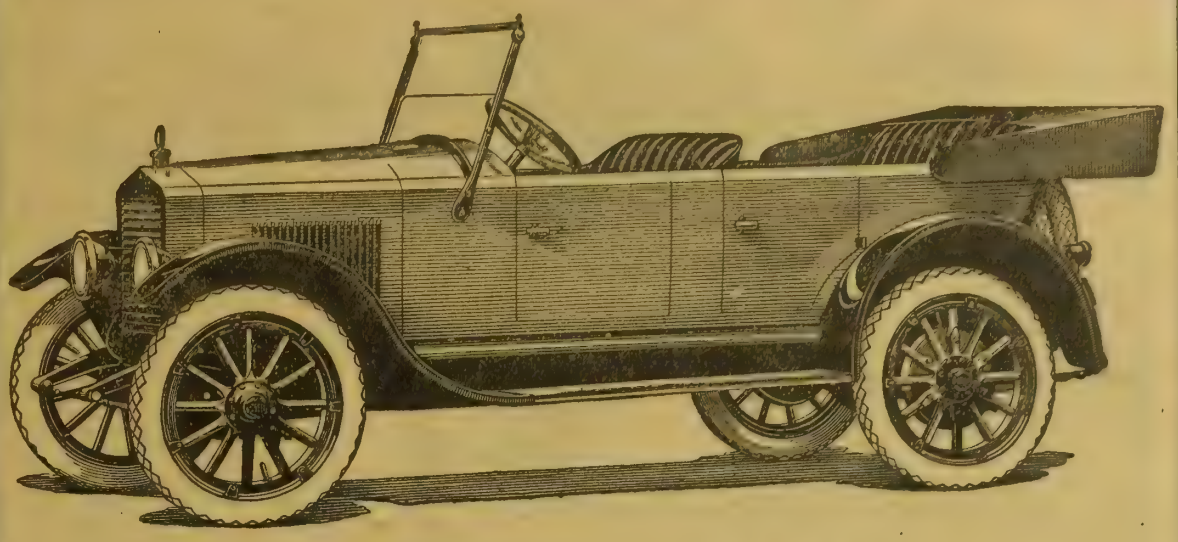
Please say through your valuable paper if peach orchards in Tehama County should not be well watered during winter months or in the fall when fruit has been gathered, regardless of the rainfall.—Subscriber, Los Molinos.

Yes, irrigate. We believe there have been many failures in deciduous crops because of lack of moisture after removal of the fruit and the preventing of the full development of the next year's fruit buds. Of course, there should be reason in irrigation; great quantities of water put on the ground immediately after crop removal and continued until frosty weather—which comes in some peach sections—might result in serious injury to the trees, but we assume the peach grower will use judgment in the matter.

As to winter irrigation, that is, after almost complete dormancy, that is another question and depends upon the section, nature of soil and subsoil and the rainfall. In a year when the rainfall is excessively light, if the soil is retentive of moisture, heavy winter irrigation may store up water which will make a successful crop where otherwise there would be failure.

Aphis or Plant Lice

Will you please tell me through the columns of your paper what to do for plant lice on rose bushes?



Spraying with tobacco extract or with kerosene emulsion is about the only treatment for this pest. However, at this period of the year destroying of all weeds which afford a breeding place for them may keep millions of them from next season's crop.

Hens Molting Twice

I want a little information in regard to my chickens. I have been raising chickens for 20 years but never had the experience I am now having. We moved to Antelope Valley in July. Hens laid well till September, then stopped a couple of weeks and moulted nicely, then began laying and laid well till the second week in December, stopped again and now they are moulting again. Can you or any of your readers tell me why? They have a hot mash of everything in the morning, dry mash during the day and kaffir corn and barley at night, with warm milk and slop to drink. They have not had a variety of green but all the green alfalfa leaves they wanted, a large run and plenty of exercise. Could it be the change in climate? We moved from Covina. Nights it gets pretty cold, almost zero, but days warm and sunny.—Subscriber, Lancaster.

If your hens laid steadily till the second week in December with only a two weeks' vacation in September I don't see that you have anything to complain of. That two weeks was not long enough for the regular moult, which usually lasts about three months. It must have been a slight dropping of feathers due to the excessive heat. Many hens molt twice a year in California and spend a good deal more than two weeks each time. With the excellent ration and care your hens have they will probably molt quickly and soon be laying again. Their molting so late shows that they are unusually good layers.—J. A. K.

Loyalty can't be bought but it won't exist forever on indifferent appreciation.

The Essex—$1395

Light Weight, Durable, Rich in Appointments, Low in Cost, Economical and a Tremendous Performer

Is Now Ready

You are to advertise the Essex.

Instead of our praising it, we wish you to do that. And what you will say is what we want everyone else to think.

Every praise that can be suggested has already been applied to some other car and, as you know, all cars do not come up to the claims made for them.

So the Essex must speak for itself.

It is endorsed and will be sold by the leading automobile dealers in every section of the world.

Dealers of their type do not take on cars about which they have the least doubt. They do not make selling contracts with new and untried organizations.

The Essex Will Endure

A real car must have stability. It must remain rigid and free from squeaks and rattles.

You will see why this is so with the Essex. Hard service cannot loosen the body joints nor twist the radiator.

Be sure this is emphasized by driving over cobblestone pavements or rough roads. Take any speed you like. You will find it a comfortable ride and will marvel that over such a road and at such a speed you are not pitched or bounced about.

Has Economy of the Light Car, Comfort and Endurance of the Costliest

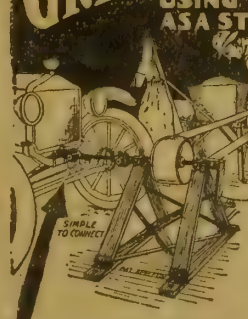
The Essex's motor would inspire a whole season's advertising campaign. A slogan might be written about its beauty.

Its economy of fuel, lubrication and tires appeals to others.

It awakens the pride of ownership. It has dignity that comes from power and poise. It will retain its smoothness and flexibility and quietness throughout long hard service.

The Essex is light in weight and cost. It is rich in detail and refinement.

Everyone says nice things about the Essex.



We Are Not Asking You To Buy Now. Just Ride in the Essex

Only a few cars are available for each territory. The first ones are being distributed so as to reveal their qualities to the greatest number of people. When you see by the newspaper that your dealer is ready with his Essex, go look at it and tell your impressions to your friends.

A Great Record Made by this

GUERNSEY

This four-year-old Guernsey cow boasts a yearly production record of 16,203.90 lbs. of milk and 855.70 lbs. of butter fat. She has been kept in the pink of health. HEALTH pays big in any cow.

Increase Your Milk Income—Sure

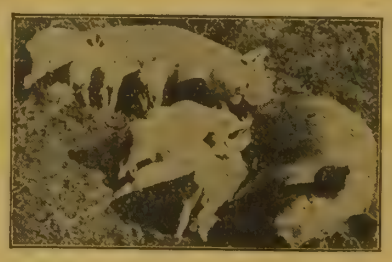
Every cow you own that is less than 100% healthy is losing money for you. And the fact is that 80% of all dairy cows are below a proper health standard.

The vital organs of cows are just as liable to become diseased and sluggish as those of human beings. They need the same kind of treatment—medicinal assistance. Don't make the mistake of overfeeding to bolster up a sluggish system.

KOW-KURE has met with such great popularity among dairymen because it acts directly on the digestive and genital organs, toning them up, making them function properly, and enabling them to throw off disease.

Such ailments as Retained Afterbirth, Barrenness, Abortion, Scouring, Lost Appetite, Bunches and similar troubles, respond quickly to the strengthening influence of KOW-KURE upon the entire system. The result is an almost immediate increase of milk production.

Your druggist or feed dealer sells KOW-KURE, in 60c. and $1.20 packages. Send for our valuable free book,



"The Home Cow Doctor"

It tells how to treat all the most common cow diseases and gives much valuable general information.

The Range Cattle Situation

Written for California Cultivator By A. L. Spellmeyer

FOR some time the keener students of the cattle situation have felt that there were certain unmistakable signs that pointed to a shortage of beef and a consequent higher price.

The general public has been led to believe that the average Western cattleman and sheepman was rolling in wealth. This conclusion was arrived at after a visit to the local retail meat shop—or the restaurant. As a matter of fact and of general interest a brief outline of existing conditions affecting the beef industry may not be out of place, and, at the same time, may serve to enlighten the public.

There are fewer beef cattle in the United States today, than there were a decade ago, notwithstanding the fact that our cattle population shows an increase. Most of the increase has been in dairy stuff, and in view of our increased population, the number of beef cattle, per capita, has shown a decrease.

The big breeding ground for beef cattle may be considered to center in those states commonly counted as constituting the West and Southwest. Roughly speaking about 20,000,000 are in the West and of the number 10,000,000 to 12,000,000 are in the Southwestern states. It is these Southwest cattle that supply the fluctuating and variable number of yearlings and stock cattle that spell plenty or shortage. From the Southwest section are drawn the young cattle for the middle Western and Northwestern feed lots and steer ranges. The Southwest is the real breeding ground. Obviously these conditions seriously affecting the Southwest must in the end rest on the general trade. Let us see how the Southwest has fared during the past few years—say since 1914—and draw our conclusions.

During the past three years, practically every part of the West and Southwest has been hit by drouth. So serious has the drouth been that cattle operations, both large and small, principally small, though, have been forced to cut their herds, and hundreds of thousands have been forced on to the market. In many sections, notably southwest Texas, the govern ment aided in the movement of thousands of cattle to areas where there was feed. This movement accounts, in a large measure for the increased receipts received at the central markets, from which fact many draw the erroneous conclusion of increased numbers. The drift marketward was not confined to steers of good ages, ready for killing—but consisted to a large extent, of breeding cows and young stuff. And in this connection the banker of the Southwest, and the cattle loan companies can be charged with forcing a situation that will result in higher prices to the consumer. Any number of small, and reasonably large cowmen, who were operating on borrowed capital had their loans called when the water holes began to dry up and because they could not secure extensions or increased loans for the purchase of feed or the shipment of their cattle to better grass, were forced to liquidate their entire breeding herds.

This fact alone is sufficient justification for the assumption that higher prices are inevitable. With the breeding herds of the Southwest reduced to a marked degree, what other conclusion can be reached?

But other evidence can be furnished. There are three basic industries, agriculture, live stock and mining. Whenever any one develops a situation wherein little or no profit can be taken, production is restricted. Restricted production means higher prices.

The table on opposite page will perhaps throw some light on the live stock situation and indicate why production has been restricted:

Taking 1914 as a starting point: The cost of cattle operations has shown a steady increase, due to the cost of labor, supplies, etc. It is not too much to say that the cost of producing a yearling steer has increased at least 100 per cent since 1914, but the average price paid the producer has only increased about 15 per cent. There was little profit in yearlings in 1914 and now, with production costs doubled and only a 15 per cent raise in selling prices, can the business stand? In 1914, Arizona cows fetched about $35. There was a gradual increase to about the middle of 1917, but since then, owing to drouth and forced liquidation, they have sold from $24 to $38. The price of meat has increased about 64 per cent and the only class of cattle that has followed the raise has been the older stuff—the threes up—in reality a small percentage of the cattle.

Can any business keep going under such conditions? Is it not inevitable, that, unless better prices are received many men will be forced to cease production? And if supplies are cut, will not higher prices result?

Here is another fact that must not be lost sight of. Owing to good prices on the older stuff, the Northwest ranges—Montana, Wyoming, Colorado —and even the California ranges have been cleaned of heavy steers. I rather imagine that those ranges (judging from the stuff one sees at the Eastern yards), have been literally combed and dry cleaned of everything with a bit of age. Those ranges will clamor for yearlings next spring—and a lot of cows will be wanted.

Figure the situation from any standpoint and one must conclude that better times are in store for the cowman. If better times do not materialize then the average cow outfit must go out of business.

With a world shortage of food it is to the interest of all that the business be standardized as quickly as possible. The banker and the loan company must adopt a more liberal and rational policy toward cattle paper. The packers must pay all that the stuff is worth.

I believe that good times are ahead. I believe that the $100 cow is on the way and I would not be suprised to see $50 yearlings at Phoenix and 15 cent beef at the same point and yet, there is a possibility of beef reaching the point when consumption will be curtailed. In which case, the situation would be about as unfortunate as the present. What is really needed is a sane, liberal attitude on the part of those interests that control the cattle industry—the packers and the cattle loan companies, whereby the cowman can secure long time loans at let-live rates, in order that he can expand his operation. Assured of operating capital and a fair market for his stuff he can be depended on to deliver the beef—but he is human. With such a policy on the part of those interests and a broad constructive policy on the part of the government in matters of ranges — encouraging better methods of grazing, water development, fencing, range control, more and better bulls, the consumer can be assured of an adequate supply of beef at prices he can afford to pay.

POST-BELLUM MEAT PROBLEMS

ONE of the most illuminating articles regarding the problems that face the meat producers of this country that has appeared since the signing of the armistice was published in the Christmas number of the Breeders' Gazette and is from the pen of Jonas E. Poole, perhaps the keenest student of live stock markets in this country. Mr. Poole discusses the question from a world wide viewpoint and much that he says will be of high interest to many of our readers. The writer starts with the assumption that "all we know to a certainty is that four years of drouth, destruction and disease have so depleted the world's food supply that a large section of the human family is confronted with famine," and that "herds and flocks have been seriously depleted will not be disputed, cloven footed animals having disappeared from a large section of Europe, but what the world's food requirements during the next half decade, or even the ensuing year, may be, measured by ability to pay, is a knotty problem.

"That Europe will need a vast quantity of beef and pork during the post-bellum period is a certainty, and it is equally certain that the latter must be supplied by the United States. Other sources of supply of beef and mutton exist; how abundant or accessible they may be has yet to be determined. During the war period South America contributed a heavy but gradually diminishing supply of beef to Europe, and Australia was mainly responsible for rationing military forces in Asia, Africa and southern Europe with beef. Mutton accumulated in freezers, owing to its perishable character, and represents the major part of the stock in Australia and New Zealand. North America is without an accumulation.

"During the war live stock production has not been maintained at normal volume anywhere. The extent of depletion in Europe is naturally conjectural, and even in the United States nothing of a reliable statistical nature except actual slaughter is available. So far as Mexico is concerned, we know that the industry has been ruined, Canada has contributed heavily to the support of the British army, and in the early stage of the war was forced to liquidate cattle for financial reasons, drouth in the west this year giving the industry an additional setback. In the United States only the hog has multiplied under the stimulus of remunerative prices.

"From the Rio Grande to the Saskatchewan and the Missouri River to the Pacific Coast drouth has played havoc with the cattle industry, materially reducing the southwestern calf crop for three successive seasons, forcing cows and young cattle to the shambles by the hundred thousand, and dispersing others where they will be less available commercially. Aged cattle have all but disappeared. Replenishing pastures and defilling feedlots are constantly becoming more difficult and expensive, and while cattle receipts at the primary markets in the United States this year warrant the conclusion that beef plentitude actually exists a survey of the contents of any stockyard demonstrates that the figures actually mean depletion. High prices always exert a magnetic influence, and if this year's gathering has not cleaned up the surplus cattle of the country, many in the trade are guessing wrong. The sheep industry has also been hit by drouth, arresting expansion at a moment when energy and capital were being devoted to a rehabilitation campaign."

In speculating on the world's meat requirements Poole is of the opinion that many of the estimates have overshot the mark, owing to the fact that, of necessity, Europe must continue on an extremely economical plan of living. Commenting on the fact that fats will undoubtedly be needed, he points to the large accumulation of vegetable fats that will find an outlet through domestic consumption.

As regards the probable sources of meat supplies he states that the British government "began a survey of the world's beef prospects more than a year ago, taking measures to stimulate cattle production in its colonial possessions, and provide facilities for conversion and transportation. American packers, equally alert, have spent millions on "meat works" in South America and Australia, so that the maximum production capacity of the

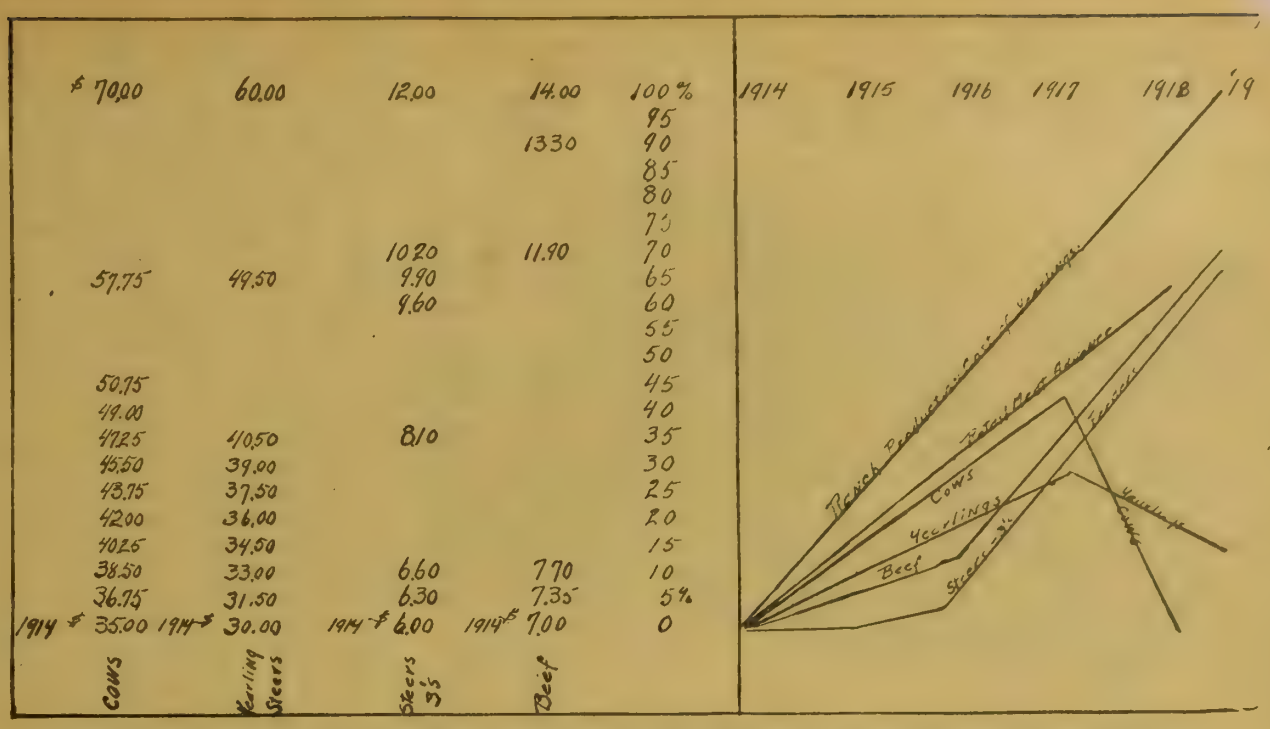

Chart Showing Production Cost, Meat Advance, and Trend of Prices on Cows, Yearlings, Beef and Steers

Production expense increase 1914-1919, 100 per cent. Price increase yearling steers 15 per cent. Three year feeders 60 per cent. Price decrease range cows shipped 1914-1919, 20 per cent. These figures can be approximately established as can production expenses by grazing fees and actual cost on ranches, including labor, etc. Meat advance is taken from printed resume of government report and beef advance from figures in advertisements. Feeder steer prices, yearling steer prices and cow prices are based on sales, shipments and purchases from 1914 to 1919 of over 100,000 cattle and approximated as closely as possible.

SANDERS-BRADSHAW GREATEST HOLSTEIN SALE

Sale will be held under big tent

State Fair Grounds, Phoenix, Arizona, February 5, 6, 7

Owing to large number sold, great opportunity is offered. Cotton growing in the Salt River Valley has made cattle cheaper than other sections, and Pacific Coast breeders and dairymen will do well to attend this sale, because cattle of splendid breeding will be sold.

Special Feature of Sale

Large Number of Heavy Milking Cows

Some of the Peaches and Cream of the state—include, a bull whose three nearest dams average 33.02 butter, seven days.

A bull whose seven nearest dams average 32.26 and who is a son of the famous sire, King Segis P. Alcartra.

A two year old son of the 27 pound two year old daughter of Johanna McKinley Segis.

175 Registered Holsteins

100 High Grade Holsteins

The Grand Champion Show Cow: Frontier Mona Korndyke, butter 22.78, milk 551, seven days.

Many other excellent show animals.
Many A. R. O. cows.
Many daughters of 36 pound bull.
Many daughters of 32 pound bull.
Many daughters of a bull who has 43 A. R. O. daughters.
Numerous daughters of two 30 pound sons of King Segis Pontiac.
Numerous daughters of a grandson of Aralia De Kol.
Nearly all females of breeding age are in calf, to a full brother of King Segis Pontiac Count, whose two nearest dams average 1146 pounds butter one year, or a son of King Segis Pontiac, and the 30 pound cow, Pear Ormsby Burke.

Blood lines of this entire sale are close to the greatest record cows and bulls of the breed. Cattle of this section are notably free from tuberculosis. and are tuberculin tested, by State Authorities.

As a special inducement, individuals whose purchases exceed 15 head will have freight paid to destination of purchaser.

Do Not Miss This Greatest Sale of the Southwest. For illustrated circulars and catalogue address:

world will become available during the next five years. To what extent cattle raising is possible in South Africa is open to conjecture. South America's temperate and semitropical zones are doubtless susceptible of successful exploitation. Venezuela, Paraguay, Brazil and even Columbia possessing vast areas of unutilized grass, and only the freak climate of Australia prevents that continent from adding materially to the world's supply.

"Russia is an unknown quantity, information concerning its cattle industry being contradictory; but the consensus of opinion suggests that years must elapse before it can become an exporter."

On the North American continent both Mexico and Canada are beef production prospects.

"But before domestic cattle production can become normal, the depleted breeding ground of the southwest must be restocked, and other drouth-devastated sections replenished, especially the steer pasture. Even the mountain regions where drouth has not necessitated liquidation have responded to the lure of prices, shipping cattle of all ages and both sexes, on the theory that taking a profit never invited bankruptcy. The domestic cattle industry has reached a stage where further decimation will spell serious beef shortage."

It is certain that the United States will be called on to supply the world's need of pork as this country is the only exporter of pork and pork products, but "that present volume can be maintained after Europe resumes pig growing is impossible.

"Pig culture in Europe will be speedily reinstated when feeds are imported, and it is possible that if the present volume is maintained by American farmers a period of relatively low prices will ensue. The South has been putting the hog on its map, and outside the cornbelt interest in swine in a commercial sense is not concealed, high prices being a logical stimulus. The impending shortage of beef will necessitate heavier pork consumption, and as it is the 'poor man's meat' industrial prosperity will work to its distinct advantage, while depression would not prove a serious handicap. It is axiomatic that the size of the hog crop is measured by that of the corn crop, the health of the species being also an important factor.

"Growers will realize, however, that the 1919 pig crop will in all probability go on an unprotected market with a possibility of contraction of export trade, and the certainty of the practical elimination of military consumption.

"War has not benefited the sheep grower except to the extent that wool participated in abnormal prices. No export outlet developed, and little mutton was used by the navy and none by the army. Had the excess range lamb production of 1918 been utilized for training camp purposes, the strain on an inadequate beef supply at that juncture would have been relieved, and much loss to growers averted. From the inception of America's entry into the war, when the eat no lamb propaganda demoralized the market, until now, the industry has encountered adversity. No prospect of an export outlet exists, and domestic consumption is centered in a few large urban centers, notably New York, Philadelphia and Boston. The danger of excessive production of lamb exists until a broader market has been developed, that task being a formidable one.

"Reference to prices will demonstrate that neither sheep nor lamb has the benefit of war demand, only a handful of heavy mutton being wanted.

"Western wool growers, marketing their clips in large packages, have derived full benefit from the government valuation system, but farmers with small flocks have not realized what was logically coming to them, as they marketed through the medium of dealers who in many cases ignored regulations as to profits. The war industries board proposes to enforce restitution, but this will not solace the farm flock owner whose account was too small to identify."

In concluding, Poole takes a broad view and says that "in common with other industries live stock must accept whatever penalties reconstruction imposes. War prices are naturally ephemeral, and readjustment in a downward direction can only be a matter of time. Labor may cherish the futile hope of retaining what it has gained, but cattle, hog and sheep raisers entertain no such fallacious ideas; in fact, there has been a disposition to take a pessimistic view of the outlook, as indicated by premature marketing during the armistice period. That both domestic and European requirements will be heavy for months to come is as indisputable as that government influence on prices will steadily wane, its purchasing power ultimately ceasing to exert an influence on values.

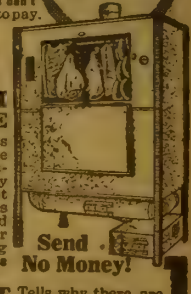
"With the profiteer in leash, industry not seriously impaired, labor fairly prosperous and the abnormalities of the war period with regard to prices and restricted consumption remedied, the position of the producer should continue satisfactory. The element of risk incidental to finishing operations is inseparable from the business, but unwise speculation may be avoided, and neither the present nor the immediate future is a period warranting biting off more than the operator can masticate. It is a time for conservatism, a policy that will doubtless be general.

"The history of the live stock business shows that while it does not present a short cut to opulence, those who consistently follow a system get reasonably satisfactory results, while the in and out element rarely hits the mark at which it shoots. Those who have stuck to cattle, hogs or sheep during depressions, conducting their business intelligently and keeping abreast of the times with respect to production economy, have averaged the same measure of success as the efficient element in other industries.

"For the immediate future it is a reasonable prediction that the supply of fed cattle during the next six months will be considerably less than in 1918, cottonseed products being scarce, a large section of the cornbelt short of feeders impatient to cash. Although the hog crop is 10 to 25 per cent in excess of last year, according to locality, it is being marketed at light weight, and will probably produce less tonnage than the last. The winter production of lamb and mutton promises to be 40 per cent less than last winter, Colorado being the principal delinquent.

"The possibilities are that England will steadily reduce beef purchases in the United States after the lapse of sixty to ninety days, when the Southern hemisphere accumulation becomes accessible, but will buy bacon in enormous quantities for at least a year, if not longer. Germany will take lard when the blockade is lifted, probably purchasing through the food administration. Belgium, Italy, Holland and the Scandinavian countries will need hog products and Russia may be included in the scope of distribution. That Europe will be under the necessity of securing breeding stock in the United States is highly probable, inquiry of that nature having already been made."

I'll Send You My Smoke House



When it arrives, try it out on your own meat or fish for 30 days. See what a wonderful fire-proof, sanitary, combined Smoke House and Meat Storehouse it is. If satisfied, keep it. If not pleased, return at my expense. You don't risk a penny. Four easy ways to pay.

on 30 Days FREE Trial!

PORK PRICES

MORE hearty spirit of cooperation between packer and producer could hardly be found than that expressed at the meeting in San Francisco last week between officials of the food administration, the California Swine Breeders' Association and the licensed packers of California.

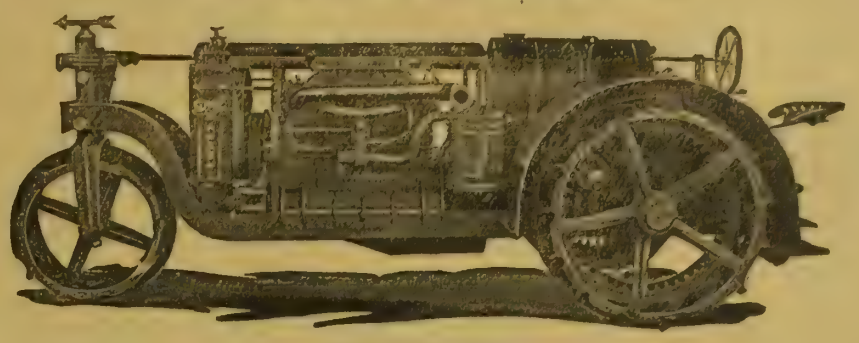
Without any intimation as to what the Chicago minimum will be for the month of February the California packers readily acquiesced in the agreement which will make the California minimum one cent below Chicago next month. Beyond the month of February it is practically impossible to attempt to state the price of pork. It had not been planned to have the packers agree at this meeting to a minimum price for all pigs farrowed during 1919. Were there any positive guarantee that the federal food administration would be continued in office until this year's pig crop were disposed of such a guarantee might have been possible to arrange.

The food administration is keeping up the price of pigs in the Middle West by stimulating the market with higher prices for government orders than would ordinarily exist under the old rule of supply and demand. Were these government orders to cease the pig market in the Middle West would become demoralized and it would naturally affect the Pacific Coast. The food administration is paying these prices in order to keep faith with the hog men of the country who responded to the urgent call to produce more pigs.

California producers were commended by the packers for the better quality and finish of porkers that they are now sending to market and were told that it is possible to put up hams and bacons that are not to be excelled by even the fancy cured hams and bacons from the corn belt hogs. The country auction plan of selling pork hogs was endorsed by the leading California packers represented at the meeting.

While the greater part of the meeting was taken up with the discussion of the pork market, considerable time was devoted to a round table talk on the beef situation. The encouragement given the pork producers for putting a more finished article on the market was practically just the opposite from what was given the beef cattle men who were as much as informed that it made no difference whether they put a grass fed steer on the market or a grain finished bullock. They were given practically the same price for one as they were for the other.

This was explained by F. L. Washburn of the Western Meat Company and Mr. Scott of the Cudahy Packing Company of Los Angeles by the fact that the West has no market for real good beef. The top price of steers on the Chicago market represents the choice beef that goes to first class hotels throughout the East and Middle West, explained Washburn. Such stuff as that we cannot possibly sell on this coast at similar prices because our leading eating establishments will not pay the price for this sort of beef. Not until California and the West has a market recognizing quality can we afford to anywhere near reach the price offered for the Chicago tops.



Scott explained that there had been a greater running of cows to market than of steers during the past several months, and that it was on the cows that the packers were able to make a little money, whereas, he asserted, they had not been able to better than break even on the steers. People will simply not pay the high price for meat, and through lack of discriminating knowledge will just as soon buy cow meat as steer meat. In fact, as Scott explained, one of the leading Los Angeles hotels, the cuisine of which has quite an enviable reputation, has been serving first class cow meat instead of steer meat.

While the packers attempted to discourage the cattle men from shipping their good steers out of the state, they had little or no solution to offer for absorbing the surplus run through the months of May to August. Several cattle men related their experiences in shipping train loads of stock to Kansas City, some of which efforts were disastrous while others were fortunate in loading their stock on a rising market and making money thereby.

GMC TRACTORS

SAMSON SIEVE-GRIP TRACTOR

GMC TRACTORS

MODEL S-25

The durable tractor is not achieved in a day. Many features, time and experience dictate, enter into its construction.

After nearly two decades of manufacturing and field experience, the GMC SAMSON SIEVE-GRIP TRACTOR is submitted as ideal durability. Many in successful operation for years, and in as effective use today, testify to its ruggedness.

The quality of the GMC SAMSON SIEVE-GRIP TRACTOR is guaranteed before built by careful selection of high-grade materials, made to specifications and over-sized to secure liberal reserve strength. Final severe tests further assure a durable product. It is built SAMSON in name and SAMSON in strength.

The GMC SAMSON SIEVE-GRIP TRACTOR performs the work of ten horses on the farm. It will do your plowing, discing and harrowing economically and efficiently, without packing the ground. It is adapted to countless other uses on the farm for many of which horses are unsuited. It will CUT YOUR COSTS. IT WILL INCREASE YOUR INCOME.

The durable is the efficient, economical tractor.

Our booklet, Better Farming, is yours for the asking.

McQuay-Norris Manufacturing Co.
2834 Locust St. St. Louis, U. S. A.

McQUAY-NORRIS Superoyl RINGS

A special ring for engines that pump oil. Used in top groove only of pistons to control excess oil, with McQuay-Norris LEAK-PROOF Rings in lower grooves to insure maximum compression and fuel economy.

Western Canada's "Horn of Plenty" Offers You Health & Wealth

Western Canada for years has helped to feed the world—the same responsibility of production still rests upon her. While high prices for Grain, Cattle and Sheep are sure to remain, price of land is much below its value.

Land capable of yielding 20 to 45 bushels of wheat to the acre can be had on easy terms at from $15 to $30 per acre—good grazing land at much less.

Many farms paid for from a single year's crop. Raising cattle, sheep and hogs brings equal success. The Government encourages farming and stock raising. Railway and Land Co's. offer unusual inducements to Home Seekers. Farms may be stocked by loans at moderate interest. Western Canada offers low taxation, good markets and shipping; free schools, churches and healthful climate.

For particulars as to reduced railway rates, location of land, illustrated literature, etc., apply to Supt. of Immig., Ottawa, Can., or

GILBERT ROCHE

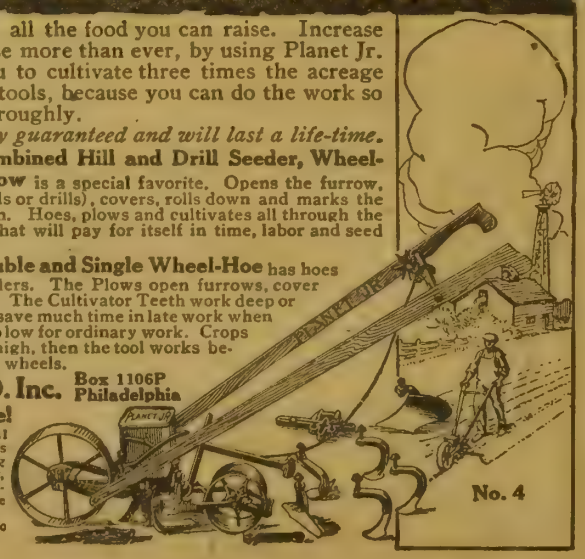
WESTERN CANADA Farm Lands at Low Prices The Wheat Belt of America



Cultivate triple acreage with Planet Jr. tools

Your country needs all the food you can raise. Increase your production. Raise more than ever, by using Planet Jr. tools. They enable you to cultivate three times the acreage possible with ordinary tools, because you can do the work so easily, quickly and thoroughly.

Planet Jrs. are fully guaranteed and will last a life-time.

No. 4 Planet Jr. Combined Hill and Drill Seeder, Wheel-Hoe, Cultivator and Plow is a special favorite. Opens the furrow, sows all garden seeds (in hills or drills), covers, rolls down and marks the next row all at one operation. Hoes, plows and cultivates all through the season. A hand machine that will pay for itself in time, labor and seed saved in a single season.

No. 12 Planet Jr. Double and Single Wheel-Hoe has hoes that are wonderful weed killers. The Plows open furrows, cover them and hill growing crops. The Cultivator Teeth work deep or shallow. The Leaf Lifters save much time in late work when plants are large or leaves too low for ordinary work. Crops are straddled till 20 inches high, then the tool works between rows with one or two wheels.

Agencies in all principal Pacific Coast cities.

EXPENSE OF SHEEP

We have an itemized statement from a firm of California woolgrowers showing in the minutest detail the cost of running a ewe in California. The total expense is $9.37 per year per ewe, but this does not include interest on investment in the ewe. Operating interest is included at seven and one-half cents per ewe, which is simply the interest on money borrowed to meet running expenses. So under this item interest is only charged on 90 cents of investment. An interesting point in this statement is the item of labor, which totals $3.69 per ewe which we imagine is not far from the cost in most well regulated establishments. The sales of mutton and lamb from this outfit were within $1000 of being equal. The actual cost of producing a pound of wood in this outfit was 52.7 cents. As we are personally acquainted with this firm we know it to be the most efficient for its size in the West and we doubt if any other sheep outfit makes as good a showing. The itemized costs per ewe were as follows:

Provisions	$ .774
Payroll	2.97
Road and travel expense	.144
Hay and grain for sheep	.336
Stock sale	.036
Shearing	.22
Taxes	.60
Administration and supt.	.72
Auto expense	.20
Bounty	.04
Breeding expense	.36
Equipment upkeep and depr'c't'n	.25
Feed and pasture	1.64
Freight	.25
General expense	.244
Horse feed	.26
Insurance	.11
Operating interest	.076
Livery and feed	.022
Office expense	.124
Total	$9.376

—National Woolgrower.

CATTLE OWNERS MAY BE INDEMNIFIED

The 1919 agricultural appropriation bill recently passed by Congress contains a provision for the payment of an indemnity to owners of cattle that are slaughtered because of tuberculosis.

The department of agriculture is to pay one-third of the difference between the appraised value of the cattle and the salvage value of the slaughtered animals, provided that the state, county or municipality in which the cattle are owned and kept is cooperating in the tuberculosis work and pays at least an equal amount to the owner. In no case is the federal government to pay more to the owner than is paid by the state, county or municipality. No payment by the federal government is to be more than $25 for any grade animal or more than $50 for any pure bred animal, and no payment is to be made unless the owner has complied with all quarantine regulations.

A FOUR-COUNTY DAIRY COW CONTEST

The Sacramento Cow Testing Association, embracing Sacramento, San Joaquin, Yolo and Solano Counties, has arranged for a dairy cow contest modeled after the state dairy cow competition conducted by the university from 1916 to 1918.

The Sacramento Bee states that the following classes have been agreed upon:

Class A—Herds of from one to twenty cows.

Class B—Herds of from 21 to 50 cows.

Class C—Herds having more than 50 cows.

There will be a separate prize for each herd headed by a grade sire for each of the above named classes.

Two prizes will be offered for the highest cows under five years of age and two prizes for the highest cow more than five years of age making the highest record for the year. These classes will be open to all animals, registered or not.

For grade herds there will be a monthly prize offered for a group of five cows. Cows which have once won this prize are barred from further competition.

In addition to the above prizes there will be a cup offered for the best yearly record herd. The cup must be won three times before becoming the property of member.

Over $400 in prizes will be offered.

DAIRY LAW NEEDS AMENDING

Sam'l E. Watson, secretary of the California Dairy Association, is sending out a bulletin announcing that an effort will be made to have the legislature amend section 18 of the state dairy law so that it will be impossible for state institutions to serve oleo in place of butter.

It was thought that section 18, which reads, "No butter or cheese not made wholly from pure milk or cream, salt and harmless coloring matter, shall be used in any of the charitable or penal institutions that receive assistance from the state," covered the case in point, but in a recent decision by United States Attorney General Webb the opinion was expressed that oleomargarine was not controlled by that section.

As a consequence of that opinion the state purchasing agent on October 2, 1918, directed that all state institutions serve oleo instead of butter.

GEORGE JUNIOR REPUBLIC COWS ON TEST

R. A. Condee of the George Junior Republic, Chino, reports that several of their Holsteins now on semi-official test are going strong and some very creditable records are expected. Two cows, just completing the first three months of their test, have each produced over 7000 pounds milk and 220 pounds butter fat. The test cows are being handled by J. A. Bailey, a boy citizen of the Republic.

Mr. Condee states that the Duroc herd is developing nicely and that they expect to be out strong at the 1919 fairs.

SUBSTITUTING HIGH BRED FOR HYBRID

In a campaign to retire scrub bulls from the herds of the state, seven Wisconsin counties have made plans to follow the example of Fond du Lac County, which in one month placed 43 pure bred sires on farms, 38 going to herds that never before had had pure bred sires. The drive against scrub sires was started at the December conference of Wisconsin county agents, and is in charge of a "steering committee" representing the extension service, the state college of agriculture, leading stockmen, and officials of farmers' organizations. Breeders believe that the elimination of the scrub and grade sire will greatly improve their markets, and appreciate that out of state buyers visiting Wisconsin for dairy cows insist on stock sired by pure bred bulls.

PRESIDENT FAVORS RESUMPTION OF HIGHWAY CONSTRUCTION

President Wilson favors the earliest possible resumption and extension of highway construction under the federal aid road act and has written Secretary of Agriculture Houston to that effect. The secretary of war also has written the secretary of agriculture in favor of highway work.

Smilo Grass

For Ranges and Non-Irrigated Land

A forage plant especially suitable for hills and barren spots to increase the grazing value of the range. Will grow on semi-desert land or on dry hills among rocks and brush where no other grass will grow. Once established it seeds itself down and spreads rapidly.

Smilo Grass is a hardy perennial bunch grass, greatly relished by stock. Is not an experiment but a proven forage plant endorsed by leading stockmen and recommended by the University of California. Sow one-quarter pound per acre. Price 50 cents ounce, $1.00 quarter pound, $3.00 pound.

BLIND MAN MAKES POULTRY PAY

A Cultivator field man, Mr Niles, says:

W. P. Wallace near Escondido has a chicken ranch with 3000 laying hens, has 35 houses and yards. He does all the work of feeding and attending them although totally blind. When incubators are running he has to have someone read the thermomstat; otherwise he attends all baby chicks. He has wires stretched from pen to pen and gets around by means of them. "If a blind man can do that and make money why can't a man with two good eyes?" he asks.

MR. PLANTER:

The coming season promises to be the most favorable in many years for orchard planting. With such a season and

First Class Trees

a successful start for a profitable orchard is assured. WE GUARANTEE OUR STOCK — BETTER CANNOT BE HAD ANYWHERE AT ANY PRICE.

Our Specialties:

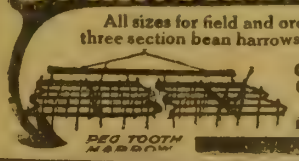
FRENCH PRUNES on all roots grown from carefully selected bearing trees unsurpassed for size and quantity of fruit.

PEAK'S CLING PEACH, in great demand by canners; ripens between Tuscan and Phillips and is fully equal to those old stand-bys in quality and productiveness.

KNOBEL APRICOT, an improved Blenheim; larger fruit and a heavier, more dependable bearer.

JAPANESE PERSIMMONS "Made in America." These home-grown trees live as readily as other fruit trees and are true to name; of the imported trees the few which live are usually untrue.

A Full Line



of all that is best in Fruit, Nut and Ornamental Trees, Vines and Plants; and our prices are very low as compared with other commodities. Write for our Price List; free.

Flush Cows After Calving

Protect your herd against Contagious Abortion and Barrenness.

Barrenness or Sterility, like Abortion, Retention of After-birth and Premature Birth, is nearly always caused by infection of the reproductive organs by the germs of Contagious Abortion. Unless this infection is promptly overcome by the use of a powerful but safe antiseptic, it may permanently affect the reproductive organs so that the cow will continually fail to stick.

Every time a cow drops a calf—whether alive or dead—by premature birth or aborting, whether the after-birth is retained or not, her reproductive organs should be flushed out, because that is where the infection is developing.

B-K, the powerful non-poisonous antiseptic, is scientifically correct for this work Used as a douche for the uterus, it quickly brings the after-birth, dissolves the slimy albuminous matter, kills the germs, stops discharges and controls the infection. B-K does not cause straining, but is soothing and heals the tissues.

Send for "evidence" and free Bulletin No. 52 "Contagious Abortion." If your dealer does not have B-K send us his name

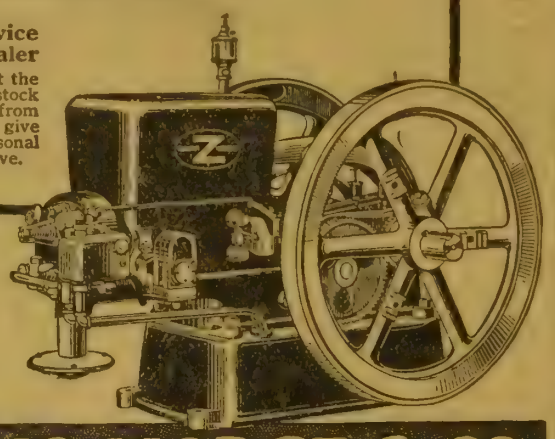
The Engine Selected by over 150,000 Farmers



RECORDS made by over 150,000 practical farmers buying over $10,000,000 worth of Fairbanks-Morse "Z" Farm Engines have never been equaled in Engine history.

Demand, as they did:

1. Fairbanks-Morse Quality.
2. Economy in first and fuel cost, and low upkeep.
3. Simplicity and Staunch Durability.
4. Light-weight, Substantial, Fool-proof.
5. Gun-barrel Cylinder Bore.
6. Leak-proof Compression.
7. Complete with Built-in Magneto.
8. More than Rated Power.

You Also Get Service from your Local Dealer

Your local dealer has just the type "Z" for your needs in stock—waiting for you. Buy from him. He is prepared to give prompt delivery and personal service right where you live.

The 3 and 6 H. P. sizes are built to use kerosene, distillate, stove oil, tops or gasoline. The 1½ H.P. size uses gasoline only.

Successful Cooperation

SUCCESSFUL cooperative organization does not necessarily receive universal approval. While we are not naturally pessimistic, it is hard for most of us to conceive of paradise without some earthborn creature who will do some kicking. In fact, we are not certain but a little knocking on the outside is proof of the worth of some of our cooperative organizations. Primarily the objector to any honestly managed cooperative organization does his kicking because of lack of fullest appreciation of all the facts. There is no successful cooperative organization whose membership is not intelligent enough to take all the facts in the case and do some common sense thinking.

The Poultry Producers of Southern California, Inc. is such an organization, and knowing the disposition of its members and their determination to know the inside facts, it has issued statements to give such inside information. One of the latest of these is a "questionnaire."

It consists of a series of questions and answers somewhat along the line of the old-time catechism. The first answer gives reply to the question as to what is the Poultry Producers of Southern California, Inc.?—

An organization of Southern California poultrymen, incorporated under the laws of California, and conducted along cooperative lines by the poultrymen themselves, with the endorsement and cooperation of the state of California, extended through the state market director, the Hon. Harris Weinstock, whose representative serves upon its board of directors and executive committee.

Its purpose?—To enable the poultryman to obtain for his product a reasonable return for his labor and investment, and a price reasonably proportionate to the cost of production.

Other facts brought out by the questions and their answers, greatly condensed are:

As to price of eggs: Prices of any product are fixed by the law of supply and demand in the markets of the world. If the price drops below the cost of production, production necessarily is curtailed until prices are readjusted to give the producer a reasonable return on his labor and investment. If too high, either the public ceases to buy, or others undertake to produce until prices are likewise readjusted.

If prices of eggs are established under a fixed law of supply and demand, then why cannot the individual poultryman always realize the fair market price?

1. Ability to Market:—The individual producer cannot take advantage of the world markets, but must market his eggs close to his own poultry ranch.

2. Storage of Eggs:—A surplus of eggs for the home market is produced during certain seasons of the year, and must be carried in storage to supply the public during periods of limited production. This, the individual poultryman cannot do to advantage.

3. Speculation in Eggs:—The price of eggs in the home market is naturally depressed during the period of over production. A dealer or speculator will always endeavor to procure eggs at the lowest price and sell at the highest. To accomplish this purpose, the quotations in a given locality will be artificially inflated or depressed to an extent which will enable the dealer and speculator, individually or collectively, to control the market in which he deals. Everyone has heard of the various attempts to corner wheat and other food products. The same thing is being done in the local markets on a lesser scale every year.

How can the individual poultryman always secure the fair market price of his eggs? Only through cooperation.

The advantages of a cooperative organization are: — Extension of Markets:—Made possible by an increased volume of business. Those engaged in marketing on a large scale are thereby enabled to seek the world's best markets. This, the individual producer cannot do but his organization can, and can thereby compete in the world's markets with the dealer and speculator, the only difference being that the cooperative organization does not artificially manipulate markets, and returns all of the profit to the producer, while the dealer or speculator retains all that he can for himself.

2. Storage of Eggs:—Your organization purchases all of the eggs produced by its members during all seasons of the year. It pays the market price, but in addition thereto, you also, as stockholders, receive all the storage profits. Did a dealer or speculator ever offer to return to the producers all of the profits on storage eggs? If so, when?

3. Elimination of Speculation:—The large volume handled by the producers' organization takes away from the speculator the ability to control the local markets and artificially manipulate prices, thereby benefiting all poultrymen, whether members of the organization or not.

Why should I join and lose two cents deducted for operating cost?

1. Because you should do your share in supporting the local market for your product, and should not dispose of your eggs where they can be made use of to manipulate the local market for the benefit of the speculator, and to the detriment of all producers. It makes little difference what premium you receive above the local market if that market is below your cost of production, as was the case for years before the formation of this organization.

2. Assuming that certain dealers pay a premium on "Extras," still a member of this association is "ahead of the game" when he considers the return for off grades, storage profits, and the advantages which are sure to come in the buying of feed and supplies.

3. The marketing of broilers can be made to bring the poultryman a profit, instead of a loss, provided you enable your organization to handle broilers, in sufficient quantities to ship to foreign markets, and this can be done only by cooperation in large numbers.

4. The changing conditions which all productive industries are soon to face will call for a thorough study of marketing methods, and possibly some legislation as to imports, etc., and only by means of a large and strong organization can we hope to compete with producers of other products who are boosting for themselves.

Is it not a fact that you can make a better showing by devoting your entire energies to increasing the average of your flock, and leaving the large question of better marketing to a strong organization that can and will secure the best possible results by constant attention to the many details which make for success?

If it is your desire that this organization may succeed in its efforts to secure for every producer that return to which he is entitled, and if you wish to "do your bit" in making that success certain, join hands with your fellow-producers in an association organized by poultrymen for the benefit of poultrymen.

Membership in the Poultry Producers may be secured by subscribing for one share of stock costing $10 for each thousand hens owned. The stockholder must also agree to the deduction of a cent per dozen eggs delivered for purchase of additional stock should such reduction appear advisable by the directors. The member must also sign sale agreement and contribute from eggs delivered sufficient to pay for handling the business of the organization. Payments are made weekly.

Naturally, there are some drawbacks to such an organization, hence, why become a member?

DECEMBER REPORT OF EIGHTH NATIONAL EGG LAYING CONTEST

By T. W. Noland, Director

Mountain Grove, Missouri. — All previous records for the month of December were beaten this year. The pullets averaged 12.54 eggs each, the highest former December average being ten eggs each.

The two highest pens for December, as well as the high hen, were Buff Orpingtons. A station pen No. 36, Buff Orpingtons, made the highest record by laying 120 eggs, but as they do not compete for the prizes, Pen No. 35

owned by Wm. C. McGlasson of Springfield, Missouri, wins the cup with a record of 115 eggs. This pen also won the cup for November.

A Buff Orpington pullet, No. 33-1, owned by Miss S. C. Fellows of Springfield, Missouri, made a perfect record for December by laying 31 eggs in 31 days.

Six pens out of the 15 breeds and varieties laid 100 eggs each during the month.

R. I. Whites made the highest average for the month, the 20 pullets averaging 1855 eggs—sales value 93 cents or $19.55 for the 20 pullets. This does not include feed.

Our feed has been changed from the war-time ration by adding 50 per cent wheat to our grain ration instead of feeding straight cracked corn as a grain feed, and by feeding moistened mash twice each day—in the morning and the early afternoon. Feed at night all the grain the birds will clean up and feed the grain early enough in the evening that the birds will have time to eat before roosting time.

The Contest

Following are the leading pens for each variety for December: Buff Orpingtons, Missouri, 120 eggs; Black Langshans, Missouri, 112; R. I. Whites, Missouri, 110; White Wyandottes, Illinois, 109 R. C. White Leghorns, Missouri, 103; Silver Wyandottes, Missouri, 101; Buff Leghorns, Michigan, 90; Barred Rocks, Missouri, 89; R. C. Reds, Missouri, 87; Anconas, Missouri, 78; S. C. White Leghorns, Missouri, 75; White Rocks, Missouri, 74; S. C. Reds, Missouri, 71; Brown Leghorns, Kansas, 71; Buff Wyandottes, Vermont, 57.

The ten leading pens to date are as follows: R. I. Whites, Missouri 216 eggs; Buff Orpingtons, Missouri, 207; Silver Wyandottes, Missouri, 204; Buff Orpingtons, Missouri, 186; Buff Leghorns, Michigan, 167; R. C. White Leghorns, Missouri, 163; R. C White Leghorns, Missouri, 163; White Wyandottes, Missouri, 161; Barred Rocks, Missouri, 158; Black Langshans, Missouri, 158.

STORRS EGG LAYING CONTEST

Storrs, Conn., Dec. 27, 1918.—Report for the eighth week ending December 26:

Although the laying contest at Storrs has been running for eight weeks there are still three pens, containing a total of 30 birds, that have failed to produce any eggs. In addition to these, there were nine other pens which failed to lay any eggs during the eighth week. The total production for all pens amounted to 1603 eggs, which is a gain of 119 over the previous week and represents a production of 22.9 per cent. Only one individual was able to make a perfect score for the week. This bird was a Barred Plymouth Rock belonging to Jules F. Francais of Westhampton Beach, L. I.

The winning pen for the week was a group of White Wyandottes belonging to Laurel Hill Farm, Bridgeton, R. I. Their total yield amounted to 45 eggs. A pen of Barred Plymouth Rocks belonging to Jules F. Francais won second place with a yield of 41 eggs, and they were closely followed by Obed G. Knight's White Wyandottes from Bridgeton, R. I., with a yield of 40 eggs.

The following table presents a few of the outstanding facts regarding the White Leghorns entered in the seventh contest which closed about two months ago. Corresponding figures for the leading pen of White Leghorns in the same year are given below for comparison.

Breed summary—1917-1918 — White Leghorns:

	Average Per Pen.	Winning Pen.
Egg yield	1624	2043
Mash consumed (lbs.)	494	644
Grain consumed (lbs.)	402	423
Value of eggs	$73.50	$95.18
Cost of feed	$28.24	$33.16
Difference	$45.26	$62.02
Weight of eggs per doz (oz.)	24.1	23.9
Value of eggs per doz (cents)	54.3	55.9

The three best pens in each of the principal varieties are as follows:

Barred Plymouth Rocks

Samuel M. Monks, 212; Rock Rose Farm, 160; Jules F. Francais, 151.

White Wyandottes

Obed G. Knight, 280; Laurel Hill Farm, 256; Patrick F. Sullivan, 170.

Rhode Island Reds

Laurel Hill Farm, 212; Deer Brook Poultry Farm, 159; Jacob E. Jansen, 144.

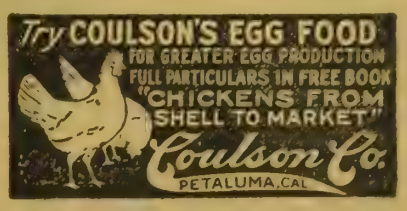
White Leghorns

D. Tancred, 257; L. E. Ingoldsby, 234; Hilltop Poultry Yards, 215.

Miscellaneous

S. Bradford Allyn (White Rocks), 105; H. A. Wilson (White Rocks), 107; H. P. Cloyes (Buff Wyandottes), 71.

LATE AND EARLY MOLTERS



By Jean A. Koethen

A reader who is evidently trying to work out her own poultry problems writes: "I have read several times the statement that the early molter is a late layer; the late molter the first to lay. It has not proven so in my experience. I have some fine hens that are not through molting and are not laying. After about six weeks' idleness my hens that are through with their molt are laying."

Such a statement as that quoted is misleading and must have been very carelessly made. Naturally, the hen that molts first will resume laying first. The rule pretty generally accepted by experiment stations and careful breeders is that the late molter is almost certain to be a better layer than the early molter. The latter quits laying in July or August and goes into the molt because she is not a persistent layer. The late molter lays on into October or November or even into December because she is a persistent layer and is not easily turned aside from her chief purpose in life, which is to lay eggs. The early molter may begin to lay about the time the late molter goes into the molt, but she did not lay as many eggs before she molted and will most likely not lay so many afterward.

The late molter, observation has proved, spends less time molting than her more frivolous sister. If she goes into the molt in November she may not infrequently be found laying again in January. This is because she is a real, honest to goodness layer, and cannot take time to prink. The early molter may begin laying in November, but she probably lays fewer eggs in a week than her more serious sister, and is sidetracked by changes in the weather or her diet. There are hens that molt and lay at the same time, but they are not so common as one could wish.

It is because the late molter has been so often found to be the best layer that the color test is recommended. By the first of November the hen that has been laying steadily all summer and fall will have pale shanks, pale vent and earlobes and beak, and her feathers will be faded and rough. The hen that laid off and went into the molt in July or August, on the other hand, has by this time completed her fall dressmaking, and is bright and glossy in plumage, and yellow in the shanks, while the natural creamy yellow color has returned to the vent and earlobes. This test, however, seems to be reliable only when applied to the yellow shanked birds of the Mediterranean and American breeds. In a flock of White Leghorns it is quite easy to separate the hens into three or four different groups, the best layers being those with the least color, and the poorest those whose shanks, vent and earlobes are a fairly bright yellow. Such a test can, of course, be made only in the fall or in

Chickens Sick?—Use Germozone
Roup, colds, bowel troubles, sore head, limber neck, etc. At dealers or postpaid 75 cts. with 5 book Poultry Library.
GEO. H. LEE CO., Dept. 418 OMAHA, NEB.

OVER two hundred thousand men work from sunrise to sunset every day in the year to feed valuable grain to rats, gophers and other vermin. How many men do you hire to feed grain to rats?

How much of your last year's grain did the rats and vermin spoil? Probably considerably more than even you know about. You lost. The rats "beat you to" some of your deserved profit—they do it each year. They'll do it this season—unless you handle your grain in bulk.

The Calco Metal Grain Bin, for handling your grain in bulk, lasts a great many seasons. It starves the rats and gophers. It enables you to sell your **entire** crop—extra profit from the grain that otherwise would be lost.

Write for the free booklet

The Calco Grain Bin protects your grain from rain, fire and thieves. It's the safe and economic way. Write for the booklet, "Calco Grain Bins." It's full of things to think about. Write for it at once—it's entirely free.

late summer, when the early molters are ready to lay again.

Professor Dougherty considers June, July and August the best time for culling by color. This is before molting has really begun, and the hens showing yellow shanks at this time are the hens that have not laid diligently enough to diminish the amount of color pigment in their bodies, while the faded hens are those that have laid steadily all winter and spring. In this case late or early molting is not a factor.

FINE RABBIT SHOWING

Written for California Cultivator
By W. D. White

RABBITS red, rabbits white, rabbits black and rabbits blue, in fact so many rabbits I hardly knew what to do." Standing in one end of the long room filled with rows of cages and viewing the fourth annual pet stock show of the Southern California Rabbit and Pet Stock Association held at Los Angeles this week, thus did the writer express himself. So many rabbits were shown, there being nearly 300 entries, that the chicken men almost got jealous and no doubt many of them vowed they would keep some rabbits in their back yard the coming year. Rabbits valued at from $25 to $50 were common there. Rabbits with pedigrees of six to eight generations were on every hand. Rabbits that had won ribbons and cups in many shows were there and gazed contentedly at you while you admired them. The fur rabbits of all colors were there, and just across the aisle were show cases filled with furs made from the skins of their relatives.

Rabbits that made the children laugh ("Ain't they cute?") and rabbits that made you hungry as you thought of them properly dressed and cooked and on your dinner table; rabbits so dainty they could nestle down in a lady's hands and rabbits so heavy she could hardly lift them; Uncle Sam's aviators could see rabbits there that some day might be killed, their skins tanned and made into garments for their protection as they skim the clouds. The working man could see does that at small cost and with a little care daily would produce for him in a year 90 pounds of the best of meat. In passing let us say that the rabbit exchanges in Los Angeles handle over 5000 rabbits daily for market purposes and many of the exhibitors said that they could not supply their local trade.

It was hard work to get the ladies (and men too) past the exhibition of the Coney Fur Club. Fifty pens of live stock and showcases with over $1500 worth of furs, ranging in price from $5.00 for a child's set of furs to coatees for the ladies of $150.

Many fine specimens of rabbits were there, such as a pair of White Polish, the only pair known in this section; some beautiful White Flemish only eight months old and weighing 12½ pounds; a Checkered Giant doe of 16 pounds weight, the largest Checker ever shown in Los Angeles.

It took two cages for "Country Gentleman," a stately steel gray Flemish buck, 17 pounds official weight. He is a grandson of Major Domo and is quite proud of his ancestry.

As usual the New Zealands and Gray Flemish predominated. These were the two largest classes in the show.

Judge Gibson was detained two days by snowdrifts in the Rockies, so could not give the awards at the first of the show.

THE POULTRY BREEDER SHOW

Continued from Page 67

be the advantages of caponizing, it certainly does not improve the appearance of the bird.

The room back of the large show room was occupied by Andalusian, R. C. Red and White Wyandotte breeding yards, and by an interesting assortment of turkeys, ducks and geese. There were Bronze and White Holland turkeys, Rouen and Pencilled Runner Ducks and a choice bunch of Toulouse geese. Four Pearl guineas occupied coops in Bantam Alley, which was well filled.

The bantam exhibit is always interesting, and the progress which is being made in bantamizing, if one may coin the word, the large breeds, merits careful study. Buff Cochin and Silver Seabright are among the oldest of the bantams; Black Minorca, Partridge Orpington, Golden Pencilled and Silver Spangled Hamburg among the newest. Black Breasted Red Game, Rose Comb Black, Rose Comb White, White Polish are standard varieties that have graced many a show room. Patriots and ravens are the creation of a local fancier.

For the most part the exhibitors were Los Angeles County fanciers, but there were turkeys from National City, Minorcas from Santa Rosa, Dark Cornish from Reedley, Fresno County, Barred Rocks from Point Loma, Rhode Island Reds from San Bernardino and some other outside exhibits.

Considerable interest centered in the government exhibit of coops, brooders and pictures of standard bred poultry. Such suggestive mottoes as "Hatch Early," "Raise More Poultry," "Preserve Eggs," "Keep two hens for Each Member of the Family," etc. served to point a moral and adorn a tale, and a large placard announced that much helpful literature could be had at the public library. Such practical suggestions can hardly fail to be of real educational value.

The rabbit department on the second floor was the center of much enthusiastic interest. Here were rabbits of all sizes and breeds and colors, Himalayas, Flemish, New Zealand, Blue, Black, Red, White, Gray, Spotted, young and old, little and big, fur bearing and meat breeds.

Officers of the Poultry Breeders' Association are: W. J. Stewart, president; Harold Walthew, first vice president; H. L. Gill, second vice president; Walter M. Ross, secretary-treasurer; H. D. Armstrong, auditor.

Judges of the mid-winter show were: W. S. Russell, colored Plymouth Rocks, Andalusians, Minorcas, Cornish, Sussex, Asiatics.

C. H. Burnett, Jr., Rhode Island Reds, Wyandottes, Orpingtons, Clean Legged Bantams.

Lieut. E. B. Smiley, White Rocks, Anconas, Leghorns, Turkeys, Feather Legged Bantams.

Charles S. Graham: Rabbits and Cavies.

Judge Russell is from Concord, California; Judge Burnett from Seattle; Lieut. Smiley from Marsh Field; Judge Gibson from Detroit, Michigan.

THE POULTRYMAN'S CALENDAR FOR JANUARY, MONTH OF BEGINNINGS

Mate the breeding pens that are not already mated, and begin after two weeks to save hatching eggs.

If you have to purchase eggs or chicks, order them immediately. The Cultivator is always glad to give information as to reliable breeders.

Start the incubator as soon as you have eggs. Never mind if it is not full, better a few early chicks than none at all.

Mate the breeding ducks and start incubation this month, green ducks must be early if they are to be profitable.

Clean up the brooders and brood coops. Crude carbolic acid is a good disinfectant; so are the cresol preparations. After the coops are cleaned and disinfected, let them stand in the sun till the sunshine has reached every corner.

Every vacant run should be spaded and planted this month. Plant barley, wheat, oats, if the chicks are to run on it; kale, chard, beets, cabbage, if it is to be fed by hand.

Try to get the first lot of chicks out by the first of February. The early pullet is the dependable one.

If there is a vacant patch of ground available, plant it to alfalfa. There's nothing like alfalfa for chicks and poults.

Plan for a few turkeys later on. They will come handy about Thanksgiving. Look up reliable breeders and place your orders.

Legal Queries

Louis B. Stanton, attorney, 243 Wilcox Building, Los Angeles, will answer legal queries in this department.

Immediate mail replies cannot be given except where fee to Mr. Stanton is paid When replies are wished in Cultivator address query to 115½ N. Broadway, Los Angeles.

Bad Faith

A and B agree to trade properties; pending the clearing of a cloud on the property of A, deeds are placed in escrow. A clears the title, deeds his property to third parties, who immediately record the deed, unknown to B, while papers are in escrow, thereby depriving B of the property. In executing two deeds to different parties for the same land would A commit a crime or would the remedy be a civil action for damages from B? — Subscriber, Tulare.

The property of B not having passed to A in the above case no crime was committed by A, although it presents an apparent case of bad faith. B would be entitled to recover damages which would be the expenses properly incurred in examining the title and preparing the necessary papers, with interest thereon, and in addition thereto the difference wherein the property of A exceeded the value of the property of B and the expenses B properly incurred in preparing to enter upon the land.

Title

At the time of marriage Mrs. A. owned a farm; two years thereafter Mr. A. bought an adjoining farm, borrowing the money from his mother. To secure the payment of this money Mr. and Mrs. A. gave the mother a mortgage on both pieces of land and paid interest thereon. The mother loaned the money from the estate of the deceased father of A. After two years this estate was distributed and Mr. A.'s share was the amount of the mortgage, the cancellation of which he received as his full share. Is this farm purchased community property or the separate property of A? Could A dispose of or mortgage it without the signature of Mrs. A? Could she dispose of her farm, owned prior to marriage, without his consent?—Subscriber.

The above question presents quite a knotty problem and the opinion given upon the facts as stated might be very different upon a more thorough investigation of the various acts and declarations of the parties. One authority holds that where property is borrowed upon the credit of the separate property of the wife and property purchased with the borrowed money, even though the husband joins in the mortgage, the property purchased is the separate property of the wife; in conjunction with another authority the cancellation of the mortgage would relieve the property of the lien which the husband might have retained by way of presumption of gift of the wife. If the title to the new property was taken in the name of husband and wife, under the circumstances it might be presumed that each have an undivided one-half interest as separate property. From the statement it does not seem to be community property nor does it seem to be the separate property of A entirely. Therefore, it would be necessary for the wife to join in any mortgage or transfer of the new property. The farm owned prior to marriage by the wife is her separate property and it is not legally necessary for the wife to obtain the consent of her husband to any conveyance thereof, although careful title companies usually require it.

Completing Contract

A owns real estate and sells to B on contract payments, agreeing to give B deed when final payment is made. A dies before final payment and deed have been made. What course should be followed by B or by the heirs of A?—Subscriber.

It would be necessary to have an administration upon the estate of A. After the administrator is appointed a verified petition is presented to the court, either by the administrator or by B setting forth the facts as above stated, notice of the date of hearing said petition is given both by personal service on the administrator and by publication. If the court finds that B is entitled to his deed and makes his payments or has made them, it is ordered that the administrator carry out the contract and deliver the deed in accordance with its terms. If the heirs of A refuse to petition for the administrator, it would be competent for B to do so and then the costs and fees would be offset against the balance due on the contract or other estate of A.

SAN FERNANDO VALLEY LIVE STOCK MEN

Assistant Farm Adviser Scribner of Los Angeles County will have charge of the farm bureau meeting of live stock men at the Elliot-Brant Rancho, Owensmouth, January 23-30. Advisor Scribner announces: "Various topics of current interest to live stock men will be brought up for discussion, including the value of the pure bred sire, dairy conformation, good points in the hog, as well as others. All live stock men are invited."

Farmers and Fruit Growers, Attention!

Order your Trees NOW from the biggest and best nursery on the Pacific Coast. Reliability counts.

(Fifty years in business—1000 acres in nursery.)

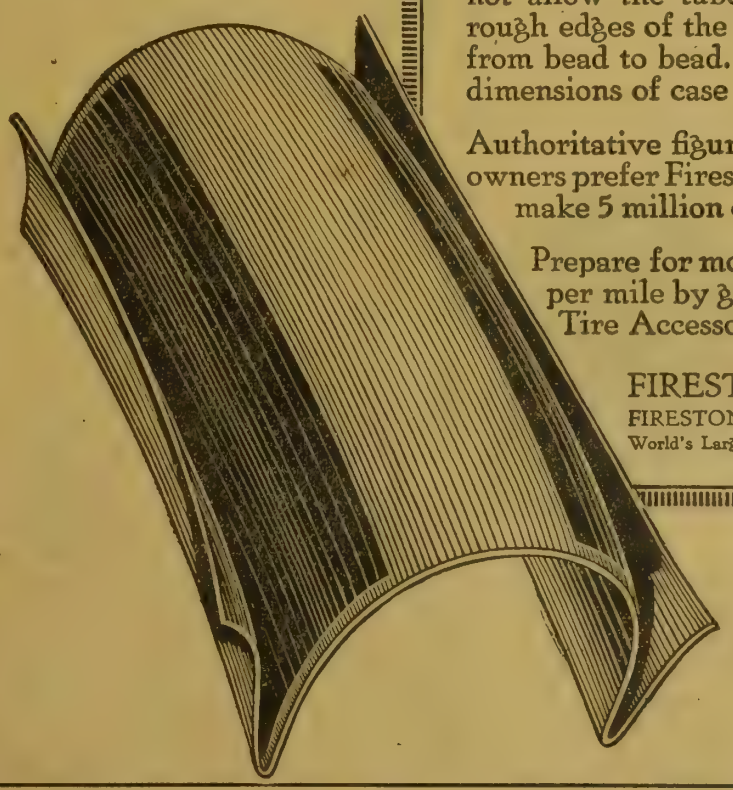
Firestone Tire Accessories

Get This Blow-Out Patch



THE Firestone blow-out patch performs both duties, holds the blow-out securely and protects the inner tube while in casing.

Built of six plies of rubberized fabric, it is flexible and yielding. It is protected at both ends by a molded-in real rubber tip, originated by Firestone, which does not allow the tube to come in contact with the raw, rough edges of the fabric. It is wide enough to extend from bead to bead. It is curved to fit snugly the inside dimensions of case and cannot buckle, see illustration.

Authoritative figures show that one in every four car owners prefer Firestone blow-out patches. Firestone will make 5 million of the 20 million to be sold this year.

Prepare for most miles per dollar and least trouble per mile by getting this patch and other Firestone Tire Accessories from your dealer.

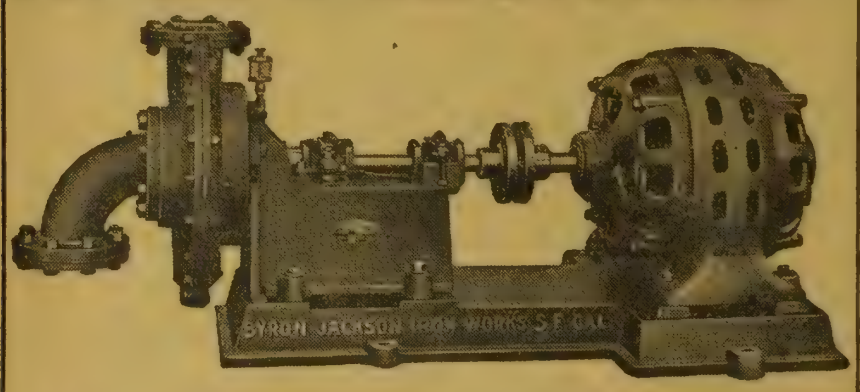
Take good care of your
Westclox alarm



GOOD alarm clocks are not as easy to get as they used to be. The war has made them scarce. Yet they are more in demand today, as household timekeepers, than ever before.

Careful treatment will make your Westclox alarm last longer.

We have prepared a booklet that tells you more about your clock. Since July, 1918 this booklet has been packed with every Westclox alarm. If you bought your clock before that time you may have one of these booklets by mail. A postal card from you will bring it.

THE BEST OF BIRDS

Let the others raise their ditties to the sparrows in the cities,
Let them prate about the peacock if they will;
Let them talk about the robin or the mournin' dove a-sobbin',
Or the blackbird as it whistles on the hill;
Let them sing about the jay bird, givin' praises unto that gay bird;
Let them boast about the linnet or the wren;
But I'm proud to say my charmer is the comfort of the farmer,
And I'll raise my little ditty to the hen.

If you're only out for beauty, it is probably your duty
To descant upon the bulbul in the tree;
Or, if wisdom's what you're after then the owl upon the rafter
Quite the true and proper caper's said to be;
But it's usefulness I'm praisin', and my ditty I am raisin'
To the best and truest feathered friend of men;
And so here's to that great blessin', may her shadow never lessen,
Just the humble and hard-workin' barnyard hen.

BEING A CHICKEN WOMAN

BEING desirous of making my own spending money, I decided to engage in the poultry business. A friend told me that her mother had fine Buff Rocks and that she would send me a setting of eggs.

They arrived in due time and to my great joy hatched two roosters and five pullets. Ote and Dick, the two roosters, developed into fine specimens of game, Rhode Island Reds and some other mixture. They were beauties, but fight they would, until one May morning they concealed themselves in the hen house and fought to a finish. Ote came out victorious, leaving Dick on the battlefield for the pall bearers.

Somehow, their offspring must have inherited fighting propensities, for before they were feathered out they would congregate into groups of four or five and fight until their little heads were picked to the brain.

Then it was that my woes began. I tied these chicks together, laying them about the yard, or separated them in coops, but all to no avail. As soon as released they were at it again. Well, what could I do but sell the whole lot, feeling that if these red fighters were buff Rocks I'd try brown Leghorns!

I invested my money in Leghorn eggs and to my dismay hatched one pullet and one rooster out of figteen eggs. They looked like quails and flew like sparrows, so these pure breds were served for quail on toast to an invalid.

My heart was still set on Buff Rocks—real ones! I read all the advertisements in the farm papers and poultry journals hunting for what I wanted.

In the meantime I was told by a poultry judge to buy only the best. He recommended a certain breeder, so when my husband gave me $25 for Christmas, I decided to send to the breeder and get a good one. He wrote me that he could send me a fine "bird" (then it was I learned that a chicken is a "bird" when spoken of by a fancier), scoring 93½, who "would take first prize in any of the big shows." He said that it would have red eyes, yellow legs, full breast, etc., all for the small sum of $25.

After gazing tenderly at the prized Christmas gift, my mind turned to the first prize money and the fame of having the finest bird in the show.

The money was hastily sent for the much coveted prize. In a few days the expressman drove up with the anxiously expected cockerel — and $1.60 express added. (I had also learned that if I was going into the show business I must say "cockerel" instead of "rooster".)

He was a hollow breasted, high stepper, with white speck on wings. The "standard of perfection" I found out later, said "full breast and wings free from white." You see I had never been to a poultry show nor had I ever seen a real buff Rock.

He was shipped to the show and in my imagination I could see the blue ribbon floating in the breeze in front of my coop. But, lo and behold! he did not get even second place—scoring only 87½ points. I argued with the judge, telling him I had paid $25 for that show bird from one of the biggest breeders in the West, but all to no avail. He pointed out the defects, which I afterward learned were true.

Woes! Woes! But surely the breeder would take him back and return my Christmas present, as the cockerel was not as recommended. Not so, I had kept him over the three days' time limit. Another woe, but something learned.

Poor cockerel! His disappointment was so keen that he failed to distinguish between his throat and his windpipe and several grains of kaffir corn caused him to be laid beside fighting Dick.

Now, in the meantime I had patronized a home concern and bought a setting of eggs which hatched some fine pullets, but what good were pullets alone as breeders? I must have a male and a good one, as he is half the flock.

I read and reread all the Buff Rock advertisements I could find and decided to try an Eastern breeder for a change. After much correspondence I procured another "bird" for the mere pittance of $25. He was a fine fellow, all but his comb which was too thick. I entered him in a big show, getting second prize and lots of experience. After keeping him a year I sold him for $5 on credit.

I purchased a setting of eggs, 15 for $10, getting two pullets and one fine cockerel. From this time on I began to line breed. Blue ribbons were no longer a dream but a fond reality and I had, through my woes, learned that it pays to buy good stock.

Did my troubles end there? No! They only began! The pens must be properly mated, the chicks hatched and reared. I purchased an incubator and set it in February. Oh! the sleepless nights of sitting up with that inanimate hen!

But in due time the eggs began to slowly hatch. Some said wring cloths out of hot water and cover eggs, some to sprinkle, some one thing and some another. I tried them all and three days over time a bunch of little golden weaklings come off, which I considered it my duty to keep warm, and I did till their little bodies became thinner and thinner and their "peep, peep" fainter and fainter.

But even incubator troubles can be overcome by common sense and experience. Weaklings can be changed into strong vigorous chicks, by a good home made brooder and plenty of clabber milk to prevent bowel trouble. Out of 115 hatched this year we lost but one.

Oh, I must keep to woes! What must I do for the many ills which poultry is heir to? Open a drug store, of course!

So I did, and labeled all the bottles and boxes.

Then I began to watch for symptoms. If a chicken had a cold he must have a dose of oil and his throat swabbed with the carbolized vaseline. If sore combs and wattles caused from mosquito bites, the same remedy applied to affected parts. If sluggish and poor appetite a little epsom salts mixed with moistened bran, to help the liver along.

These woes are past. Now, the winter layers, the conquered incubators, the sensible brooder, the good old clabber milk (nature's remedy for bowel trouble), the early friers, the fine cockerels and pullets, have all put a new song in my mouth—that they who persevere shall be abundantly rewarded, in sleep, time, and money, with a poultry ranch of pure breeds, equal to any of the East or West. For pluck, work and common sense will win!

CONCERNING BLEACH AND DYE POTS

Written for California Cultivator
By Margaretta A. Walker

We have often found that the beautiful daintily colored voiles and summer goods do not stand either the California sun nor the washing. If the colors withstand the sun until the dress is ready for the wash I find it pays to put it through a solution of sugar of lead to set the color before washing. Sometimes if I am particularly desirous of retaining the color I immerse the goods in this solution before making up. This serves both to set the color and shrink the goods.

In case the color does not hold but fades from sun or washing I send the dress to the laundry with the request

that they put it through their bleaching bath. The result gives a new pure white dress already made. One striped seed voile in black and tan was unfortunate in having ink spilled over the front breadth. This was sent to the laundry to be bleached. The dress was much prettier than before the accident. Old dresses can be made new in this way with very little expense.

After the peach season when the small boy's suits were hopelessly faded and stained I mended all torn and worn places, then removed the stains, and incidentally much color, with javelle water. After this was done I colored the lighter suits pink for afternoon wear while I dyed the heavy ones dark blue. This nearly doubled the wearing quality of his clothes, as they now look respectable instead of being all stained and faded with bright patches showing. Now the mended places are not noticeable.

When dyeing the more delicate colors I make a practice of saving a bottle of strong solution of the dye which may be used on the article during subsequent washings.

Sugar sacks dyed a golden brown make excellent summer shirts for the boy to wear with khaki trousers. Other sugar sacks I dyed in a weak solution of dark brown dye and made a fine shade of light tan for the linings of comforts. Being soft and firm they answered this purpose splendidly.

I took three heavier sacks, I believe they were either seed or meat meal sacks, and colored them golden brown. From them I made a pair of full bloomers with a bib waist which can easily be slipped on over my afternoon dress and the skirt kept safe from dirt if I find it necessary to run out to feed the chickens or milk the cow. This is really an indispensable garment on the ranch.

Another economy of the dye pot, and a really "nifty" one too, is to hem a bias piece of white cotton poplin or pongee and color it and a pair of small socks, which can be obtained for ten cents. The small lad can then wear matched ties and stockings and really, this, by varying the colors makes even an old white suit take on a new appearance.

SOME ECONOMICAL RECIPES

Written for California Cultivator
By Mrs. N. Peacock

One Egg Cake

Two and a half cups flour, one-half cup cornstarch, one and a half cups sugar, two heaping teaspoons baking powder, one-half teaspoon salt. Sift dry ingredients together and moisten with two cups milk into which the yolk of an egg has been beaten. Melt one-half cup lard and stir into mixture. After beating thoroughly fold in white of egg and bake in moderate oven until cake leaves side of pan.

Bacon Stew

Fry one-fourth pound fat bacon until grease is out and add five large, finely sliced onions, let fry until onions are yellow. Pour in one and a half quarts boiling water or stock. Add seven large potatoes cut into cubes. Season with salt, pepper and chili powder to taste and cook until potatoes are done.

Onion Pie

Peel, slice fine and fry in butter or lard eight or nine large onions until just before they turn yellow. Salt to taste. Line pie plate with rich biscuit dough rolled thin and fill with the onions. Pour one-half cup thick cream over pie and bake until crust is done. If you like onions try this recipe.

Meatless Mince Pie Filling

Cook together two quarts apple sauce or four pounds peeled and sliced tart apples, one pound raisins, one-half pound currants or seedless raisins, one teaspoon each of cinnamon, cloves, allspice and nutmeg. Add one-half cup strong vinegar, one cup sugar and one heaping teaspoon salt. Boil 30 minutes, being careful it doesn't burn.

Cookies

Cream one cup butter or lard and one cup sugar. Add one well beaten egg and one cup milk. Sift together two teaspoons baking powder, one-half teaspoon salt and about one and a half cups flour or enough to make a soft dough that can be handled easily. Roll thin, cut and bake in quick oven.

Plain Plum Pudding

One-half cup lard, one-half cup sugar, one cup seeded raisins, one-half cup currants or seedless raisins, two cups flour, two teaspoons baking powder, one teaspoon mixed spices, one-half teaspoon salt, three-fourths cup milk, one egg.

Clean currants and add them to raisins and suet. Sift flour with the spices, baking powder and salt, add to fruit with sugar, moisten with the egg and milk and turn into greased pudding mould. Steam three hours and serve with hard or lemon sauce.

Creamed Fowl or Rabbit

Cook a young fowl or rabbit until very tender and season to taste. Then place meat in baking dish and pour over enough sour cream to cover. Place thin layer of moistened bread crumbs on top and brown in oven.

BRINE CURE FOR HAMS, SHOULDERS AND BACON

For a very good brine cure take for each 100 pounds of meat, five gallons boiled water, ten pounds of salt, two ounces of saltpeter, three pounds of sugar. Slowly dissolve all ingredients in the bottom of the container, then place the meat in it very snugly, cover with board or earthen cover, weighting it with something that will not rust (use stones, don't use iron), then pour the brine in. This is especially recommended for hot climates as the meat is easily protected from insects and vermin.

Leave the meat in the brine four days to each pound, that is 40 days for a ten-pound ham. Every week take all the meat out of the barrel then the brine. Place the meat back with that which was on the top on the bottom, then put the brine back. When the meat has been long enough in the cure take the meat out of the brine and soak it in water for an hour, then wash it in warm water and hang it in the smoke house over not too hot a fire, 120 degrees, until the required color is obtained. Forty-eight to sixty hours is usually adequate.

Watch the pickle and if it becomes ropy take out all the meat and wash it in warm water. Boil the pickle or make new, wash the container and put the meat and brine back.

The home curing of pork is a good practice and should be extensively adopted. Try it. — W. E. Schneider, Swine Specialist, University of Arizona.

For I do know
God's patient love perceives
Not what we did
But what we tried to do.

Home is home, though it be ever so homely.—Clarke.

I've made it a practice to put all my worries down in the bottom of my heart, then set on the lid an' smile.—Mrs. Wiggs.

Western Electric POWER and LIGHT

Belted

Careful Buyers Prefer to Have a Choice of Plants

Direct Connected

Get the plant that fits your needs. Don't fit your needs to any particular plant.

A "bull-tongue" plow won't do good work in meadow land; neither can a strong arsenate spray be used on budding trees. The right tool for the work —that's the right idea! And it is this idea that's behind our selling plan for electric plants.

If a man has an engine, we are content to sell him the necessary electrical equipment; no reason why he should buy another engine. If, however, he wants a complete plant, we offer him two kinds:—(1) the belted type where the engine is belted to the generator and is readily available to drive other machinery. (2) the direct connected type, with engine and generator built in one unit.

We are not interested in selling any one particular type of plant. You can choose the one that will best serve your needs.

And remember that the Western Electric Company with its forty years experience, offers you not alone its line of power and light plants, but its motors, water system, milking machine as well as a complete line of electrical labor saving appliances for the home—all bearing the familiar trade mark, Western Electric, your guarantee of satisfaction.

There is a Western Electric man near you. Mail the coupon for Booklet No. CCL-12, and we will tell him to get in touch with you.

Killefer Efficiency

The Killefer

Killefer Quality

Automatic Double-Disc Harrow

Working Position

Without doubt this is the most important development made in the manufacture of farm tools to date. This is the only Automatic Disc Harrow on the market. It was designed and built in our own shops completely. We are therefore the originators and have it fully covered by patents.

In the development of this, our latest triumph in Disc Harrows, we have not only maintained the greatest strength and durability as originally designed but have added additional valuable features, namely your

Automatic Shifting Device,

controlled by the operator from the seat of the Tractor and a greater flexibility so desirable in a tractor disc harrow, but not found in other makes.

This Harrow is built in all sizes from 5 to 12 feet inclusive.

Orders should be placed now to insure delivery.

A Season's Work Without Expense For Repair Parts

BEAN TrackPULL Tractor

Do your work without expense for repair parts for your first season of 90 days. Our Guarantee Bond, issued to the purchaser of each Bean Tractor, is a broad, liberal agreement reflecting our confidence in the BEAN to do your work without unnecessary expense.

Thirty-four years of manufacturing integrity is behind this guarantee.

Let us tell you about this new "After-The-War" proposition and about the special orchard and vineyard Bean TrackPULL Tractor.

Reduction in Price

In addition to the Guarantee Bond we are now, on account of "After-The-War" conditions, announcing a reduction in price on the Bean Tractor. The new price is guaranteed to June 30, 1919. If the price should be reduced between now and the above date (and this is improbable) the difference in price will be refunded. This means you can buy your Bean Tractor now, knowing that the price is stationary.

Special Tractor

This great little 6 H. P. machine, designed by builders of special orchard and vineyard machinery for 34 years, combines a wealth of experience in the one most effectively designed to meet orchard and vineyard needs.

Our After-The-War Proposition

This entire "After-the-War" tractor proposition is backed by a tractor of high efficiency with splendid service plan in operation and is something you can't afford to overlook if you are going to buy a tractor this year. Send coupon today.

Bean Spray Pump Co., 227 W. Julian St., San Jose, California.

LIVESTOCK

The market for all grades of steers continues active at firm prices. Cows are in good demand and those showing good flesh, demand strong prices. Local packers do not get as many cows as their trade demands. Hogs are a little easier and the supply is more plentiful. Adequate supplies of lambs with no noticeable increase in the demand for them has resulted in a weakened tendency to this market especially on the poorer grades.

Wethers continue very scarce and the market for them is strong and active. Ewes are a slow sale and local killers are reluctant to increase their present supply on a market so weak as it is at present.

Report of live stock conditions on the Los Angeles market as compiled by the United States Department of Agriculture, Bureau of Markets, through the local office. The following are live stock prices on the Los Angeles market f. o. b. packers' yards. Prices at country points are $1.00 to $1.50 per cwt. less than these quoted:

Good Steers .....13.00@14.00
Common .....11.50@12.00
Good Cows .....10.50@11.00
Medium Cows .....8.00@9.00
Common and canners .....6.00@7.00

Prices quoted below are for carload shipments f. o. b. slaughterers' pens. Driven-in, or truck hogs sell for ½ cent less.

Hogs—
No. 1 hogs, 150-225 lbs. .....16.50@17.50

No. 1 Barley straw, bale	50@80

SEEDS

Flax	8@8½
Millet	5@5½
Rape	2½@5

Citrus Fruit Market

Los Angeles, Cal., Jan. 15, 1919.

Frost damage is still uncertain and the market is affected by fruit conditions. The agreement on the part of the shippers to hold off shipments has had good effect however. The state standardization law gives power to the commissioner to prevent any frosted fruit going forward.

The lemon market is in good condition with foreigns arriving freely.

Shipments

Shipments of citrus fruits to date since November 1, 1918: Southern California; oranges 2723 cars, lemons 1275, total 3998. To same date last season; oranges 2467, lemons 602, total 3069. Central California this season; oranges 2863, lemons 259, total 3123. Last season to same date; oranges 1812, lemons 87, total 1899. Northern California; oranges 230, last year same date, 199.

AT THE AUCTIONS

January 8

New York: 10 oranges, 3 lem. Lower. Nav. 4.30-5.75, lem. 3.80-4.55.

Cleveland: 4 cars. Nav. 2.60-5.10.

St. Louis: 2 oranges, 2 lem. Nav. 2.95-3.90, lem. 2.20-3.20.

Philadelphia: 2 oranges, 2 lem. Nav. 4.15-4.65, lem. 3.45-4.05.

Boston: 7 oranges, 2 lem. Nav. 3.45-5.15, lem. 3.35-3.80.

January 9

New York: 12 oranges, 4 lem. Nav. 3.80-5.55, lem. 3.15-4.25.

Pittsburg: 4 oranges, 1 lem. Nav. 3.30-5.60, lem. 3.55-4.60.

Boston: 5 oranges, 2 lem. Nav. 4.20-5.50, lem. 2.05-4.15.

January 10

New York: No sales on account of strike.

Philadelphia: 2 oranges, 2 lem. Nav. 3.55-5.15, lem. 2.40-4.00.

Boston: 3 oranges, 2 lem. Nav. 4.35-5.40, lem. 2.55-4.15.

St. Louis: 2 oranges, 2 lem. Nav. 3.95-4.70, lem. 3.20-3.50.

January 14

New York: 17 oranges, 5 lem. Lower on oranges. Higher on lemons. Nav. 3.05-5.10. Arizona Nav. 3.70-3.95; Navelencias, 4.35-5.00, lem. 2.65-4.25.

MARKET NOTES

Arizona sheep men find that prospects are exceptionally bright as desert pasture is proving fine and prices promise to be phenomenal.

Thousands of range cattle will be taken from Southern Arizona early in the spring to graze on cut over lands of Michigan and Wisconsin.

Bureau of markets report fancy packed lemons around $4.50-5.00 a box in Los Angeles.

Watsonville Bellefleur from storage are now commanding around $1.90-2.25, Yellow Newtons, $1.90-2.00.

Tuesday's arrivals of potatoes in Los Angeles market totaled 15 cars from California, 3 from Oregon, 4 from Idaho with 42 cars on track unbroken. In addition 8 cars have been diverted to other markets. The demand is good and they are moving very rapidly. Sacked central prices ranging as high as $2.85 and even up to $3.00 for homegrown White Rose. Fair quality Idaho Russets selling around $2.40 and $2.50.

Imperial Valley is planting cantaloupes. Arizona is planning for the usual planting in the Glendale district. Planting there will not begin until early March.

PARTIAL LIST CALIFORNIA FRUIT AND VEGETABLE SHIPMENTS

From post card reports to the Los Angeles branch of the bureau of markets, report is made of the following shipment of cars of products from California for the week ending January 13: Apples, 84; cabbage, 35; cauliflower, 52; celery, 169; dried apples, 1; dried apricots, 2; dried beans, 37; dried peaches, 18; dried pears, 3; dried peas, 6; dried prunes, 29; lettuce, 32; mixed vegetables, 57; mixed fruit and vegetables, 40; mixed dried fruit, 38; olives, 6; onions, 4; peppers, 1; potatoes, 183; raisins, 255; spinach, 9; sweet potatoes, 10.

GOVERNMENT CONTRACTS AND THE CANNER

The Cultivator recently commented upon the rescinding of contracts by the war department in effect that there was possible injustice to producers and canners in the matter of holding these products for government acceptance, and then being compelled to dispose of them at prices lower than those for which they could have been sold at time contracts were made with the government. The department has ruled that the army will pay the difference between the price to which the individual packer may be entitled as ascertained according to the rules laid down in the United States Food Administration Bulletin No. 13, and a sum named for each zone.

The packer will receive strapping allowance and the expense of preparing the product for army use and carrying charges.

This basis of settlement is the only one which can be authorized by the director of purchase and storage, and in the event the packer is not willing to settle on this basis he will have to take his claim before the contract and settlement board.

CALIFORNIA SHEEP AND WOOLGROWERS ASSOCIATION

The eleventh annual meeting of the California Sheep and Woolgrowers Association will be held at University farm, Davis, Wednesday, January 22, 1919. Meeting called to order at 2 p. m. Among the most important questions for consideration are, "Plans for Reorganization, similar to those of the Cattlemen," "Methods of Selling our Wool in the Future," and "Legislative Matters of Importance."

Every sheepman should be present and make this a real meeting. Come prepared to answer the question, "Why is lamb cheaper on foot today on the Chicago market than either beef or pork, when it is so much more healthful?" Come prepared to remain all night, as we will not finish in one day. Roast lamb dinner will be served at 6 p. m. in the University dining hall. —Fred A. Ellenwood, President.

NATION REQUIRES MORE WINTER EGGS

According to the United States food administration:

An urgent necessity exists for a large output of eggs this winter.

Storage stocks are 21 per cent less than a year ago and are rapidly being consumed.

The United States must share its egg output and its storage eggs with Europe.

Importation of Chinese dried eggs stopped in February, 1918, and bakers are now using shell eggs, thus adding to demand.

Even with maximum production, conditions point to profitable returns for every fresh egg marketed.

The Most Efficient Tractor in America

No Side Draft

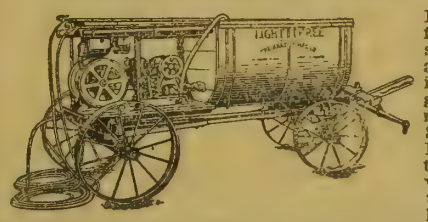
The Bates Steel Mule is built low, with a low center of gravity. And still it has nearly 14 inches' ground clearance.

The draft comes squarely in the center—cannot come from the side. So on hillsides there's no tendency to work down like in ordinary tractors.

Unit construction, Timken bearings, valve-in-head kerosene motor and long-life crawlers are a few of the other valuable features.

The STEEL MULE plants are working night and day filling orders. We have only been able to reserve a small number for early delivery. Better talk the matter over with us NOW.

THE ONLY CRAWLER TRACTOR ADAPTED TO BEET CULTIVATION WITHOUT MAKING CHANGES.



Excellent Proposition offered Live Agents.

18 Years Back of Hardie Sprayers

High Pressure, Light Weight, Large Capacity, Powerful Engine, Perfect Agitation, Simple Construction.

HARDIE POWER SPRAYERS are the final word in sprayers. They represent not only years of experience, but also an accurate knowledge of spraying needs and the conditions that govern spraying. Where spraying is most difficult you will find HARDIE Sprayers in the majority.

HARDIE SPRAYERS are noted for their simplicity. No complicated devices to cause trouble when every minute counts. You can put any of the help to work with a HARDIE and get maximum results. Makes the work of spraying easier than ever before.

When you see a HARDIE SPRAYER you will readily understand its superiority. See how compact it is—the few working parts and how everyone of them is quickly accessible. There are 21 HARDIE features that make it the leading power sprayer. The HARDIE CATALOG tells all about them. A COPY is yours for the asking. Send today. You can see a HARDIE at your dealer's.

Hardie Orchard Gun $12.00

The latest HARDIE device made to improve spraying conditions, shoots a cloud of penetrating spray, covers the trees with a fog. Easy to handle. Takes a tiresome load off the arms and does the work in much less time. Fits any high pressure sprayer and increases its efficiency.

Order a Hardie ORCHARD GUN from your dealer or direct from us. Money back if not satisfactory.

160 HENS—1500 EGGS

AS AMERICA'S foremost poultry expert I predict that eggs are going to retail for a dollar a dozen this winter. Right now the retail price is from 50c to 75c per dozen in some of the large cities. At a dollar a dozen poultry raisers are going to make tremendous egg profits. You, too, can make sure of a big egg yield by feeding your hens a few cents worth of "More Eggs" tonic.

This product has been tried, tested and proven. It is acknowledged the best and most successful egg producer on the market today. Every day that you don't use it means that you are losing money. Don't delay. Start with a few cents worth of "More Eggs" tonic now.

Got 117 Eggs Instead of 3

That's the experience of one poultry raiser who wrote me. A. P. Woodard of St. Cloud, Fla., writes: "I get from 40 to 50 eggs a day now. Before using 'More Eggs' I was getting only 8 or 9 eggs a day." Here are the experiences of a few others of the hundreds who write me:

"160 Hens—125 Dozen Eggs"

E. J. Reefer: Waverly, Mo.
I have fed two boxes of More Eggs Tonic to my hens and I think my hens have broken the record for eggs. I have 160 White Leghorns and from March 26 to April 15 I sold 125 dozen eggs. MRS. H. M. PATTON.

"15 Hens—310 Eggs"

E. J. Reefer: Turner Falls, Mass.
I used your More Egg Tonic and from December 1 to February 1, from 15 hens, I got 310 eggs. Your remedies are just what you claim them to be. MRS. C. R. STOUGHTON.

"More Than Doubled In Eggs"

E. J. Reefer: Mendon, Ill.
I am very much pleased with your "More Eggs" Tonic. My hens have more than doubled up in their eggs. L. D. NICHOLS.

126 Eggs In 5 Days

E. J. Reefer: Salina, Okla.
I wouldn't try to raise chickens without "More Eggs," which means more money. I use it right along. I have 33 hens and in 5 days have gotten 10½ dozen eggs or 126. MRS. J. O. OAKES.

Well Pleased With "More Eggs"

E. J. Reefer: Rochelle, Va.
I received my "More Eggs" Tonic about the 8th of January and am so well pleased with it I am mailing you $1.00 for another box. I have about 150 hens and get anywhere from 80 to 100 eggs daily, and one day over 100. MISS VERA BOWMAN.

"Selling Eggs Now"

E. J. Reefer: Hebo, Oregon
I was not getting an egg when I began the use of the "More Eggs" Tonic. Now I am selling eggs. MRS. J. F. BRINK.

"Gets Winter Eggs"

E. J. Reefer: Wilburton, Kan.
It is the first time I got so many eggs in winter. When I began using "More Eggs" I was only getting from 1 to 3 eggs per day and now I am getting 11 to 13 eggs per day. MRS. JULIA GOODEN.

18 Hens—12 Eggs a Day

E. J. Reefer: Luray, Va.
Six weeks ago I began giving "More Eggs" Tonic and I was not getting an egg from 18 hens, and now I am getting 10 to 12 every day. You can quote me as saying that it is the best chicken tonic in the world. R. L. REYNOLDS

"Layed All Winter"

Dear Mr. Reefer: Lackawana, N. Y.
I gave the tablets to my hens and in three weeks they began laying and layed all winter. I never saw anything like them in the world. Yours truly, MRS. ALBERT SMITH, Penna R. R. Ore Docks

"37 Eggs a Day"

E. J. Reefer: Elwood, Indiana
That More Eggs Tonic is simply grand. When I started using it they did not lay at all, now I get 37 eggs a day. Yours truly, EDGAR E. J. LINNIGER

"Increase from 2 to 45 Eggs a Day"

Reefer's Hatchery: Derby, Iowa
Since I began the use of your More Eggs Tonic 2 weeks ago I am getting 45 eggs a day, and before I was only getting 2 or 3 a day. Yours truly, DORA PHILLIPS.

"Doubles Egg Production"

E. J. Reefer: Paradise, Texas.
I have been using More Eggs Tonic 3 or 4 weeks and must say it is fine. My egg production has been doubled. J. C. KOENINGER.

"48 Dozen In One Week"

Dear Mr. Reefer: Woodburg, Tenn.
I can't express how much I have been benefitted by answering your ads. I've got more eggs than I ever did. I sold 42 1/2 dozen eggs last week, set 4 dozen, ate some and have 1/2 dozen left. From your friend, MRS. LENA McBROON

"Increase From 8 to 36 Eggs a Day"

E. J. Reefer: Shady Bend, Kansas.
I am well pleased with your More Eggs Tonic. I was only getting 8 or 9 eggs, now I am getting 3 dozen a day. Yours truly, WM. SCHMIDT.

A Million Dollar Guarantee

Absolute Satisfaction or Money Back

National Bank of the Republic

KANSAS CITY, MO.

TO WHOM IT MAY CONCERN:

Practical Peach Peeling Machine. See Article Third Page

Co-operative *economy* in grain handling

THE CALCO GRAIN LOADING STATION is the connecting link in the progressive bulk handling movement in California. Mills have invested thousands in bulk handling equipment. Harvester manufacturers are supplying bulk handling attachments at a low cost. A storage and shipping elevator at a convenient railroad siding is necessary—the Calco Loading Station meets that need at an unusually low cost per bushel capacity.

A Compact, Efficient Unit

This illustrated unit has a capacity of 25,000 bushels, or the average crop of 1000 acres of grain.

Operating at a speed of 440 feet per minute, its elevator belt has a capacity of 1000 bushels per hour. The grain is dumped from wagons or trucks into a receiving pit, capacity of 316 bushels, elevated to the tower where it is cleaned—all weed seed, cheat and other debris removed—automatically weighed and either turned into a storage bin or loaded directly into cars, through chutes, for shipment in bulk.

This loading station has a concrete base with four bins made of Armco galvanized iron and a tower constructed of corrugated iron—it is strong, fire and vermin-proof. Its four bins will care for 17 standard cars of grain, or the equivalent of 11,750 sacks.

Erected at a Low Cost per Bushel Capacity

This Calco Grain Loading Station is designed for erection at a railroad siding—either by individuals or a co-operative organization of grain growers.

It may be erected for between 28 and 30 cents per bushel of storage capacity. This is about one-half the cost of erecting a unit of similar capacity of concrete.

The Calco Loading Station is equipped with a 7 to 10 h. p. motor and 8 by 5 Minneapolis buckets on 12-inch centers.

It will easily care for the cut of the average combined harvester cutting from 30 to 50 acres per ten-hour day for a continuous period of 250 hours of operation.

The Calco Bins in this unit are 22 feet 1 inch in diameter by 21 feet 5 inches in height.

The illustrated Calco Grain Loading Station may be enlarged in capacity by simply erecting additional Calco Bins. One order is now being planned comprising 12 Calco Bins—giving the unit a storage capacity of 75,000 bushels of bulk grain. Write for details and blue prints of the Calco Grain Loading Station. Our engineers will gladly assist you in every way to adapt this unit to your own particular needs.

Perfect Peach Products Building Big

IN 1914 George C. Roeding prepared for Cultivator readers an article on the peach and how to grow it, and, being a practical man and especially a practical planter of orchard trees, he devoted some little attention to planting, pruning and everyday steps in orchard management. But as we look back over this article at this time it appeals to us that the more important part of it had to do with the quality end of peaches rather than with their culture. Mr. Roeding wrote:

"If the man who consumes your stuff refuses to buy because its appearance is against it, what prospect is there for better returns? He is the man you have to reach. How are you going to do it? By offering an article of food which is not pleasing to the eye? Correct this one fault and you will be surprised to see how quickly the situation will change.

"Are you going to raise the level of your product by offering the same old article year after year or are you going to be the first one to deliver the punch, and how are you going to go about it?

"When a man is engaged in a commercial business, if he is going to stick he realizes that he must induce the fellow who has the money to buy to head his way. After he has a taste of the stuff he has to sell he employs every legitimate means at his command to cause him to call for more. There is nothing wrong with the peach business except that the word 'more' has been forgotten. Dried prunes and apricots are immense factors in the California fruit trade, why should peaches lag? What is wrong? The answer is, 'Nothing, except that fuzzy skin.' It is just that one thing that curtailed our trade with Europe. The greater part of our prunes and apricots are exported, and this same market and our own would take our peaches if you remove the fuzz.

"You believe it, and so do I, that when this market was being vigorously developed three years ago, and dried peaches reached the very remunerative prices of nine and ten cents per pound, Europe was buying freely of our stuff.

"What stopped it? Not hard times, but simply that fuzz, to which our European friends made such serious objection that exports became very small. How many people would eat canned peaches with the hide on? Then what is the use of expecting them to take them when there is no mitigating sweet syrup to neutralize this skin when the peaches are dried? In my opinion peeling of peaches will solve the problem of marketing. It is easily done. Even a small grower can do this work to good advantage.

"All that is really necessary in the way of appliances is an ordinary prune dipper, in which one pound of lye is dissolved in 15 gallons of water. The lye water should be maintained at boiling point and the peaches, after being halved, placed in this solution for about one minute. The fruit should then be dumped into a tank of cold, clear water, which should be changed occasionally, when the skins will immediately slough off. The sulphuring of the fruit should be carried on in the usual manner employed for peaches not so processed, but should not exceed four hours. The sulphur bath is of sufficient duration when the syrup collects in the cup of the fruit. One important point which should not be overlooked in order to have a first-class dried article is to have the trays clean."

The small grower may have at times endeavored to respond to such an appeal as the above, but real success did not come in a satisfactory product until cooperative effort gave power to far-seeing people and a method of work was devised which is resulting in a product which "tastes like more." The most important feature of this process is shown in the illustration on the cover of this issue.

That illustration shows the practical peach peeling machine. The method is entirely different from that referred to by Mr. Roeding. That is the old lye process still in use by canners, but the California Peach Growers have devised and patented a machine and method which is not only practical and economical but produces a product most attractive to the trade.

We have asked J. P. Kane of the department of standardization and inspection of the organization for information regarding the peeling process. Mr. Kane says:

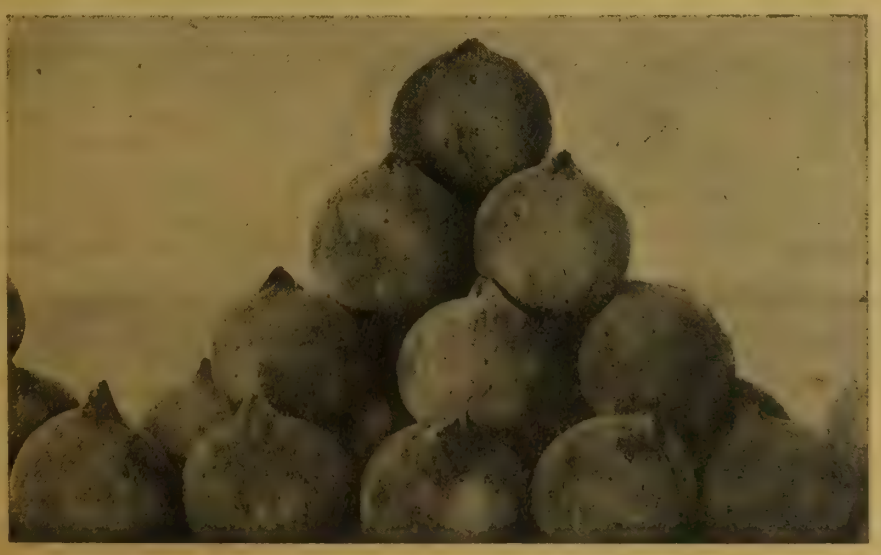
"We would advise that this process is strictly a mechanical one, and no chemical is used in connection with it. The peaches are peeled after they have been dried by the farmers on the ranch, and this is the only process of which we know, by which peaches can be peeled in that condition.

"The exterior view of the peeling machine is the only one we were able to make, the interior showing the mechanical arrangement, being so dark as to make it impossible to photograph.

"The dried peaches are conveyed by means of belts to a vat, where they are subjected to a warm bath, and thence conveyed to a machine where the peeling is removed. After leaving the peeling machine, they are conveyed to a wire cloth screen, where the excess water is shaken off, and are then conveyed, by belts, to a hot air chamber for the further evaporation of moisture.

"The peaches are then dropped through a chute onto trays, and placed in a sulphur house for sulphuring. This process of sulphuring requires some two or three hours. It insures the fruit being preserved for a great period of time, and also assures its retaining its original color.

"After sulphuring, the peaches are conveyed, on trucks, to tables where the trays are dumped, and girls are employed in filling cartons with peaches. The filled cartons are then carried, by endless chain, to the sealing machines.



"By our peeling process we are able to remove 90 per cent of the fuzz and peeling from the dried peach, and this product packed in sealed sanitary cartons is fast taking a high rank among the fruit products of the world. The presence of the undesirable fuzz and peeling has always been a great handicap in marketing dried peaches, particularly in the better markets. The demand for practically peeled peaches is indeed encouraging and in fact the supply is not quite equal to the demand. With the outlook for marketing dried peaches in the peeled state so promising, there should be no hesitancy on the part of the prospective grower to plant peaches.

"Of the drying varieties of peaches, we recommend the Muir, as we have found that it is the peach that is best adapted to our peeling process. The Muir is also a prolific bearer, developing a high percentage of sugar, dries heavier than most varieties, retains its rich golden color for a long period of time, and is in greater demand by the buying public than all other dried peaches. The Muir is also being used more and more each year for canning purposes. Next in order we would recommend the Lovell, a variety similar to the Muir, somewhat darker in color and well adapted to peeling. This variety matures some two weeks later than the Muir and is a very desirable product."

Delivering the Finished Product

Cartons of peeled peaches being carried along a belt, where the girl in the checked skirt catches and places them in large shipping containers. Practically Peeled Peaches are packed in three sizes of cartons — eleven ounce, two-pound, and five-pound. The picture shows the handling of the eleven-ounce cartons. These are packed 48 to the case.

We believe the entire cost of perfecting this great organization is more than met in the advantages it has given to the California peach industry through the perfecting of this process. A vastly greater market has been developed, better sales and better prices are being secured because of the more edible product. While the prices of the past year may possibly not obtain indefinitely we do not believe there was ever a better outlook for the peach industry than there is today. The question now is not so much that of securing a market for a high grade product as of securing the high grade product for the market. There is no peach growing section of the world that can compete in the matter of quality with those from the sun kissed valleys of California.

There always seems to be a desire, especially on the part of the newcomer in the orchard business, to produce sub-tropicals or fruit comparatively rare. There is a general feeling that rarity must mean an assured market when the fruit can be produced, but when it comes to the money making fruits year in and year out staples hold the record, and amongst the staple fruits peaches are in the front ranks.

The 7000 members of this great corporation should be doubled. California's wealth should be increased. Peaches will do it if they are planted right, cared for and then either dried or canned so as to keep the true California quality.

Agricultural News Notes of the Pacific Coast

Northern California

All Sonoma County is wearing masks again.

California rice men are appealing for restoration of rice tariff.

W. J. Pleasants, a '49er of Solano County, has just passed away.

Directors meeting Glenn County farm bureau is being held at Willows today.

An irrigation district has been organized at Round Valley, Lassen County.

Farm Adviser Ralph D. Robertson of San Joaquin County, has died of influenza.

Special beekeepers demonstrations have been held in Glenn County the last week.

Montgomery Gates has been reelected county horticultural commissioner of Solano County.

The farm bureau center at Concord, Contra Costa County, is planning a poultry show, February 7 and 8.

A grass seed trap has been invented by a Glenn County man to remove seeds of all kinds from irrigation water.

One hundred and thirty-two men are taking the tractor course now being given at Elk Grove, Sacramento County.

Twenty thousand sheep belonging to the Miller & Lux Company have been shipped from Galt to pasture at Los Banos.

All farm bureau centers in Sacramento County have become community councils to act with the state council of defense.

The State Grange at its annual meeting in Ukiah went on record as endorsing the work of State Market Director Weinstock.

Butte County's best rice lands are now commanding $45 per acre per year rental; half cash in advance and balance on crop mortgage.

Sacramento Valley now irrigates 250,000 acres of land, and it is estimated that she has sufficient water, if all conserved, to irrigate ten times that amount.

The Pacific Rice Growers have sent a telegram to Food Administrator Merritt, who is now in Washington, protesting against the removal of embargo on Japanese rice.

At the meeting of the California Wool Growers held at Davis last Thursday, President Ellenwood gave report of the convention of the National Wool Growers which he attended recently at Denver.

The smaller cattlemen of Eldorado County are forming cooperative live stock associations for the purpose of uniting in securing grazing privileges in the national forests. One hundred and fifty cattle have been signed up.

It is announced that the capacity of the big rice mill of the California State Rice Milling Company at Sacramento is to be doubled. This will give California the largest rice mill in the country, which distinction has formerly been held by a mill at New Orleans.

County Horticultural Commissioner Mills of Butte County reports that county's output of almonds in 1918 as 400 tons as against 125 tons in 1917. The output of prunes was 2400 tons, but we note that only 40 per cent of prunes harvested were good, this on account of the early fall rains.

Central California

Fresno County wants more hogs to eat up waste products.

The California Peach Growers has just sent out a dividend.

Stanislaus County had 1300 acres in sweet potatoes, beans 17,000.

Cotton picking is going on in the cotton fields east of Kerman.

Santa Clara County is preparing to wage a fight against squirrels.

San Jose Grange has elected I. J. Church overseer to succeed Mrs. Alice Abbott.

The Stanislaus County board of supervisors has ordered the wearing of flu masks.

The Kerman farm bureau is making plans for a community auction sale, probably on February 18.

The Kings County Poultry Association called off its show which was to have been held January 17.

The Aromas farm center, San Benito County, has decided to merge with the community council.

The California Farm Bureau Marketing Association makes auction sales of live stock for members for one per cent of the gross proceeds.

The Turlock Merchants and Growers' Association is conducting its election of directors through the mails. Thirty directors are to be selected.

Grain farmers of the San Joaquin Valley are generally fitting themselves with bulk handling equipment which will mean great reduction in harvesting and storage costs.

The Associated Raisin Company finds that vastly better returns are secured by making known one brand or trademark than, as formerly, private brands.

H. J. Faulkner has been appointed manager of the Milk Producers' Association of Central California, succeeding Lowell Gum, who died recently of influenza.

Kern County farm bureau has 675 members. Of the local associations Kern Delta, McFarland and Wasco have the largest memberships, each having 107.

February 22 has been named as the date for the Seventh Semi-Annual Sale of the Kings County Poland-China Breeders' Association. Eighty head will be offered for sale.

An election is to be held at Turlock in the spring to decide on the admission of the site of the California Peach Growers' plant to the city. The plant now has the use of the city water and sewer systems.

The December report of the cow testing association of Stanislaus County shows 1924 cows tested. The record for best average herd was made by P. Hansen of Ingomar, with 1.88 pounds of butter fat per day.

Farm bureau meetings in Kern County will be held at Weed Patch, February, 3; Kern Delta, 5; McFarland, 7; Delano, 10; Wasco, 12; Rio Bravo, 13; Edison-Fairfax, 14; Pond, 19; Rosedale, 21; Shafter, 26; Arvin, 28.

The last report of State Veterinarian Keene maintains that the state dairy law providing for tuberculin testing has enabled the veterinarian to secure far better sanitary control. Dairies to the number of 9501 were tested.

Southern California

Talbert ranchers are planting beets.

Two new cotton gins are being erected in Palo Verde Valley.

The Imperial Valley Milk Producers' Association has 550 members.

Picking oranges began again in the Redlands district on Monday the 13th.

Holtville, Imperial County, hopes to have a new rural delivery route north of the Highline.

The tractor school is now in session at Hemet, Riverside County. It will end February 1.

The El Centro Pima cotton gin is turning out an average of nine bales of cotton a day.

The Ventura County farm bureau met at Ventura court house January 9 and planned work for 1919.

Alfalfa and milo growers of Brawley, Imperial County, are planning the formation of a marketing association.

Olive pruning demonstrations have been held in San Diego County the past week at El Cajon, Jamul, and Fallbrook.

The Elsinore cannery has finished its season's run on pumpkins and is closed until spinach is ready, probably in April.

The Central Lemon Association at Villa Park, Orange County, has secured net returns of $4.27 at the tree for the crop of 1917-18.

A movement is being started in Ventura County to ask the legislature to build a road through the Cuyama from Ventura to Bakersfield.

San Fernando Valley farmers who still have their beans stored in warehouses awaiting sale are planning to put in corn and milo next year.

The T. C. Dwire poultry ranch in Lankershim has been selected by the state university as one of its 12 experimental farms in Los Angeles County.

The Arlington Poultrymen's Association offers a $50 reward for evidence which will convict chicken thieves. C. R. Brown is president for the coming year.

Orange picking was stopped in the groves of members of the Covina Orange Growers' Association after the freeze to make sure that no frozen fruit was shipped East.

Market Director Weinstock is endeavoring to organize alfalfa and milo growers of Imperial Valley. The California Alfalfa Growers' Association is also endeavoring to secure more perfect cooperation in the valley.

Riverside County farm bureau meetings: Perris, Friday, January, 17; Corona, 20; Murietta, 22; Elsinore, 23; Jurupa, 24; Banning, 28; Coachella, 29; Blythe, 31. Monthly meeting of directors was held last Tuesday.

Growers of early grapes in the Coachella Valley have decided to ship the coming season in lug boxes instead of baskets. Some grapes were so packed last season and brought better returns than the basket packed. They cost less also to put in shape.

The Los Angeles County farm bureau is arranging meeting of live stock men at the Elliot Brant Ranch at Owensmouth for Thursday, January 23 at 1:30. The value of the pure bred sire will be one of the chief points discussed. The meeting will be in charge of Assistant Adviser Scribner.

The Coast and General

Recent freezes in Texas have seriously damaged truck crops.

Only certified seed potatoes can be shipped into Oklahoma for planting purposes.

Yakima Valley beet sugar growers are organizing a cooperative marketing association.

One hundred and forty thousand sheep are grazing on desert flats in eastern Elko County, Nevada.

A 200,000 acre ranch near Great Falls, Montana, has been sowed to wheat. This tract is Indian lands.

The Washington state legislature has been asked for $60,000 for permanent improvement of the state fair grounds.

Floods in northern Sonora have washed out road beds and prevented the marketing of winter tomatoes raised in Mexico.

A turkey raiser of Klamath Falls, Oregon, has fattened his turkeys successfully on mountain range where they get pine nuts.

Shipments of lettuce from the Salt River Valley of Arizona will begin about January 15. There will be a total of about 75 cars this year.

The Washington state highway commission plans a continuing bonding system which calls for a five million dollar improved road fund for a period of six years.

Governor Campbell has appointed Hon. Andrew Kimball of Thatcher and W. H. Robinson of Chandler members of the horticultural and agricultural commission of Arizona. The dean of the college of agriculture is the third member.

The food administration has announced that there will be no restriction on selling of hens the coming spring. This announcement is made to prevent the breaking of the market by rushing poultry on the market ahead of the anticipated order.

Milo is the most popular grain sorghum in the Salt River Valley of Arizona. One man who has carefully selected his seed for several years reports a yield this year of 4090 pounds of the seed per acre and another field yielded 4900 pounds to the acre.

Charles P. Punchard, landscape engineer of national parks, has recently visited different parts of Arizona, including the Grand Canyon. A bill is now before congress making the Grand Canyon a national park, and it is expected that the bill will soon become a law.

Cotton growers in the Salt River Valley of Arizona predict that the acreage in cotton next year will be about the same as this year, or approximately 70,000 acres. There is a noticeable tendency to rotate crops somewhat, and much land in cotton this year will be sown to alfalfa this spring, and a considerable acreage of land that has become badly infested with Bermuda will be planted to cotton.

Considerable damage has been done at times by the breaking of the Arizona canal, the largest canal in the Salt River Valley. The breaks are caused by flood waters of Cave Creek, which sweeps over the canal and overflows into the farming districts. The Water Users Association recently voted to move the canal a quarter of a mile north, which will, it is believed, remove the danger. The estimated cost is $35,000.

Caprifigs and Caprification

By I. J. Condit

CAPRIFICATION is the process of transferring pollen from the male or staminate flowers of the caprifig to the female or pistillate flowers of the edible fig. Whether this process is accomplished by means of a toothpick, a goose quill or glass tube, or by the female Blastophaga, the result is the same, namely, the pollination of the stigmas and the subsequent fertilization of the ovules. It is not definitely understood why some edible figs require the stimulus of pollination in order to set fruit while other figs do not require it. It is difficult to understand why the first crop of figs of the White San Pedro set without caprification while the second crop of figs drop off if not caprified. While these facts are at present unexplainable, the growers of Smyrna figs have long ago realized that the measure of their success depends to a considerable extent upon an abundant supply of capri figs and the effectiveness of the same when distributed in the orchard. It is not the purpose of this paper to describe the life history of the Blastophaga, the three crops of the capri fig, or the detailed methods of caprification used in the orchard. These subjects have been very satisfactorily handled by Mr. G. P. Rixford in his recent bulletin on "Smyrna Fig Culture" and by other writers. I wish, however, to emphasize a few points which I believe some growers have entirely or in part overlooked.

True Commercial Smyrna Fig

Tree with man standing by it is the Smyrna, or as Mr. Roeding would say, Calimyrna type of fig. Other trees are White Adriatics. These were all planted the same year. Note difference in vigor and bearing surface.

Planting Caprifig Trees

It is now generally agreed by planters of Smyrna figs that 4 or 5 per cent of standard varieties of capri trees is sufficient. A common practice has been to set the trees in a group on the northwest corner of the orchard or on the side from which the prevailing wind blows in June so that the insects will be carried into the orchard. Theoretically there should be very few insects lost as the capri figs are picked just before or just after the first female Blastophagas issue and are then carried to the Smyrna trees. Practically, however, most growers are finding it difficult if not impossible to keep the mature capri figs picked closely, and literally millions of insects escape, swarm among the capri trees, and perish without having had a chance to enter a Smyrna fig. Planting on the windward side therefore has its advantages.

The late Mr. Markarian advocated strongly the planting of capri trees in a row through the orchard. On a twenty acre tract he would have planted two rows each way, alternating a capri tree with a Smyrna tree so as to have about the right proportion of four or five per cent of capri trees. In this sort of planting the maximum vlaue of the capris and the issuing Blastophagas would be gained with a minimum of effort. The Smyrna figs next to the capri trees would become caprified naturally during the time insects were issuing from that variety of vapri. The difficulty would be in getting an even distribution of capri figs throughout the orchard. The capri trees in this as in many other plans for planting occupy valuable orchard space which should be producing a profitable food crop. It must be borne in mind that there is no waste space in an Adriatic fig orchard. Every tree which is in a thrifty condition is an income producer. In a ten acre Smyrna fig orchard with the trees 33 by 33 feet, there would be approximately 400 trees, 380 Smyrna trees and 20 capri trees. The 20 capri trees are maintained as absolute non producers of food in order to make it possible for the remaining Smyrna trees to bear an edible and remunerative product. For this reason I believe that capri fig trees should be planted wherever possible in groups by themselves near buildings, along ditch banks, on rocky hillsides, in fact on any tract of ground where edible figs can not be so profitably grown. However, where there is no waste land available for planting capri trees they must be set according to the best plan available. I believe the plan of establishing orchards of capri figs in each community on land otherwise of little value should be encouraged so that valuable orchard land can be devoted to the production of a marketable food.

A Roeding Caprifig Tree

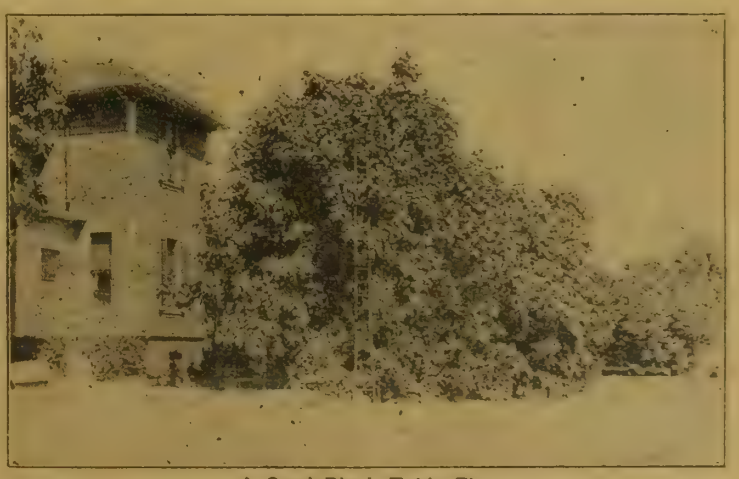
Cost of Caprification

During the past few years the substance of the following statement has appeared in various publications, including the recent bulletin by the department of agriculture: The cost of caprification does not exceed two cents per tree or from $1.00 to $1.25 per acre. Since I have had no definite figures to compare with those given, I have accepted them as approximately correct. I believe, however, they are very misleading in not representing all the facts in the case. In a farm management estimate of the cost of producing any given crop it is necessary to include the value of all the items used in the production of that crop whether the material is bought in the market or produced on the farm itself. Thus if a farmer applies on an acre of garden truck, five tons of manure from his own barnyard, he should logically charge himself with the market value of the manure as entering into the cost of production of the truck crop. Similarly the value of the capri figs themselves should be considered when estimating the cost of production.

Capri figs certainly have a market value. Mamme figs to colonize capri trees in April are sold at prices ranging from one cent to even ten cents each. Profichi figs were quoted and sold in 1918 at $5.00 to $10 per thousands. It is common practice throughout the San Joaquin Valley to buy early capris from some warmer section in order to caprify the first of the Smyrna figs. Many growers are accustomed to supplement their own supply of capri figs with figs purchased from neighbors, from the crop of trees contracted in advance, or from some distant locality. Newspaper reports which have since been verified stated that the Merced district during 1918 shipped in 325,000 capri figs. Of this number 50,000 were obtained from Reedley at $10 a thousand and the remainder from Ceres at $6.00 a thousand, the total cost being therefore $2150 for the season. One grower used 80,000 capri figs on 12 acres. Had he been compelled to purchase these at the prevailing market price, the cost of the capri figs alone would have been $480, or $48 per acre. I wish it distinctly understood, however, that I am not presenting these figures to discourage the growing or the planting of Smyrna figs. What I do want to emphasize strongly is the extreme importance of providing a more plentiful supply of capri figs so that the market demand and consequent price will not be so high. Furthermore, if a community capri fig orchard can not be established, the individual grower should make adequate provision on his own or neighboring place for an abundant supply of capris in order to avoid the difficulty and expense of securing them elsewhere.

Efficiency or Value of Capri Figs

The efficiency or value of a capri fig depends upon several tihngs which we shall enumerate and describe as follows:



1. The number of female insects developed from the galls and the number of galls. Records of the number of insects actually issuing from capri figs include the following:

	Females.	Males.
Roeding No. 3	955	21
Milco	856	104
Roeding No. 1	825	42
Roeding No. 2	781	51
Markarian No. 2	778	70
Markarian No. 1	772	81
Stanford	756	43
Roeding No. 4	733	7

The highest number of galls found in any capri fig so far studied by the writer was 2272 in a seedling fig. A Roeding No. 3 fig contained 1614 galls; a Markarian No. 2, 1326 galls; a Roeding No. 2, 1278 galls; a Milco, 1375 galls; Maslin 147, 1533 galls. G. P. Rixford states that good Milco profichi figs have been found to contain 1200 to 1600 galls.

2. The amount of viable pollen produced. The female Blastophagas are absolutely of no value unless they are dusted with viable pollen. We have no evidence to lead us to believe that the viability of the pollen grains in the different varieties differs to any extent. We do believe that the via-

OUR ADVERTISERS RELIABLE

We guarantee our subscribers against loss through dishonesty of any advertisers in the Cultivator. We do not attempt, however, to adjust trifling differences between subscribers and honest, responsible advertisers, nor will we pay the debts of honest bankrupts. Notice of complaint must be sent us within 30 days from date of the transaction, and the subscriber must have mentioned the Cultivator when writing the advertiser.

THIS WEEK'S COVER

The big bunty looking machine illustrated on the cover this week is really a whole lot more imposing than it looks. We believe we are entirely correct in saying that it means millions to the prosperity of California. It's a peach peeler though it does not peel peaches according to the generally accepted idea of peeling, but it does remove the fuzz and even the skin from the dried peach before it is sent to the market. Most interesting information is given regarding the process on third page of this issue. The advantages of this process are not only in the fact that an individual product is raised in quality and there is secured for the grower and for the state a slight increase in the pound price, but in the additional fact that this increase in quality will mean greater demand.

We have tried "practically peeled," and they are not only practically, but perfectly, satisfactory.

BULK THE GRAIN

With sacks at 32 cents a great impetus has been given to labor saving bulk handling of grain. There have been sufficient arguments in favor of its introduction for many years, but the impetus of these prohibitive sack prices and the war needs has been required to bring it into actual operation in all parts of the state sufficiently to show its working advantages. We believe all the larger grain handling sections will soon be using successfully this method.

FUEL REGULATIONS

Restrictions under war measures and the stringent regulations made by the federal fuel administrator for California will pass on February 1. This particular measure has been of little interest to California because of the slight demand excepting in the manufacturing sections. The removal of restrictions has to do with use and price regulations on coke and coal; also with wholesale margins and purchasing commissions.

CITRUS INSTITUTE

The management of the ninth annual National Orange Show which will be held in San Bernardino, February 14-23, announces a citrus institute under direction of Dr. H. J. Webber. A two-day program has been arranged, and various topics of interest to citrus growers will be discussed.

It has been the custom of these citrus fairs to include in their programs discussion of citrus matters, and while conditions are not always the best it is a favorable time for talking over some citrus methods.

THE WEATHER

We are beginning to feel somewhat concerned over the activities, or rather lack of activity, of the weather man. He seems to have made an honest effort during the past week, however, and up at Eureka, where they don't need any rain, there was precipitated over four and a half inches. But south of San Francisco not sufficient has fallen to thoroughly lay the dust. At Red Bluff, up to Saturday night, .55 inch was precipitated and at Sacramento one-fourth inch. Southern California rainfall still leaves the grain fields yellowing and the hillsides petitioning for more. Compared with last year at the same date, this season is vastly better in its performance. Still the time is come when we want a liberal precipitation.

PURE FEEDS

California has its pure food bill, its pure insecticide bill; likewise fertilizers are protected, but seeds and feeds are left so as to give the farmer the pleasure of a gamble as to what he is getting. The live stock men are getting tired of their end of the game and are demanding a pure feed bill, and they are demanding it with that energy that indicates success. Hogs is hogs these days and yet their H. C. of L. causes the farmer to make every turn possible to bring them across and leave a bit besides paying for the feed. The recent San Francisco meeting gave impetus to the movement before the state legislature, and President Cunningham of the Swine Breeders and others who are pushing for this bill are to be congratulated on the campaign they are making.

NITRATES A-PLENTY

Regarding statement by a contributor to this paper in which "approaching exhaustion" of nitrate beds of Chile is referred to, we may say that such a statement need give little concern to producers who find it necessary to use nitrate of soda to secure greatest returns from their land. We are informed that rather than being exhausted within the next quarter or half century the nitrate beds of Chile will be producing for 300 years to come. Expressed in tons, it is even stated that there are now known and surveyed beds in which are deposits of 720,000,000 tons. The principal concern at this moment is to secure distribution of the few thousands of tons which shipping facilities will permit bringing to this country. Fortunately, the slowing up of demand for nitrates in the manufacture of war munitions and the diversion of much transatlantic shipping to the South American trade is permitting larger quantities to be delivered for farm use. The small quanity of nitrates on the Pacific Coast is being distributed at prices which are not excessive and we believe another few months will see nitrates a-plenty for all demands.

PLANT FIGS

The department of agriculture recently issued a bulletin calling attention to the fact that this country is now importing 16,000,000 pounds of figs annually. These imports will ultimately be supplanted by the home-grown product.

"The area in the Southwestern states and in California is equally adapted to the fig industry, the bulletin adds, as is the Meander Valley of Asia Minor, and is more than extensive enough to produce many times the quantity imported into this country. The annual production of Smyrna figs in California, which is almost the total yield of this country, is not far from 2000 tons, but within a few years the production likely will be greatly increased, for it is estimated that since the importations were cut off as a result of the war, 10,000 acres of Smyrna figs have been planted in the central San Joaquin Valley. When these large plantings come into bearing this country will be independent of importations of this most wholesome, sugar saving fruit, and, it is believed, dried figs by the carload will be as evident in commercial movements as raisins are at the present time."

California's planting this year will probably be one of the largest yet made and shows that California will answer the country's call to produce the country's needs at home.

USE THE STATE FARM

There seems to be a tendency on the part of the live stock interests to center their activities around the University Farm at Davis, and it appears to us that every encouragement should be given to such a policy.

There are a great many very excellent reasons for advocating the University Farm for a center. The location is as accessible as any; the equipment is admirable; and the atmosphere about the institution is so charged with enthusiasm for better stock that no one can visit the farm and fail to catch the inspiration of good blood and better methods. Another point in favor of the farm, and one so full of possibilities that it should not be overlooked, is the fact that among the hundreds of students there are a great many who will enter the live stock business, and who probably have not made a definite selection of the breed they will handle, and who will make their decision from what they see of these sales and meetings, and are therefore prospective buyers.

Again, every department of the University is carrying on experiments and demonstrations that are of vital interest to breeders and farmers. Together with instruction for the youth of California, the institution exists for the purpose of rendering service to agricultural activities of all kinds, and live stock meetings and sales will tend to bring the University and the individual closer together and a better understanding of what is going on and what is needed will result. And in this connection we would like to point out that the men in the various departments, and the students, need your kindly advice, criticism and suggestions, about as badly as you need some of the things they have to offer.

WHY BECOME A MEMBER?

On Page 88 of the last issue of the Cultivator, January 18, we referred to Successful Cooperation of the Poultry Producers of Southern California, Inc., in an article intended to show the advantages of cooperating, and especially giving good reasons for cooperating in that particular organization. After discussing the advantages of that cooperative organization under the heads of "Extension of Markets", "Storage of Eggs", "Elimination of Speculation", we referred to the requirements of membership in this particular association and then said: "Naturally there are some drawbacks to such an organization, hence, why become a member?" This was followed by four specific answers to the question—but here steps in Fate and rearranges (not to our liking), the paragraphs, placing the answers first, and ending with the question, for the last two paragraphs as the article appeared in the paper were intended to be placed immediately after paragraph "2" in the same column and immediately before the two line paragraph, "Why should I join—" Both of these questions are then answered explicitly and on the positive side, with the final request: "Do your bit in making that success certain."

Appearing as it did, the quotation given above makes one subscriber think the Cultivator does not believe in joining the association. We ask the subscriber to reread the article arranged as we have suggested.

FIRST VICTORY LOAN

The treasury department is having one long question to handle in the matter of the first victory loan. The war is over; the boys have, some of them, come home and thousands of others are on the way, but the trucks and the tanks and the guns and ammunition which were manufactured in quantities never before dreamed of are still to be paid for. It was not only the good fighting of the boys in France that ended the war, but it was this vast accumulation of supplies behind them which convinced the Germans that the Allies were in deadly earnest. In any case the billions invested by America were well invested. Now we must pay the bill.

The urge of patriotic fervor is to an extent gone and the treasury department is beginning to consider how it may secure fullest support of all America for the first victory loan. A higher rate of interest may appeal to some and at the same time unsettle financial matters along commercial lines. Making of the income absolutely tax exempt, with the higher rate of interest, will probably sell the bonds in any quantity offered, but the effect of such a move on the first three and a half per cents is a matter for discussion. So that many details are yet to be announced, but here are a few facts already given out.

The first victory loan will be a short term loan, probably not more than five years. It will be sold under the same organization and in the same general way as the former loans. Payments may be extended over a longer period of time. The drive will be held in the month of April.

The government has made good and the war is ended. Let's all be 100 per cent Americans.

Meantime, here is a fact of some little interest to all of us: Germany is now digging up good gold coin and has already paid over to the American forces in excess of $3,000,000 as a portion of her bill for the expenses of the American army of occupation. This has been delivered by special trains to General Joe Dickman at Coblenz. If American money had not been available for "an American tank for every 75 feet of fighting front and other supplies in proportion", it may be that special trains might have been running from San Francisco to New York carrying the gold to bear the expenses of a German army of occupation.

Holding Back Oranges

THE period through which various Southern California fruit growers and shippers had agreed to hold back their shipping of citrus fruits ended January 14. Shipping was not generally resumed at that time, however, for many, with fullest confidence in their fruit holding up till later when assurance may be felt by the Eastern market and all fruit command higher prices, have deferred all shipments.

Horticultural commissioners and inspectors in citrus shipping districts have been interested in studying into fruit conditions and holding back injured fruit. This has resulted in some friction, and the three forces that are at work to protect the consumer and the name of California fruit—the food and drug inspection of the bureau of chemistry, United States department of agriculture, the state horticultural commission, and the county horticultural commissions—called a meeting of fruit growers and inspectors and shippers in citrus counties in Los Angeles on Thursday of last week. R. W. Hilts, chief of the western district food and drug inspection, Mr. Mackie of the state horticultural commission, and many county horticultural commissioners and inspectors, as well as growers and shippers attended.

There were shippers present who endeavored to turn the meeting into a court of final resort or into a protest against California legislation but were finally convinced that the only effort of the meeting was to protect California's good name and secure the sending out of a dependable product.

Mr. Hilts of the federal department had a conference with Commissioner Hecke, also with various county officials. The county and state officials are working under the state law, the principal clause of which was given in the Cultivator of January 11. This law does not permit the holding up of shipments, neither confiscations nor any very drastic action other than that it empowers arrest and fine or imprisonment of anyone shipping fruit "which will injure the reputation of California fruit." The officers of the food and drug inspection, however, have power of confiscation providing "adulterated" fruit is sent. As to what constitutes adulterated oranges Mr. Hilts quoted from Ruling 150 issued January 28, 1913, or soon after the former big freeze. A ruling from Washington confirming the former ruling as still in effect, with the additional provision that "if it will in the future show marked drying in 20 per cent or more of the exposed pulp" then action may be taken was read. The entire ruling is as follows:

"It has come to the attention of the board of food and drug inspection that, as a result of a recent freeze, citrus fruit that has been badly damaged by frost is being placed on the market.

"Citrus fruit is injured in flavor by freezing and soon becomes dry and unfit for food. The damage is evidenced at first by a more or less bitter flavor, followed by a marked decrease in sugar, and especially in acid content. Fruit which has been materially damaged by freezing is inferior and decomposed within the meaning of the food and drugs act.

"For the guidance of those engaged in shipping citrus fruit, it is announced that, pending further investigation, the following principles will be observed in enforcing the food and drugs act:

"Citrus fruit will be deemed adulterated within the meaning of the food and drugs act if the contents of any package found in interstate commerce contains 15 per cent or more of citrus fruit which, on a transverse section through the center, shows a marked drying in 20 per cent or more of the exposed pulp."

It is too early in the season for the full drying out to have taken place and the judgment of inspectors will be the only criterion as to amount of drying which may occur in the future.

In order to inspect the shipments as soon as possible and save embarrassment the county officials will interfere as little as is consistent with their duties but will report car numbers and destinations to food inspectors in the East. This permits a car to go forward, and where the shipper has entire confidence in his goods leaves him out of danger of interference. If he has erred in judgment, however, and sent forward a car of damaged fruit, future prosecution is possible.

Shippers feel that there is injustice in this ruling, to this extent at least, that there is no power now given to anyone to make inspection and give certificate. This point, however, was referred to Mr. Warner of the bureau of markets, and he stated that the bureau is now constituted so as to give report by Eastern inspectors of conditions of fruit on its arrival and he hoped that plans now under way would be perfected whereby inspection would be made at both ends. Then fruit going forward may still be protected and not cause financial loss to the consignors.

CITRUS THRIPS

The matter of citrus thrips does not concern citrus growers of California as much as it did at one time for it has been comparatively easy to control this pest by spraying with lime-sulphur. We have asked County Horticultural Commissioner Collins of Tulare for the best formula and he refers to Bulletin 616. This bulletin was written by J. R. Norton and we doubt not may be had by writing to the Department of Agriculture, Washington, D. C. However, Mr. Collins suggests:

"The formula recommended is plain lime-sulfur solution used 1 to 50 and the first application should be made when most of the petals have fallen from the bloom. The second application about two weeks later, and a third three or four weeks after the second, applied liberally at good pressure should control these pests. In severe cases a fourth spray not later than September 1 is advisable.

"The old formula recommended the addition of a small amount of Black Leaf "40" but it has been conclusively proven that this spray is just as effective on thrips without this material, which of course adds considerable to the expense as Black Leaf is expensive at the present time."

THE MINUTE MAN

Tommy: "My gran'pa wuz in th' Civil War, an' he lost a leg or a arm in every battle he fit in!"

Johnny: "Gee! How many battles was he in?"

Tommy: "About forty." — Toledo Blade.

The Recognition of Frozen Oranges and Lemons

By H. J. Webber

AFTER the freeze of 1913 members of the staff of the citrus experiment station made a careful study of the problems resulting from the freeze and some of the information obtained in their study is summarized in the following catechism:

Effects of Freezing on Fruits and Trees

Question: What are the external indications of frost damage on fruit?

Answer: Frosted fruit cannot always be recognized from its external appearance because the inside of the fruit may be injured without causing any change in the appearance of the skin. When the injury has been severe, however, the skin of oranges, lemons and grapefruit becomes spotted. These spots are apparent a few days after the freeze and are most abundant on the outside fruit on the north side of the tree. Frozen oranges in sunny places on the tree become pale in color and sometimes flat on the exposed side. This flattening is also common in frozen lemons. Lemons which have been badly frozen have clear watery patches on the skin. These patches soon become black through the growth of fungi.

Question: What are the internal indications of fruit showing frost damage?

Answer: One of the earliest internal indications of frost damage in citrus fruits is the formation of white spots or crystals of hesperidin. In oranges, lemons, and grapefruit, these are found on the membranes between the segments. In tangerines where they are very conspicuous they are scattered throughout the pulp. These white spots can be found a few days after the freezing and can best be seen by cutting the fruit transversely and tearing the segments apart.

When frozen oranges are cut transversely they often show a pale area part way between the center of the fruit and the skin. The pulp in frozen lemons is somewhat more opaque than in uninjured fruit. In all varieties the pulp cells of frosted fruit tear apart more easily when cut across than is the case with unfrozen fruit.

A month or so after the freezing, the segments of fruit begin to pull apart because of the drying of the frozen tissue. This condition is best seen in cross section. It shows first in fruit which was exposed to the morning sun where it may appear ten days after the freezing. Sometimes, especially with fruit inside of the tree, this breaking down may not begin for three months.

Question: Can injury to fruit be judged by injury of foliage?

Answer: If the foliage is damaged there is sure to be some fruit injury. If mature foliage shows damage, most of the fruit has been rendered worthless. On the other hand, tender new growth may be frozen without ruining the crop.

The absence of foliage damage does not indicate that the fruit has remained untouched. The entire crop of fruit can be frozen without any foliage damage being apparent.

Question: How can extent of fruit injury be determined?

Answer: Spotting of the skin is a fair early indicator of the amount of damage done to oranges. If none of the fruit is spotted there may be injury, as will be shown by the white hesperidian spots within, but there will be good, marketable fruit in the grove.

If the spotting of north side oranges is general, most of the fruit will show deterioration within three months. The spotted fruit is worthless.

If the fruit in all parts of the tree is spotted the crop is unmarketable.

After four or six weeks have passed, sometimes earlier than this, the best way to judge the amount of damage is by cutting fruit from different parts of the tree and from different parts of the grove. Fruit from locations which shows spaces between the septa should be considered worthless. Sometimes the drying out, resulting in the formation of these spaces, is much slower than at other times. Some fruit may remain solid for three months and then begin to break down.

Another means of recognizing frost injured fruit is to pick soon after the freeze a quantity of the fruit that it is desired to test and store in a warm dry place where the temperature is kept continuously at from 80 degrees to 100 degrees Fahrenheit. Sound good fruit increases in specific gravity by the drying out of the skin, and decreases in volume without much loss from the interior. Frozen fruit, however, rapidly decreases in specific gravity as the interior juices pass out through the skin readily and are evaporated without producing much change in volume. Within from four to six days, therefore, poor fruit can be recognized by the rapid decrease in specific gravity.

Question: Does frozen fruit ever recover?

Answer: No cases of the commercial recovery of fruit have been found. Individual fruits have been found in most of the citrus varieties which have shown a development of new pulp cells, but this is not general enough to be of commercial importance. Instead of recovering, frozen fruit steadily deteriorates.

Thorough attempts to assist the recovery of frozen fruit by frequent and abundant irrigation showed that the effort was without avail. Neither did special fertilization give beneficial results.

NITRATES

Again the government announces it will sell nitrates at cost to the farmer. Presumably, as before, it will be necessary for Pacific Coast users of nitrate of soda to "pay local freight from Atlantic ports," which means no "at cost" Pacific Coast produced nitrate of soda for Pacific Coast users. But in addition, regarding the exhaustion of the nitrate beds we have the following from W. Lambert Myers of Berkeley. He asserts that there are plenty of nitrates in Chile and adds:

First of all, there is a vast amount of unsurveyed nitrate ground on the Chilean pampas that is, nevertheless, known to contain immense quantities of nitrate of soda.

Second, grounds already surveyed still contain enormous quantities of nitrate. There are probably, in round numbers, 720,000,000 tons of nitrate in the deposits of Chile and, without doubt, large supplies also exist on lands now but incompletely prospected. Even the surveyed and certified tonnage opened up at the present time ready for extracting is enormous.

The probable life of the deposits is

upwards of 300 years, even allowing for a steadily increasing annual rate of consumption. Moreover, there remains the interesting question as to whether by the end of the ensuing century we may not find that nature shall have by that time manufactured an immense additional amount of Chilean nitrate for the uses of the world. Sir William Crookes' prophesy that the world would starve for lack of bread as soon as the Chilean nitrate supplies were exhausted, has for some years led the chemical public to believe that a wheat famine was in sight, but that time is so far distant that no one living today need have any misgivings on the subject.

CAPRIFIGS AND CAPRIFICATION

Continued from Page 101

bility is affected by shipment of figs in closed containers to any distance requiring more than a day or night trip. For all practical purposes, caprifigs, which when opened show an abundance of pollen when dusted upon the open palm, are of value as far as pollen production is concerned.

3. The season of maturity. Early capris are most valuable since a large percentage of the Smyrna figs are receptive during the first week or so of the season of caprification. The Milco is an excellent capri fig but it is not favorably regarded at least in the Fresno district on account of its lateness.

4. The abundance of the profichi figs produced. In nearly every locality where Smyrna figs are grown certain caprifig trees are noted for the extra large crop of profichi figs which they produce. Such trees should be propagated if the capri figs themselves are of value.

5. The relative abundance of the mammoni and mamme figs. This is not of prime importance since a caprifig tree can readily be colonized in April from neighboring trees if it fails to carry a winter crop. Still a variety is more desirable and valuable if it carries a sufficient number of mammoni and mamme figs than another variety like Roeding No. 2 which carries practically no figs of either crop.

6. Size of the profichi figs. Small profichi figs are more expensive to harvest and contain fewer insects than large figs. The trees bearing small figs may, however, be more prolific than those bearing large figs. Whatever other good qualities may belong to the Pseudocarica caprifig, its small size is certainly not favorable to its success as a variety.

7. Hardiness of mamme figs. The following statement on this point is found in G. P. Rixford's recent bulletin No. 732, page 10: "Careful investigations extending over a period of several years indicate that the ability of a tree to support successfully the mamme crop through the winter is more a question of variety than of climate." Experience seems to show that the Milco will carry a mamme crop through a cold winter if any variety will, and for that reason the Milco is a good variety to insure the so called "carry over" of the Blastophaga.

8. The pulpiness or meatiness of the profichi figs. Some capri figs are said to be "wet," as they contain considerable white meat which prevents them from drying out rapidly. Others are said to be "dry" as the white meat is thin and lacking in moisture so that the figs dry out rapidly. I do not believe, however, that the drying out of the figs is such a detriment as some growers have believed. The scales at the eye of a capri fig open out and stand erect when the fruit matures, leaving the eye open so that all the insects can escape whether the fig is dry or not. It may be that the so-called "wet" figs allow the insects to issue over a longer period than the "dry" figs on account of the greater freshness of the former.

9. Percentage of defective figs. Growers in various sections have condemned Roeding No. 1 on account of the large percentage of "runts" or "punkies" in the profichi crop. These figs contain only a few insects, are light and pulpy, and are of very little value. The Stanford trees at the Markarian Fig Gardens, Fresno, produced in 1918 large numbers of "dummies" and small figs with a mass of flowers protruding through the eye. Markarian No. 1 has a serious defect in the form of peculiar spots or blemishes which appear on the smaller fruits, probably causing them to ripen prematurely.

PRUNING DEMONSTRATIONS

Demonstrations of modern pruning methods, for the benefit of deciduous fruit growers, are being arranged for in the various California counties by county farm advisers and horticultural commissioners. Members of the staff of the division of pomology of the state university are conducting the demonstrations, explaining new ideas in pruning, especially in the pruning of young trees, developed after four years' experimentation at the university farm at Davis. Demonstrations have been given by Dr. J. C. Whitten in Fresno, Kings, Los Angeles and Riverside Counties; by Professors R. H. Taylor and E .L. Overholzer in Sonoma County; by Professor G. L. Philip in Sutter County, and by Professor W. P. Tufts in Yolo, Sacramento and San Joaquin Counties. Demonstrations have been arranged for in Monterey and Santa Clara Counties.

PROF. WOODWORTH HOME FROM CHINA

Prof. C. W. Woodworth of the University of California, who has been for a year in China, has returned to Berkeley. This, his sabbatical year, was passed as a member of the faculty of Nanking University.

A little planning and adjustment makes it possible to change our minds about the "indispensability" of many things.

The Hudson Super-Six $2,200

Choose Your Car—Normal Production Can Not be Restored Before Next June

There are so few Hudsons of any model to be had just now and it will be so long before full factory production is attained that buyers will do well to select their car without delay.

Super-Six production was to have ceased January 1st.

Dealers, in anticipation of the months that new cars would not be available, had taken all we could produce. But the demand for the Super-Six made it impossible for them to accumulate stocks. Deliveries of Hudsons every month since the Super-Six was introduced have practically equalled the output. More than 100,000 Hudsons are already in service.

Had Planned to Sell Used Hudsons

To provide stocks for the future, dealers bought used Hudsons, paying cash for them, so they would have cars to sell during the time when new cars could not be obtained. But even then they were unable to accumulate stocks of used Hudsons.

Thus is again shown the popularity of the Super-Six. Its white triangle has become the symbol of super-quality and super-performance throughout the world.

Hudson production will be resumed as rapidly as possible. But it will be months before we can meet the usual demand. An interruption of at least three months in the output of open models is inevitable.

Everyone knows the completeness of the Hudson Super-Six line. There were nine different types. Recently we added the Coupe, a beautiful four-passenger model, and a new series of the Touring Limousine.

They Are Pattern Cars

Every Hudson model has been admired, envied and copied by other makers. But under our plan there is constant development and so any Super-Six you get today is months ahead of similar types of other makes.

You can probably get a Hudson Super-Six today—perhaps the very model you prefer. In view of the situation, don't you think it best to see what models your Hudson dealer can supply? There is no certainty as to what you can get next spring.

Need you be reminded of Super-Six value. It is the recognized standard of motordom. For three years its leadership among fine cars has been undisputed. Today it carries the added endorsement of thousands who have learned to know its absolute reliability through all the months when automobile service attention was so hard to obtain.

Agrarian Political Party

WE NOTE that a writer, E. A. Bryan, formerly president of the state college of Washington, takes the position that the time has come for the formation of a political party of farmers. He first refers to a former communication of his in the columns of the Washington Farmer, Spokane. This appeared March 29, 1917. The two years have plainly modified somewhat Mr. Bryan's ideas as to the political party, for a recent communication in the same paper refers less to a separate political organization than to an organization which will represent agrarian interests—possibly not all parties. However, here is Mr. Bryan's first suggestion:

"The time is fast approaching when the formation of a national agrarian political party will be worthy of careful consideration. It does not require a close observer to perceive that economic questions are becoming the determining factor in political alignments. The wage earning, labor union faction of society has become pretty thoroughly organized, and already places the aspirations of the group above any past political connections or predilections. Though the farmers and the laborers in the various industries have some things in common, particularly the fact of physical labor, they have many interests which are not in common and which are diametrically opposed.

"The Patrons of Husbandry (the grange) and the Farmers Cooperative and Educational Union, by the terms of their organization are nonpolitical, and, as a matter of fact, their membership belong to all political parties. They are chiefly educational and social, and confine their political activity chiefly to propaganda for certain specific economic ends, such as rural delivery or parcels post. Such organizations must continue their usefulness, but do not quite meet the requirement of a national agrarian party, always with a large congressional representation, the party always aligning itself for offensive or defensive legislation in the interests of its class."

We would certainly take issue with the suggestion which the writer made two years ago, because we do not believe it would accomplish anything for the best interests of the farmer. We have only to refer to the prohibition question. As long as the older ones of us can remember there has been a prohibition party endeavoring to accomplish good for the human race through a separate political party. Its one great aim was the destruction of the liquor traffic, yet its convictions along that line were not strong enough to hold it together when other interests conflicted. For instance, the protective tariff and free trade often provided within its ranks opportunity for discussion. When the free silver question came up it separated the party into two distinct organizations, the "free silver wing" and the "sound money wing." But in time a nonpartisan organization with only one object was perfected and, using the balance of power which often comes to the minority, it has succeeded in sweeping the entire country.

The farmers may center on some feature of their industry which will bring them all together. It may be marketing; it may be through securing an outlet for their products through their own great cooperative factories or packing houses; or it may be along financial lines, but if a political party with all its side issues, including tariff, finance, and everything else is contemplated, only confusion will result. At least that is our candid opinion, and it rather appears from a communication by the same author in the same paper that his opinions have been materially modified. He now writes:

"We have been, for a long time, so accustomed to two great parties with an occasional offshoot of some wild-eyed demagogue that we can hardly conceive of 'groups' which act with solidarity on certain matters while usually acting in harmony with one or the other of the great political divisions. Yet in England and every European country such subgroups are the common thing. It is now evident that we shall have a large group which will throw its weight with one or the other party. I think an agrarian group is inevitable and the sooner it comes the better, if it may not be led by demagogues and socialists. The hope of the agrarian states (west and south chiefly) lies in the United States senate and the dual system. That is to say, for a centuary at least, if the agrarian group were class conscious it could control the senate and the electoral college. A man might either be a republican or a democrat and yet be an agrarian and on industrial lines vote accordingly. The agrarians form the largest single group of people and yet have the least political power. The best section of the agricultural press ought to organize and outline a policy of public education along these lines."

Without question there is need of farmers organizing more efficiently than they now are. There are many organizations with specific work before them but no one organization of organizations. There are two movements on foot today looking toward such an organization of all agricultural interests, but neither of these seems to desire to affiliate; each is insisting that its particular plan is to be preferred. The one great hindrance to getting agricultural interests to unite in any movement is this jealousy or fear that other interests may secure undue advantage.

When we acquire a more enlightened selfishness, then we will get together and stand as one and secure equity.

BEET SUGAR INDUSTRY

A review of the beet sugar conditions in the United States is given in "The Beet Sugar Industry in the United States," by C. O. Townsend, pathologist in charge of sugar plant investigations. This is Bulletin No. 721, a 56 page book which may be had by sending 15 cents to Superintendent of Documents, Department of Agriculture, Washington, D. C. It touches upon beet sugar mills, soil, subsoil, topography, climate and many conditions required for producing beet sugar crops and ends with a list of other publications of the United States department of agriculture relating to sugar and beet sugar production.

GROSS FAVORITISM

Big Seed Company Is Distributing New Catalog

Aggeler & Musser Seed Company of Los Angeles

Issue 26th Annual Book

The Aggeler & Musser Seed Company, the large Seed House of Western America, is distributing broadcast their 1919 Big Annual, which is claimed to be the most complete and finest yet issued.

Among the many new features incorporated is a department on "More and Better Potatoes." Important data is given on Home, School, Field and Demonstration Garden Work. Data concerning correct tools and implements to use for best results. Marketing notes on each subject, telling how and where to market. Hints on poultry, spraying, fertilizing and the use of insecticides. It is in reality several books in one, for it includes the important "Garden Manual." One thousand questions are answered and valuable information on all varieties of plants is given.

The Aggeler & Musser Seed Company have opened a large store right in the center of shopping district, 620 South Spring Street, Los Angeles, a great convenience to rural customers. A special Call Department has been installed to accommodate customers in town for a short time on business. Orders left on arriving are ready when called for. The big Mail Order Department and General Offices are all situated at the new store, while the general milling, cleaning and warehousing will continue at the big warehouse, Sixth and Alameda. The new catalog explains fully all the new departments and why our service has been improved 100 per cent. Sent free, postpaid, anywhere. Write for copy at once.

When Your Tractor Hits the Tough Spots

MAKE SURE in advance that the Tractor you buy will make good on the extra hard job. There's a lot of tough going in a tractor's work.

Most tractors are sturdy. They don't often break down, but they may *lie* down. It's the engine that counts. And the most important thing in keeping an engine going is the ignition. So be sure that the tractor you buy has

BOSCH
MAGNETO IGNITION
WITH BOSCH IMPULSE STARTER

The reasons for Bosch superiority are easy for anybody to see. Bosch is built like a locomotive for strength, like a watch for painstaking attention to detail. It has the ruggedness to stand up. It won't fail you in a pinch.

Bosch design has been developed by years of constant study, based upon experience under all sorts of actual working conditions. As a result its rip-roaring sparks drive so powerfully into the mixture that every drop of fuel yields every ounce of its power.

The new Bosch Impulse Starter ends all Tractor starting difficulties. It starts any engine easily and certainly without the nuisance of batteries or hard work in cranking.

Before you decide on your tractor, see a Bosch Magneto and compare it with other ignition systems. Then you'll surely specify on your order: "Bosch Magneto Ignition." You can have Bosch fitted to your present tractor. A Bosch Service Station will do it for you.

Internationals All Kerosene Engines

EVERY engine in the International line, from the smallest to the largest, operates on common coal oil. Every International engine will develop its full rated horse power, at all times and under all kinds of loads within its capacity, using kerosene for fuel.

In these days of high prices for gasoline, and none too plentiful supply, there is both safety and economy in using kerosene engines.

Add to this the economy that results from using an engine that conserves fuel, that is always ready for work and that lasts so long you forget what you paid for it, and you have some of the reasons why International engines sell so fast.

We have all sizes, from 1 to 15-H. P. Here is a line of real farm engines that no farmer can afford to overlook when he is in the market for an engine. See your local dealer or write to us for complete details about our engines or any other farm machines in the list below.

Easy Ditching

THE "good old days" of a pick and shovel have become memories. Instead of spending a week on a mile of ditch, Mr. Farmer now completes the job in a few hours. He does a better job, too—and saves a BIG LOT of *valuable* time. He does it with

THE Martin DITCHER, Grader and Terracer

GUARANTEED

Makes new ditches; cleans old ones; grades roads; builds dykes and terraces. Cuts alfalfa, Bermuda grass or sweet clover roots from ditch banks, without plowing. Does more work and better work than 100 men with old methods.

Made In Horse and Tractor Sizes

All steel. Reversible. Adjustable. No wheels, cogs or levers. More MARTINS now in actual use than all other farm ditchers combined. Warehouses and distributing points in nearly all Western States. Write for free descriptive catalog and nearest distributing point, together with list of MARTIN users near you.

Gardening in California

Written for California Cultivator By Ernest Braunton

TO GARDEN or not to garden is just as much of a problem in California as it is elsewhere. I have gardened for profit both in California and in northern Iowa and the problem is less complex in the latter state. The gentle spring and summer rains seldom failed and the soil did not bake as it does in California. It was far easier and therefore cheaper to grow flowers and vegetables there than here and the prices there today for such products are much less than in California. Our chief advantage is that we may garden every month in the year. One other is the length of seasons from frost to frost and the hardiness of many plants here that cannot stand freezing weather.

In the states east of the Rockies nearly all plants that bear showy flowers are grown as annuals, for there is no choice in the matter. The beginning of winter sends all but the hardiest trees and shrubs to their final resting place. No soft wooded or herbaceous plant survives even the mildest winters. In this limitation there is a suggestion as to what we should grow. Why should we bother with annuals when we may grow perennials which will endure from year to year, or spring up from roots each spring, roots too tender to pass unharmed through an Eastern winter. When planting larkspurs, phlox, and many others of their class do not sow or plant the annual species, but grow perennials only. Why should we plant anew each year when we may plant for permanence. Every period of three or five years we should divide the plants and dig up and enrich the soil before replanting the divided roots.

But there is a compensation in our gardening that cannot be reaped by soil tillers in lands of ice and snow. We may plant out the young of tender beautiful things and follow them from little tots to maturity of years, stature and crop production. We may associate with our plant pets throughout the year. No period of plant hibernation or semi-hibernation of humans comes to interrupt the loving care we may each day bestow on worthy, reciprocal plants. The growing of fuchsias and others of the class until they cover one side of the house from root to roof endears the plant to the owner so that he feels proud to show them to his visitors. Some such plants have been watched over for a score or more of years, until they become as dear to every member of the family as the favorite family horse in days of yore. When we consider the great blessings incident to our climate we cannot but congratulate ourselves that we live in California rather than any other state in the Union. In the East one is quite suddenly released from restraint of winter and enters upon gardening with an enthusiasm and energy that is not abated until the garden is planted. All is hustle and bustle. Here we do not need to get excited for we may garden deliberately at all times. Yet we are not less enthusiastic than the Easterner. On the contrary, our gardens hold our deep interest throughout the year. Why not, then, make the most of this great gift and garden nobly? California gardens should be the finest, most interesting of all.

Economic Shade Trees

The war has taught us some splendid lessons in economy, but I am afraid we shall soon lapse into our olden habits of wastefulness. Surely the next generation will have forgotten the lessons taught by the war ere they shall be old enough to take their part in the world's battles. But we may still do much that is dictated by experience without barring pre-war claims to favor.

I would not advocate the planting of any but the most beautiful trees for street and garden, but why not choose those also useful as crop producers. One of our best trees, in sections free from heavy frosts, is the carob or St. John's Bread. Few trees are more beautiful and the splendid crop of pods, borne by the better trees, has a heavy value for stock food and incidentally has many uses in the preparation of foods for humans. Aside from liability to damage from frost the tree is very hardy.

Gardens for All

Gardening in California is no class privilege, for he who wills may at all times garden, be his purse ever so slender. No one who is able either to own or rent a piece of ground but may afford the small expenditure necessary to purchase seeds for both vegetable and flower garden. The small investment for flower seeds may be made to cover many years' production. Chosen with good judgment a dollar's worth of seeds will yield good and sufficient flower crops for several years. Those blossoms grown and gathered by one's own hands are

(1)

FOOD PRODUCTION MUST BE INCREASED

The horse is a vital factor in such accomplishment. His efficiency is measured by the degree of fitness for constant use.

Stuffed Collar Pads

Are the only guarantee against bruised, galled and chafed shoulders. They are better than other kinds, being soft, springy and absorbent. They make possible the continued use of a horse collar long after its worn condition would otherwise compel its discontinuance.

New Patented Hook Attachment
(Found only on pads made by us)

Consists of wire staple with felt washer. It gives hook a firmer hold and prevents pulling off, even though fabric is weakened by long usage. The greatest improvement since we invented the hook. Ask your dealer for Tapatco Booklet.

Thirty-Seven Years Making Pads

doubly valuable for he who buys flowers does so to give them away. The bulk of the flowers lovingly tended and refreshed from day to day are grown in the home garden. Floral gifts, unless of unusual excellence, are admired for a moment and soon forgot.

Gardens and Rooms

In the building of small gardens women usually surpass men in artistic arrangement. Too many men will clutter the whole place up with all manner of plants, while woman disposes them in a more orderly arrangement. Seeking a reason for this we find within the house all arrangements are orderly. Piano, bookcase, couch, chairs are placed against th walls, leaving the center open so that one may get about easily and without interference, and every article of furniture is seen to the best advantage and the whole may be seen at a glance, nothing obstructs the several views across each room. As sensibly does she garden, preserving open lawn centers or plot centers and placing the array of tall plants, trees and shrubs, against the fences, making a tasteful display.

Dates and Cocoanuts

A San Francisco reader of the Cultivator wishes to know if dates and cocoanuts grow in Los Angeles or Southern California. Doubtless most of our readers know that large quantities of the finest dates are grown in Imperial County, second to none in the world. No commercial dates are grown in Los Angeles but within a few miles of the city I have gathered dates from the palm that were good to eat and of undoubted marketable value. I fully believe hardy sorts will yet be introduced that will give us good dates in the Los Angeles district, though not, perhaps, of the highest grade. Commercial cocoanuts will never be grown in California. I am certain the palms may be grown out doors in a few sections near the coast, but no nuts will grow on them, or if any fruits set they will not mature. So that when cocoanut palms are grown around False Bay, San Diego, or elsewhere, they will be for ornament only.

Winter Fruits

In spots that are practically frostless there occasionally is a freak plant or two that holds out the hope that we may some day have fresh fruits in midwinter. Fruit trees, vines, etc., that have been kept dry during the latter part of summer have had all the rest or hibernation they need. After the soil has been dry for so long the early winter's rains start life into these dormant plants and they spring into blossom. It must be that such plants are not only vigorous but capable of standing much more cold than we have here. In practically frostless spots these should ripen a fruit crop in very early spring. I am now watching some such precocious plants to see if fruits will follow the blossoms now open. It may be a cold snap will come and chill the blossoms so they will drop before fruits set.

Commercial Floriculture

Every year some one writes to ask how to start in the business of growing flowers and plants for profit. Such a letter is before me now. Such a question cannot be answered within the limits of a farm journal. If anyone knows so little of the practical side of the business that a short article in these columns could enlighten him, he knows too little to engage in the business. Every year there is a greater demand for flowers and plants, but every year many more enter the field. Therefore competition is so keen that only the best informed, most skillful growers will succeed. One wishing to start in the business should first seek employment with some successful grower in order to learn at least the rudiments of the business. If one wishes to study the matter from a large view he should buy "The Principles of Floriculture," by Prof. E. A. White, of Cornell University.

TRACTOR SHORT COURSE

A short course in the management of gasoline tractors will be held at the citrus experiment station, Riverside, February 24 to March 1, 1919.

War time conditions have placed upon the farmer not only the burden of producing foodstuffs for our own people but a surplus must also be provided to be shipped abroad. To produce more it has been necessary to change our methods of farming and today we find the tractor doing its part in this campaign for increased production.

To train tractor operators the University of California plans to give this course in tractor management, duplicating the course given for several years at the university farm, Davis, and also at Riverside last year when over 200 students were enrolled. Shop and tractor work will be offered on such fundamental questions as lubrication, care and adjustment of bearings and carburetors, grinding of valves, repairs and replacements. Several of the leading makes of tractors will be available for demonstrations and practice work.

A registration fee of $1.00 constitutes the only charge for the course. Any one may register. Applications should be sent to the Dean, Citrus Experiment Station, Riverside.

OREGON IRRIGATION PROJECTS

Five separate irrigation projects are now being organized in Baker County by Henry E. Tweed, county agricultural agent of Baker, Oregon. The county agent is cooperating with John H. Lewis, state engineer, in having the projects organized under the Oregon irrigation district law. The projects that are now in the process of organization are the Sparta irrigation district which has 14,000 acres; Bridgeport-Durkee irrigation district, 6000 acres; North Fork irrigation district, 4000 acres; Unity irrigation district, 8000 acres; Medical Springs irrigation district, 4500 acres.

The Sparta project is located 35 miles east of Baker. This land has been taken up as homesteads within the past ten years. However, there are many old ranches that have been there for 30 or more years. Fifty years ago a mining canal was built into this territory when Sparta was known to be one of the big placer mining camps of eastern Oregon. At the present time all the farmers are practicing dry farming. Others of the district also have within their borders some of the older farming districts of the state.

LAWLESS CRIMINALS

We are facing many problems of reconstruction of which the Bolshevist movement is of special importance. While this disreputable organization is composed of hardly five per cent of the population of the Allied countries, nevertheless it is thoroughly organized, ready to leap into the saddle of authority and reap benefits out of the chaos if given an opportunity. It is an organization composed of the worst elements of humanity. Its foundation is greed, envy and malice, and it has nothing but utter contempt for the man who attains success through honest industry. It is the natural enemy of every business man, farmer and all things religious and bases its conduct on the supposed fact that it has been wronged by society and is therefore the natural enemy of society.—Bishop Johnston.

Top Dressing Talks

Early in the war we announced that Arcadian Sulphate of Ammonia had been conscripted for the manufacture of munitions. But now the war is over and with an honorable discharge from war duty, it is again available for use as a nitrogenous fertilizer.

The leading agricultural authorities and the successful growers of California have about come to the conclusion that nearly all soils and nearly all crops will benefit by an application of a readily available nitrogenous fertilizer. Indeed, the question is not whether or not to do it, but what to use and how.

There are half a dozen reasons why Sulphate of Ammonia is the best form of nitrogen to use. We will take them up in later talks.

Use Arcadian Sulphate of Ammonia As a Top-Dressing

Arcadian Sulphate of Ammonia is the well-known standard article that has done you good service in your mixed fertilizers for years past, specially kiln-dried and ground to put it in splendid mechanical condition. Ammonia 25¼ per cent. Made in U.S.A.

Questions and Answers

ANSWERS BY EDITOR AND STAFF

Questions to be answered in this department should be received at the office one week before reply is expected. Write plainly on one side of the paper and sign full name and address. Unsigned communications receive no attention.

Balanced Grain Ration

Kindly advise me through the columns of your paper what you consider a balanced grain ration for Rhode Island Reds and Barred Rocks, also for White Leghorns. Chickens are kept in house and are given wet mash once a day and all the dry mash they care to eat, also two feedings of greens. In addition to this how much grain per chicken per day should be fed and when is the best time to feed it?—Subscriber, San Diego.

The scratch grain is usually fed at night, that is, toward evening when the hens have still time to fill their crops, and a quart of grain per day to 12 or 15 hens is considered sufficient at the experiment stations. Sometimes a small part of this quart a day is thrown in the litter in the morning; sometimes it is all given at night with the expectation that there will be some left in the litter for the hens to scratch out before their caretaker is up. On some commercial plants grain is thrown in the litter after the hens have gone to roost at night, then lights are turned on at 4 o'clock or 4:30 a. m., and the hens work while the caretaker takes his morning nap.

California poultrymen have relied mainly on barley and milo, Kafir or Egyptian corn for scratch grain the last two years, feeding equal parts of each, but sprouting part of the barley. Now that the price of wheat is no longer prohibitive equal parts wheat, barley and milo would be a good ration for Rocks and Reds. For Leghorns Indian corn might be substituted for milo. Equal parts wheat, oats and corn was the ideal scratch feed back East before the war. Here we have never used corn so largely. A. G. Philips of Purdue experiment station says in a recently published article: "In the grain growing regions corn and oats are found on most farms and should therefore compose the larger part, if not all, of the grain mixture. Kafir corn may take the place of corn. Barley is somewhere between corn and oats in feeding value." Some of our California poultrymen consider barley just as good as wheat for laying hens.—J. A. K.

Soil Analysis

Have just moved to Merced County and am anxious to know what crops my soil is best adapted to. Will soil analysis aid me, and where should I go to have my analysis made?—Subscriber, Winton.

Full analysis is expensive and of value only when explained by the chemist. There are agricultural chemists and physicists who advertise in the columns of the Cultivator whose business it is to make both chemical and physical examinations of the qualities of the soil. In addition the University of California located at Berkeley has specialists who will give advice in this matter. Again the farm adviser of your county is prepared to aid in this matter. Also general advice and a pair of open eyes which look freely about the neighborhood in which the land is located to see what crops are succeeding best will give practical information.

Furs

Will you please tell me if there is a market for coyote fur and fox fur? If so, will you tell me where?—Subscriber, Ramona.

There have been fur dealers who have advertised in the columns of the Cultivator and whose business it is to handle these furs. In the issue of December 21, 1918 there are two advertisers, one on page 642 and another on page 652.

Dehorning Young Goat

Is there any chemical which I can use to remove horns from young goat? The horns are about an inch long.—Subscriber, Los Angeles.

The only successful means of removing the horns, unless taken within a few days after birth, is with a sharp saw, cutting down under the skin so that in healing over skin will cover the spot where the horn grew. If a stub is left it will continue almost as much of a menace as the horns. Unless the youngsters are vicious with their horns we would not dehorn milch goats.

Horse Meat

Have read there are meat markets in San Francisco which deal in horse flesh. Please give names of such markets.—Subscriber, Tuolumne.

We know of no such markets though doubt not in large cities there may be trade in such products.

Poisoning Linnets

Can you tell me how to kill linnets? Thousands of them infest my orange and olive trees which are near an apricot grove.—Subscriber, Bloomington.

We always regret giving any suggestions regarding poisoning of bird pests for the reason that so many of the fruit growers best friends are killed by the same process. The most effective method is perhaps the using of powdered strychnine on small pieces of fruit. The trees which are attacked are often protected by the use of fluttering bits of paper, tin or glass suspended through the trees, or a boy with fine bird shot and a shotgun soon makes enough noise to frighten away the birds. The latter is much to be preferred if possible.

Slobbers

What causes slobbers in rabbits and what is the remedy? Rabbits of what age are affected by it? — Subscriber, Garden Grove.

Rabbits of all ages may be affected —cause is overeating of green food causing indigestion or eating some food not being properly digested. It is not considered contagious but it is best to separate those affected by it. Remedy is a pinch of alum in the mouth and a fast of eight to ten hours. Corrective feeding is necessary for such stock—feed some good rabbit tonic thus toning up the organs and preventing a recurrence of the disease.—W. D. W.

TREES

—with roots such as these

are grown only on our foothill soil and location. Hardy-of selected parentage-well-grown-absolutely reliable-and free from root-knot and diseases common to other localities.

We know we can meet your requirements. Our stock of trees is complete. Submit today a list of your wants for special quotations. Remember, behind each tree is our guarantee.

Those who wait will be disappointed. Write now—right now!

Why take chances on your trees when we have made it easy for you? Get the right start. Send for our book "California Fruits"—full of practical, dollar-making information. It is based on 30 years' experience as nurserymen and orchardists, for we operate 1000 acres of orchard of our own. Send for this book today—it's *free!*

As We Go to Press

A wire from Sacramento informs us: "Roma Princess Alcartra, owned by J. S. Gibson Company, just made official record 30.06 butter seven days as senior four. She is sired by Prince Alcartra Korndyke, therefore granddaughter of Tilly Alcartra."

Arizona Cattle Growers Meet

The Arizona Cattle Growers Association has been called to meet in Phoenix February 11-14, especially to consider matters of legislation in conjunction with the legislature that then will be in session. An attendance of 500 is expected by President Mullen.

The cattlemen of southern Cochise County and of northern Sonora have formed an association that is to be made permanent at a meeting in Douglas January 20. D. A. Richardson is temporary president. Line riders have been employed to guard the border against straying stock and thievery.

Fifty miles of the southern boundary line of the Papago reservation in Pima County, along the international border, will be fenced this spring by the interior department.

Very general changes are being made in the personnel of the Arizona live stock inspectors, about 80 in number. E. G. Crabb of Flagstaff is the new president of the live stock sanitary board and E. W. Stephens of Prescott is secretary. R. J. Hight of Tempe is the state veterinarian.

Thousands of range cattle are being taken from southern Arizona ranges to northern Michigan and Wisconsin, to graze on cut over lands, where the grass is said to be sufficient in itself to prepare beeves for the block.

University Jersey Makes Record

Interested Jap's Santa, Register No. 296928 A. J. C. C., record cow for Jerseys in the university farm herd, is making a remarkable showing this lactation period, having produced over 600 pounds of butter fat in seven and a half months from calving. This is nearly 34 pounds higher than her production at the corresponding period last year, when she made the state record of 805.7 pounds.

The authorities at the farm are watching the cow with great interest, and expect she will considerably raise her former record.

E. J. De Pue Dead

Edgar J. De Pue died in San Francisco of pneumonia, following an attack of influenza, during the week. De Pue was president of the California International Live Stock Show. He was heavily interested in farm enterprises and in the warehouse business in the Sacramento Valley.

Shasta Hog Marketed by Auction

In the second sale of fat hogs held at Cottonwood by the farm bureau of Shasta County, 465 head were sold at prices netting the contributors two cents more per pound than had been offered by local buyers. The two hog cars were bought by the Western Meat Company for 15 cents.

Appropriations for State Fair

The directors of the California Agricultural Society are asking the legislature for appropriations to cover a number of contemplated improvements for the state fair grounds.

The directors believe that a new concrete and steel grandstand is necessary for the comfort and safety of the public and are asking for $250,000 for that purpose.

Because of increased costs of construction the $300,000 appropriation in 1917 for the Agricultural Building proved insufficient and an additional $40,000 is needed to complete the building.

For the purpose of acquiring additional land the society is asking for $30,000.

New Guernsey Sire and Dam Supplement

The American Guernsey Cattle Club has just issued a 100 page booklet containing a supplement to their advanced register sire and great producing dam list of all advanced register cows.

The supplement and complete Advanced Register Index may be obtained by breeders of Guernsey cattle free of charge by sending a postal request to the American Guernsey Cattle Club, Peterboro, New Hampshire.

D. O. Lively in Russia

It is reported that D. O. Lively, who was in charge of the live stock show at the P. P. I. E. and who more recently has been engaged in the live stock brokerage and breeding business, is now in Russia on a government mission, and it is not expected that he will return before next May.

Los Angeles Live Stock Slaughter

The United States bureau of markets reports that during November, 14,085 cattle, 3339 calves, 14,866 hogs, 20,481 sheep and two goats were slaughtered in Los Angeles.

1919 Dairy Show at Chicago

At the annual meeting of the National Dairy Association held last month in Chicago, it was decided that the 1919 National Dairy Show will be held in Chicago.

Use With Any Standard Tractor

JOHN DEERE Pony Tractor Disc Harrow

THE JOHN DEERE PONY TRACTOR DISC HARROW is for use with any standard tractor—clevis is adjustable to suit height of tractor drawbar.

Flexible—the front section is equipped with the famous John Deere spring pressure lever and pivoted yoke—the feature that makes possible disking at even depth on ridges and in dead furrows.

Penetrates and pulverizes as desired because low tractor hitch and low coupling between front and rear gangs hold discs to their work.

Light running—no dragging around corners—rear gangs trail properly and run steady because the reinforced goose-neck connection to rear gangs is attached ahead of the front gangs.

Unusually strong—all steel main frame, double bar gang frames, riveted throughout.

Flexible, oscillating scrapers, adjustable to keep discs clean under all conditions. All standard widths, with standard size discs. Easily converted into horse-drawn, single or double-action harrow by using proper hitch.

JOHN DEERE, Moline, Ill.

Get This Big Farming Book FREE

Let us send you FREE, our big 156-page book, "Better Farm Implements and How to Use Them." Full of valuable farming information. A book to which you will often refer. Worth dollars. Tells all about the complete line of John Deere machine listed below.

Aralia De Kol---Foundation Cow

ON THAT fortunate day when A. W. Morris & Sons Corporation, Woodland, decided to stake their future upon pure bred, registered Holsteins they probably had not the least idea that in the foundation herd which they purchased there were three cows that would in future stand out in a manner to turn the eyes of all Holsteindom, in fact the eyes of the entire dairy world toward the Pacific Coast. These three cows were De Kol of Valley Mead, Riverside Sadie De Kol Burke, and Aralia De Kol. Of these, De Kol of Valley Mead is possibly the least appreciated of the trio, for the other two made spectacular world's records and she did not, although she will in time receive full credit for the true greatness she has transmitted to her descendants. Riverside Sadie De Kol Burke was possibly the best known world's record cow developed in the Morris herd up to the time of Tilly Alcartra, for her name became almost a household word in California, and even to this day many people inquire for her not knowing that she long since took up her abobe in Cow Heaven.

Aralia De Kol, the third of the great trio, can now be counted among the foremost foundation cows of the breed, and as her blood is becoming liberally disseminated throughout many of the best herds in the West it is safe to assume that she and her descendants will one day occupy an even higher family position in Holstein history. She is essentially a western product, her sire Ignaro De Kol, and her dam Aralia both having been bred by Paris Gibson, Great Falls, Montana, while she herself was bred by that great agriculturist, the late Mrs. M. D. Eshelman Sherman, Fresno.

Aralia De Kol was well along in years before she fell into the hands of the Morris Company, and had never been developed for great production, but she was naturally a great cow as she proved when at past 11 years of age she was put on yearly test for the first time and astonished the world by producing 28,090 pounds milk and 1142.32 pounds butter in one year, thus becoming the world's first 28,000 pound cow, and winning second prize on her butter record. She held the record but a short time however, when it was taken from her by her mate, Riverside Sadie De Kol Burke, who in turn shortly lost it to Creamelle Vale.

Aralia De Kol was not a show cow, but she was one of the rugged, dependable looking matrons that command attention in any herd. During her year's test she did not make a single world's record up to the finish, although her records of 596.1 pounds milk and 25 pounds butter in seven days eight months after calving won first prize that year and stood as the second highest in the world, but she was a persistent worker and after having been in milk for 13 months was still yielding 65 pounds per day. Freshening again at twelve years six months of age she made 742.3 pounds milk and 30.13 pounds butter in seven days under official test and 3069.1 pounds milk and 122.30 pounds butter in 30 days, winning 42nd prize for butter in seven days and 13th prize for butter in 30 days that year. She was continued on test for the year and made 22,922.6 pounds milk and 950.69 pounds butter, making her the second cow in the world to have made over 50,000 pounds milk in two years and giving her the second highest butter record in the world for two consecutive years. She calved again at 14 years four months in splendid condition and every indication of making a large record, but died suddenly with an acute attack of milk fever.

Aralia De Kol left behind her, to hand down her great blood, three sons and three daughters. Unfortunately all of her sons are now dead, Aralia Masterpiece having fallen into the hands of a man who used him mostly on grade cows and finally sold him to the butcher, Aralia King who has a splendid list of daughters, but who suffered an injury and had to be killed, and her youngest son Aralia De Kol

Aralia De Kol
One year Milk 28,090, butter 1142.32. Two years: Milk 51,012.6, butter 2193.01.

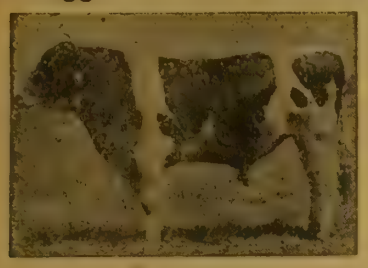
Aralia De Kol Mead
One year: Milk 23,044.6, butter 1215.20 (strictly official). Two years: Milk 39,713.9, butter 2085.81 (includes record as two year old).

Aralia De Kol Pontiac Mead
One year: Milk 18,362.5, butter 932.43 (record made as senior two year old, a California record).

Aralia De Kol 3d
One year: Milk 24,554.10, butter 1100.47. Two years: Milk 42,363.6, butter 1873.40 (including record as junior two year old).

Sir Aaggie De Kol Acme 2nd
Son of Aralia De Kol 3d and sired by Sir Aaggie De Kol Acme. Five of his seven nearest dams average: Milk one year 24,089.88, butter 1105.07. Butter average is second highest in world for any bull of service age. Owned by Alex Whaley, Tulare, California.

Aralia King
Son of Aralia De Kol, and sire of Margaret Aralia De Kol.



Margaret Aralia De Kol
One year: Milk 22,922.70, butter 1161.87. Two years: Milk 37,257.7, butter 1884.89 (including record as senior two). Holds state record 25.85 pounds butter in seven days eight months after calving.

King Aralia Mead
Son of Margaret Aralia De Kol and sired by King Mead of Riverside. Owned by H. E. Vogel, Fresno, California.

SANDERS-BRADSHAW GREATEST HOLSTEIN SALE

Sale will be held under big tent

State Fair Grounds, Phoenix, Arizona, February 5, 6, 7

Owing to large number sold, great opportunity is offered. Cotton growing in the Salt River Valley has made cattle cheaper than other sections, and Pacific Coast breeders and dairymen will do well to attend this sale, because cattle of splendid breeding will be sold.

Special Feature of Sale

Large Number of Heavy Milking Cows

Some of the Peaches and Cream of the state—include, a bull whose three nearest dams average 33.02 butter, seven days.

A bull whose seven nearest dams average 32.26 and who is a son of the famous sire, King Segis P. Alcartra.

A two year old son of the 27 pound two year old daughter of Johanna McKinley Segis.

175 Registered Holsteins

100 High Grade Holsteins

The Grand Champion Show Cow: Frontier Mona Korndyke, butter 22.78, milk 551, seven days.

Many other excellent show animals.
Many A. R. O. cows.
Many daughters of 36 pound bull.
Many daughters of 32 pound bull.
Many daughters of a bull who has 43 A. R. O. daughters.
Numerous daughters of two 30 pound sons of King Segis Pontiac.
Numerous daughters of a grandson of Aralia De Kol.
Nearly all females of breeding age are in calf, to a full brother of King Segis Pontiac Count, whose two nearest dams average 1146 pounds butter one year, or a son of King Segis Pontiac, and the 30 pound cow, Pear Ormsby Burke.

Blood lines of this entire sale are close to the greatest record cows and bulls of the breed. Cattle of this section are notably free from tuberculosis. and are tuberculin tested, by State Authorities.

As a special inducement, individuals whose purchases exceed 15 head will have freight paid to destination of purchaser.

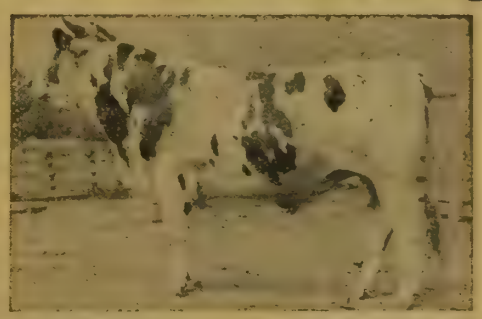
Good Holstein Bulls

Sons of a Great Sire From High Record Dams

They are by SEGIS PONTIAC DE KOL BURKE, son of the great RIVERSIDE SADIE DE KOL BURKE, 134 pounds milk in one day, 28,826 pounds milk, 1085 pounds butter in one year, 2065 pounds butter in two years. His first five daughters tested average 753 pounds butter, 17,358 pounds milk as two year olds.

No. 1. Dam's record, 762.37 pounds butter, 18,424 pounds milk in one year, 24.37 pounds butter seven days. She has a full sister with 843 pounds, and her dam, 23.74 pounds in seven days, at eleven years three months old, has five A.R.O. daughters. Her sire is IGNARO DE KOL with ten daughters that average 883.60 pounds butter and 21,815 pounds milk, including Aralia De Kol, 1142 pounds and Ignaro Creamcup, 1077 pounds. He is more white than black, excellent type and ten months old.



No. 2. Dam now completing test over 800 pounds butter as four year old. Butter seven days 26.30. She is just one of the nicest cows you ever looked at, a real show animal, straight, deep bodied, light colored, carries a faultless udder and milked over 90 pounds with second calf. This bull is light in color and his type is beyond criticism. Eleven months old.

If you are considering the purchase of a herd sire and appreciate heavy long distance production combined with the most desirable type, you will take our advice and buy one of these. Remember that under official supervision the dam and sire's dam of these two bulls average over 900 pounds butter and 28 and 29 pounds in seven days. Your choice for $300.00.

A. W. Morris & Sons Corporation
Woodland, Cal.

The Proof of the Pudding

KING KORNDYKE PONTIAC 20TH as a calf looked like the real bull to head our herd, adding to his great individuality the backing of a pedigree with an unbroken line of great producing dams and type of the highest character. The price of $6500.00 which we paid for him was really a minor consideration. Now that his calves are coming on we know that we made a fortunate choice, for they are certainly beauties. His oldest son in our herd was sold at 40 days of age to become the future head of a newly established Stanislaus County herd.

And the last six calves by King have all been heifers, mostly white in color, beautiful individuals, and every one of them has large well-placed teats, just what we expect from the great uddered cows in his ancestry.

Better get in touch with us for one of his young sons for YOUR herd. We already have requests for reservations of unborn calves if they are bulls. Satisfaction of the buyer is our first consideration, and our prices are reasonable.

Our Entire Herd is Tuberculin Tested

When writing advertisers, mention The Cultivator.

Pontiac Segis who likewise was killed, but who has a fine list of daughters and several sons to carry on.

In the Morris herd the blood of Aralia De Kol appears to have nicked particularly well with that of the Mead and Juliana famalies. Her oldest daughter, Aralia De Kol 3d is by Juliana King of Riverside, who is out of the former world's record two year old, Juliana De Kol, who is by Ignaro De Kol, sire of Aralia De Kol. Aralia De Kol 3d has the following records to her credit:

At two years three months:
Milk seven days..... 457.60
Butter 17.63
In seven days eight months after calving:
Milk 325.30
Butter 16.54
Milk 365 days 17,509.50
Butter 772.93
At three years six months:
Milk seven days 501.80
Butter 23.08
At six years:
Milk seven days 646.20
Butter 28.75
Milk 30 days 2,399.70
Butter 109.65
Milk 365 days 24,554.10
Butter 1,100.47

It will be noted that like her dam she made no sensational spurts in production, but has kept right on delivering the goods throughout the year. In her two year old form her eight months after calving butter record won second association money and her yearly butter record fourth prize. She is also a show type of high excellence.

The next daughter of Aralia De Kol is Aralia De Kol Mead, who is by King Mead of Riverside, son of Juliana King of Riverside and De Kol of Valley Mead. Aralia De Kol Mead has the following records to her credit:

At two years seven months:
Milk seven days 450.10
Butter 21.70
Milk 30 days 1,875.80
Butter 89.25
Milk 365 days 16,669.30
Butter 870.61
At three years ten months:
Milk seven days 491.60
Butter 26.16
At five years:
Milk seven days 536.60
Butter 27.27
Eight months after calving:
Milk seven days 408.10
Butter 25.57
Milk 365 days.....23,044.60
(Strictly official)
Butter 1,215.20
(Strictly official)

Here again we find no sensational short time records, yet one of the greatest yearly records of the breed, while only a few cows have exceeded her two year butter production of 2085.81 pounds. It is particularly interesting to note the very narrow margin between her original seven days butter record and her eight months after calving record during the year of her strictly official test.

The third daughter of Aralia De Kol is Aralia De Kol of Riverside, who made 14,552.60 pounds milk and 697.03 pounds butter in one year as a four year old and at the next freshening has made 562.00 pounds milk and 24.98 pounds butter in seven days.

Through her sons Aralia De Kol has some splendid granddaughters, the daughters of Aralia King being the only ones to have reached mature age as yet. Of his daughters, Margaret Aralia De Kol recently completed a yearly record that adds to an outsanding family combination. Her records to date are as follows:

At two years seven months:
Milk seven days 365.50
Butter 17.32
Milk 365 days 14,335.00
Butter 723.02
At four years:
Milk seven days 517.80
Butter 26.91

At five years—No increase in seven day records.

Eight months after calving:
Milk seven days 397.80
Butter 25.85
Milk 365 days 22,922.70
Butter 1,161.87

Again no sensational short time records, but delivery of the goods on the yearly work.

Granddaughters of Aralia De Kol through her daughters are in milk only from Aralia De Kol Mead. Her oldest daughter, Aralia De Kol Pon-

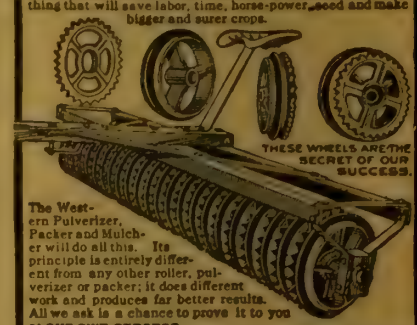
Retained After-birth

Cows can be made to clean easily without using force.

When cows do not clean properly after calving, it indicates a germ infection which is likely to run through the entire herd and result in Abortion and Barrenness.

The after-birth should be removed at once without force by means of the B-K douche and the cow treated to prevent her becoming an aborter or sterile. Authorities state that while there is no absolute cure for abortion and sterility, nevertheless the infection can be controlled by prompt treatment and the animal saved for successful breeding.

B-K is scientifically correct for this work. Used as a douche for the uterus, it quickly brings the after-birth, dissolves the slimy albuminous matter, kills the germs, stops discharges and controls the infection. B-K does not cause straining, but is soothing and heals the tissues.



Send for "evidence" and free Bulletin No. 52 "Contagious Abortion." If your dealer does not have B-K send us his name.

tiac Mead, sired by Segis Pontiac De Kol Burke, son of Riverside Sadie De Kol Burke, is now milking with her second calf and has the following records to her credit:

At two years seven months:
Milk seven days 475.90
Butter 23.29
Eight months after calving:
Milk seven days 370.10
Butter 15.51
Milk 365 days 18,362.50
Butter 932.43
At three years nine months:
Milk seven days 511.80
Butter 34.41
Milk 30 days 2,194.40
Butter 138.09

In her production we find some really creditable short time records with a beginning of yearly records that promises to add much to the fame of this family. Her eight months after calving butter records and her yearly butter record each won first prize money last year, milk record third prize, while her seven days butter record in three year old form won fourth prize and her 30 day butter record third prize. She is distinguished as the dam of the first bull in the world whose seven nearest dams average over 1000 pounds butter in one year, he being at present in service in the Morris herd where a number of top females have already been bred to him.

Aralia De Kol Mead also has a pair of twin daughters now milking in the Morris herd. Of these Aralia De Kol Mead 2nd made 481.8 pounds milk and 21.61 pounds butter in seven days at two years four months and is now making a splendid yearly record. The other twin, Aralia De Kol Mead 3d, came in with two blind quarters but made nearly 16 pounds butter in seven days from half an udder, freshening as a junior two year old.

Grandsons of Aralia De Kol are being given promising opportunity in a number of leading western herds. Of these Sir Aaggie De Kol Acme, by Aralia De Kol Pontiac Segis and out of Aaggie Acme of Riverside 2nd, is owned jointly by the Morris Company and Fred W. Kiesel, Sacramento. In these two herds he is being given very heavy service and has a beautiful and most promising lot of young daughters coming on.

Segis Pontiac De Kol Mead, out of Aralia De Kol Mead and sired by Segis Pontiac De Kol Burke, thus making him full brother to Aralia De Kol Pontiac Mead, is owned jointly by J. H. Hulbert, Mount Vernon, Washington, and Ed Hoem, Snohomish, Washington.

Sir Aaggie De Kol Acme 2nd, son of Sir Aaggie De Kol Acme and Aralia De Kol 3d, heads the excellent herd owned by Alex Whaley, Tulare. This bull has an average of 1115 pounds butter in one year for five of his seven nearest dams, an average equalled by only one other service bull in the world. He is a splendid individual besides being one of the very best bred bulls in service today.

Another young bull of marked excellence in this family is King Aralia Mead, son of King Mead of Riverside and Margaret Aralia De Kol. He is in service in Westlawn Herd of registered Holsteins owned by H. E. Vogel, Fresno, and combines in a wonderful manner the blood of the Mead, Juliana, and Aralia families, the combination that has proved so successful in the Morris herd.

Thus, upon the blood of Aralia De Kol is being built one of the most remarkable groups of producing Holsteins within the breed. To summarize a few of the outstanding features uncovered in the observation of Aralia De Kol we find:

That her sire, Ignaro De Kol, is the only bull in the world with nine daughters above 20,000 pounds of milk in one year, the nine averaging 22,305.1, pounds and his entire list of 14 yearly record daughters averaging 20,543.4 pounds milk in one year. Ten of his daughters average 883.59 pounds butter in one year.

That Aralia De Kol, with two daughters and four granddaughters, has won $409.75 in the association prize lists, besides having been debarred many times under the rule which prohibits a breeder from winning more than three prizes in any one division.

That Aralia De Kol, two daughters and a granddaughter are the only instance in the breed where an 1100 pound cow had two 1100 pound daughters, an 1100 pound granddaughter and a 932 pound granddaughter.

That Aralia De Kol, one daughter and a granddaughter are the only instance in the world where each of the three has an 1100 pound butter record and a record of 25 pounds butter in seven days eight months after calving.

That Aralia De Kol, her three daughters and two granddaughters average 21,921 pounds milk and 1041.55 pounds butter in one year, with an average butter fat test of 3.8 per cent, and this average includes one two year old record. No other family of equal number can nearly approach these averages in any respect.

GREAT SALE OF PURE BREDS

Messrs. Sanders and Bradshaw, owners of 175 pure bred Holsteins, are announcing their sale at the state fair grounds, Phoenix, Arizona, Wednesday and Thursday, February 5 and 6. There are 140 females and 35 bulls. Amongst the bulls is King Lilith Pontiac Segis, Bradshaw herd sire. Full brother to King Segis Pontiac Count whose two nearest dams average 1146 pounds butter one year. Greatest sire of world's record daughters. Nearly all of Bradshaw consignment in calf to above bull.

Another is King Pearl Segis Pontiac. Two nearest dams average 33.88 butter seven days. Half brother to the $50,000 and $35,000 bulls. Many cows and heifers in calf to this bull in sale.

Many other bulls of great merit in breeding and individuality, who are sons of 36, 32 and 30 pound bulls and from A. R. O. cows of excellent records.

Frank R. Sanders, Mesa, is manager of the sale. The auctioneers are R. E. Heager of Illinois and C. O. McMurtry of Arizona. The gathering of such a large number of pure breds means great opportunities for the great Southwest.

In addition to the pure breds there will be offered 100 grade cows and heifers. These, however, on the day following the sale of pure breds.

The acreage of olives in the Salt River Valley is now about 1000.

CALIVADA
Sheep MANURES Steer
From highest nitrogenous feed. Decomposed and concentrated by age in their own liquids, containing the highest percentages of Nitrogen, Phosphoric Acid, Soluble Potash, and readily available Humus.
Shipped commercial dry. Cars average 22 to 24 tons. Saves four-fifths labor in application. Thousands of tons now being shipped to citrus and deciduous growers in California.
Write for samples, prices and particulars today to insure prompt deliveries.

BERKSHIRE SALE AT UNIVERSITY FARM

W. N. Carruthers, president of the Western Berkshire Congress, has announced that the annual congress and sale will be held at the University Farm, Davis, Wednesday and Thursday, February 19 and 20.

A meeting of the board of directors has been called for January 18, and plans for the event will be discussed.

The annual meeting and election of officers will be held Wednesday afternoon and will be followed by a dinner in the evening.

The entries will be judged Thursday morning and the champion sow will be selected.

One of the features of the meeting will be the barrow contest. Much interest is being manifested in this contest and the prizes offered are such that, it is expected, will attract practically all the barrows that were entered for the San Francisco show.

The sale will consist of 50 head, and will include bred sows, few open gilts and a limited number of boars.

The idea back of these congress sales is to furnish an opportunity for young breeders and beginners to select the highest class of breeding stock. Every animal listed is vouched for by the Western Berkshire Congress.

Catalogs for the event will be available to those who file their applications with W. M. Carruthers whose address is Live Oak.

Horse Out of Condition

I have a horse that I purchased about two months ago and he seemed to be out of condition from the start. His bowels rumble and he has catarrh. When he is worked he tires very quickly. What remedies would you advise for him?—Subscriber, Downey.

Probably the result of influenza and overfeed. Have your druggist prepare these remedies: One ounce of aloin, three ounces of turpentine and one quart of raw linseed oil. Mix and shake well. Divide into three doses and give one dose every day. Also get four ounces of nitrate of potash, four ounces of ground gentian, two ounces of powdered nux vomica, two ounces of the sulphate of iron and enough farina to make one pound. Mix and divide into 16 powders. Give one in the feed every night.

Skin Disease

I have a young horse that has some kind of skin disease. During the summer we noticed lumps under the skin about the neck, shoulders and body about an half inch across and some swellings under the belly. There seems to be a lot of dandruff in the hair. We treated it with kreso solution and an ointment made of vaseline and kreso and thought we had it cured but now it has broken out worse than ever. White hairs have appeared on some of the spots about the head that have healed. Will the white hairs turn black again and what can we do to remedy the trouble?—Subscriber, Lincoln.

This is a form of skin disease that is usually accompanied by stomach disorders. Where white hairs appear now they will always remain. Get the following powders and ask your druggist to prepare them carefully. Arsenic, one dram; powdered nux vomica, two ounces and powdered gentian, four ounces. Mix and divide into 24 powders. Give one powder every night in a little feed that has been slightly dampened with water. Also the horse should be clipped all over and thoroughly groomed twice a day. Do not feed too rich feed and give some carrots if you can get them.

Cough

I have a horse that had an occasional hard cough for several months and now a nasal discharge has developed. At first I thought barley beards were causing it but on examination found none. Please prescribe through the Cultivator.—Subscriber, Ramona.

Probably catarrh following a cold. Get these powders of your druggist: Chlorate of potash, two ounces; powdered belladonna leaves, one ounce; sulphate of iron, one ounce and powdered gentian, four ounces. Mix and make into 16 powders. Give in the feed every night.

Sore Neck

I have a horse that has an ulcerous sore on the neck where the collar works. By using healing powder I can keep it smooth when working and when idle a short time it seemed to heal over only to become raw and mattery again as soon as worked. What can I do for it?—Subscriber, Ramona.

A sore on the top of the neck where the collar comes is hard to heal. Try this: Sugar of lead, two ounces; dilute acetic acid, one pint and 20 drops of sulphuric acid. Mix in the order given. Once a day after working wash the neck with cold water and dry the parts, then shake the bottle of lotion to stir up the powder that settles and apply enough to soak the sore spot. Or if you can get some oak bark, the part next to the wood, make a strong decoction of it and use that in place of the above.

Sweeney

I would like very much to have a sweeney remedy published again that

was published in the Cultivator several years ago. My father used it with grand success on two different occasions and we are needing it now to treat a valuable mule but we have lost it.—Subscriber, Porterville.

Sweeney is the result of strained muscles of the shoulder. It may be caused by a slip forward or back or by a sudden jerk of the shoulder when the hub of a wagon strikes a solid object or a plow strikes a stone. At first the muscles swell but are usually not noticed. If the muscles were properly treated at that time they would not shrink below normal and would regain their full strength, but when neglected they will shrink away and become very weak. The proper treatment in the first stages would be plenty of hard rubbing with a good liniment. This liniment would be good for such cases. Equal parts of turpentine, spirits of camphor, tincture of capsicum, ammonia, alcohol and olive oil. Shake well and rub in once or twice a day.

A method commonly used to restore shrunken muscles is to run a tape under the skin the whole length of the muscle. Cut a hole in the skin at each end of the muscle and with a long, flat needle draw the tape through and leave it there. Tie a large knot at each end so it will stay. Soak the tape with equal parts of turpentine and castor oil and leave it until the muscle is up to normal size, then remove it and wash out the wound with a good antiseptic. It will soon heal.

A method I use and recommend is to inject the shrunken muscle with an hypodermic syringe in several places, using equal parts of turpentine and alcohol and using 15 or 20 drops of the mixture in each place. This is a good treatment for sweeney in any stage of the trouble. It is a little severe but will do no harm. It may have to be repeated in two or three weeks. The patient should be rested most of the time until fully recovered.

The reason for giving the several remedies is because you may not be able to follow one and then you may adopt the other. With the two latter methods you should employ a veterinarian as you would not have the instruments to do the work properly.

Pigs Dying

I have fifty pigs weighing from 50 to 60 pounds each and 17 of the number are Durocs. The Durocs are the only ones affected so far. They take spells of slobbering at the mouth, going around in a circle and sometimes falling over on their back, when it is hard for them to get up again. They linger for two or three weeks and die. I would like to know what the trouble is and what to do for it.—Subscriber, Bloomfield.

The symptoms are somewhat out of the ordinary. Open the next one that dies and see if there are any worms in the stomach or bowels. And see if the bowels are inflamed. If you find any worms then get some powdered areca nut and give each one a teaspoon in a cup of milk. Maybe he will eat it as there is no taste to it, but if he will not then turn him on his back, hold his mouth open with a stick and pour it down him. If there are no worms would suggest a dose of castor oil; three or four tablespoons for each one. By all means see what you can find inside those that die, and if this does not help you write again when you find out more about it. The fact that only the Durocs have the trouble is probably accidental.

GINGER SNAPS

"What is your doggie's name?"
"Ginger."
"Does he bite?"
"No, sir. Ginger snaps!"—Judge.

Soil Analysis: Its Relation to Plant Nutrition

By R. R. Snowden

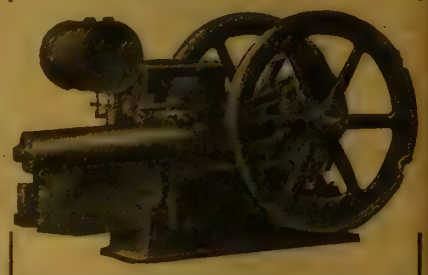
IT IS generally understood that a soil destitute of any one of the accredited plant-food elements: oxygen, hydrogen, nitrogen, potassium, calcium, magnesium, phosphorus, sulphur and iron, is essentially barren. It is therefore evident that each of these—and carbon which is derived directly from the air—is just as necessary and important as any other element in the economy of plant life.

The mineral elements and nitrogen may exist in the soil in one or more of three states as regards their availability for plant use, as follows: that which is soluble in water and may be used immediately by plants without further change; that which is not thus soluble and usable, but may be made so by suitable agencies in the soil to replenish the first class as it is removed from the soil; and a third which is not readily made available and therefore cannot be counted upon to influence crop production in any appreciable degree.

The first mentioned category of plant foods is that which determines and controls the immediate productive capacity of a soil, while the third constitutes those much larger stores held in trust for the use of future generations, providing a kind of insurance against the rapacity of the present.

These distinctions furnish a basis for three separate kinds of soil analysis, and as a matter of fact, the analysis most suitable for one class or state of plant foods is entirely valueless for another. And yet it is not infrequently the case that the permanent fertility analysis is used for determining immediate crop production needs, and although foredoomed to failure, upon these false results soil analysis is condemned. That acknowledged benefactor of world wide agriculture, the late E. W. Hilgard,—without the mention of whose name and work a book on agricultural chemistry can scarcely be written in any language,—speaking in this connection of his "results in many respects so definite that he has ever since continued it" says: "This was done in the face of almost uniform discouragement from agricultural chemists until within the last two decades; with occasional severe criticism of this work as a waste of time and of public funds." Fortunately Doctor Hilgard lived to see the beginning of recognition of the value of soil analysis when rightly directed and interpreted.

All discussions of the usefulness of soil analysis hinge upon the methods of analysis; and this is where the writer is inclined to arraign the use of the official method for determining the fertilizer needs of soils. This method, which is used by all the agricultural experiment stations throughout the country,—however admirably adapted for permanant fertility investigations, is utterly useless for determining the current crop needs of the soil, since the soil solution made as it directs cannot even approximately represent the nutrient medium of the soil in which the plants feed. This solution is made by digesting the soil at 212 degrees Fahrenheit in strong hydrochloric acid for ten hours. Analytical data obtained by such method furnishes no adequate basis for determining the fertilizer needs of a soil.



Many methods have been proposed for extracting the soil so that the analysis of the solution obtained would furnish an accurate appraisment of the several plant-food elements subject to immediate use by the plants. Each was proposed with a laudable desire to contribute to the general store of knowledge for the common good, and therefore entitled to at least a respectful hearing; yet each must "run the gauntlet" of unprejudiced investigation, for every true scientist expects a critical examination of his ideas, and even their rejection if found unsound.

The most recent attempts made along this line have been to obtain the soil moisture itself without the addition of any solvent whatever. With this object in view the soil has been subjected to the action of a powerful centrifuge machine whereby its capillary water, clinging by cohesion to the surface of the soil grains is forced to pass out of the soil mass and is collected for analysis. This method seems to the writer open to the objection that the water passing under such stress through the soil mass inevitably becomes charged with the soil nutrients in greater measure than it originally contained. This view appears supported by the fact that the solution thus obtained is practically the same in composition and concentration from all soils, whether rich or poor.

The latest method proposed for making the soil extract with the above object in view is to subject the soil to a pressure of something like 150 tons to the square inch, by which the soil solution is actually squeezed out of the soil. This method is open to the same criticism as the preceding and with still greater emphasis, for by this procedure the soil grains must all be crushed to impalpable powder, in which condition they should reasonably be expected to surrender all the more readily their substance to the solvent action of the water. The analysis of the soil extract thus obtained therefore can furnish no accurate knowledge of the actual nutrient medium in which the plants feed, and any forecast of the fertilizer needs of the soil based upon it must be misleading.

After all that may be said, the only test worth considering is the agreement between the actual crop performance and the analytical indications. By this test the writer has proved to his own satisfaction in the practical results obtained that the best solvent for the soil analysis is one of the following three for the several soil constituents: a weak solution of hydrochloric acid, a saturated solution of carbonic acid—the actual acid of the normal soil, and distilled water. And the analysis of the solution made

with the proper one of these solvents does furnish the necessary data for correct diagnosis of the immediate soil needs.

Failure to get results from soil analysis may be due to any one of a number of causes besides that indicated above, for "a chain is no stronger than its weakest link."

It is therefore that the agricultural chemist is concerned with much more than simply determining the plant-food deficiencies of the soil; though this of the first importance. He must seek the detection and counteraction of injurious soil elements; the mellowing and softening of tough clays; destruction of hard-pans, etc.; the prevention or correction of acidity; the promotion and maintenance of the highest state of capillary efficiency; the conservation of organic matter in the soil. He must encourage to the utmost the activities of the beneficial bacteria and prevent loss of their products from the soil. For instance, he must provide for the fixation of ammonia when it is produced by one species of bacterium from the organic nitrogen of the soil or manure. Neglect of this latter duty may be, and sometimes is followed by lack of new growth, and other evidences of nitrogen-starvation in the trees or plants in spite of generous stores of nitrogen in the soil; for the ammonia if not "fixed" passes into the air as a gas and is lost to the soil it should fertilize. He must secure and maintain conditions favoring the development of the root-hairs, for these are the principal mouths of the plants through which the contributions of the soil to the living plants are absorbed. The importance of this is seen in the fact that under the most favorable conditions the aggregate root-hair surface, and consequently the approximate feeding capacity of the plant, may be multiplied, it is estimated, as much as 50 times; and the resulting increased ability of the plant or tree to draw nourishment from the soil becomes an important factor in crop production.

It is thus manifest that the agricultural chemist must be not only an efficient chemist, but a practical and scientific farmer as well; for he must have a more or less intimate knowledge of these various needs of the soil and of the means whereby to attain them.

In view of all these facts it is no wonder that soil analysis fails to bring expected results in the hands of some.

SMILO GRASS

One of California's greatest needs is a pasture grass which will spread over our hillsides and endure during the season of drouth. A grass is now reported from San Diego which offers many of the advantages which have been so long desired. It is sometimes called Many Flowering Millet. Regarding it we have from a subscriber in San Diego County:

"A package of seed of Smilo Grass was received from the University of California as early as 1885 by the former owner of Oakdale Ranch, Spring Valley, Mr. Steele.

"He planted it under some cottonwood trees back of his house and gave it no further thought. It grew, but the rabbits kept it from seeding and spreading.

"When the ranch was fenced in 1909 the grass soon made itself evident, so much so that G. D. Steele, the present owner, in 1914 applied to the university through the farm adviser to ascertain its name and value."

The botanical name of this grass is oryzopsis miliacea. Other names which have been given to it are Many Flowering Millet (as noted above), and San Diego Grass, but the more general term used is Smilo Grass. The same subscriber also sends us these notes as to its culture:

Fall is the time to plant Smilo Grass seed for forage on lands which cannot be irrigated. Roots may be set at any time if watered, otherwise set before last spring rains.

As Smilo is similar to grain the way it roots, it is easily killed by cultivating, consequently cannot become a pest.

Smilo can be grown where alfalfa cannot, and even where it is impossible to grow ordinary cultivated crops.

Smilo is a valuable grass to plant along fences or in any spare corner or plot. When once rooted it smothers out weeds and makes a valuable forage grass when all other grasses are dried up. It is particularly valuable in milch goat pastures.

The seed of Smilo Grass came from Southern Europe where it is said to be a wonderful forage grass. Being a perennial bunch grass, it is planted 12 to 14 inches apart each way, and in a few years becomes nearly a solid mat.

Now's the Time

to get in your dormant or winter spraying. If done properly—this will prevent the accumulation of certain insect and fungus enemies; will clean your trees and soften the bark; and will keep the trees in better health, vigor and fruitfulness. For this purpose there is nothing so effective as

LAWRENCE AUTO POWER CO.

"Not Magic—Dynamite."

"I *blasted* the holes for my young trees instead of digging 'em by hand. That's the reason that I am all through planting before you're fairly started. Now I shall have time to do a lot more work around my place while you are breaking your back over those spade-dug holes."

"Magic?"

"Sure,—if you want to call it that. It's the 'Yellow Magic' that's packed inside of those little sticks marked

HERCULES DYNAMITE

"And I'll tell you something else, too. Trees that are planted in blasted holes grow better and bear sooner than the ones planted in the old fashioned way. The shock of the explosion loosens the earth all around the hole so that, when the young tree begins to take hold, its roots have a chance to spread and grow."

"When I first started to use dynamite I didn't believe that it *could* make such difference—but I've learned by experience. The trees that I planted last Spring look like two-year-olds today."

"Better send to the Hercules Powder Co. for a copy of their 68 page, illustrated book, 'Progressive Cultivation.' It will tell you how to make more money and save time and backache by using dynamite in your orchard."

HERCULES POWDER CO.

Injunction Against Trespassing

How do you start and what is the cost of an injunction to restrain cattle from trespassing? The justice of the peace claims he has not power to stop the trespassing.—Subscriber, Lancaster.

An action to obtain an injunction is one for an equitable remedy of which the superior court has original jurisdiction. The justice of the peace has jurisdiction of the action for damages for trespass of animals under the estray act, providing it be less than $300. As the injunction remedy is one which requires the knowledge of a lawyer to successfully institute and prosecute you should consult your attorney with respect to the above question.

Faulty Note

My sister gave a note due in six months. Both parties, unused to legal terms, inserted the words "with grace" intending to mean "with interest." If sister asks the noteholder for time and is refused what can be done and how much time extension can she get? —Subscriber.

The words "with grace" have generally been understood to mean a period of three days after the date of maturity within which payment might be made. As between the maker and payee it, therefore, is of comparatively little importance; with respect to the liability of an endorser of the note, if such there be it would be of importance with respect to the date of presentment for payment and notice of dishonor. Days of grace, however, have long been abolished in this state, although it is possible that where particularly mentioned in the note the three days might be given. In a suit at law upon the note in this cases the holder could not obtain interest, but would require the aid of equity to reform the note under proof of the mutual mistake.

Willing Partnership Property

Father and son are partners; each wishes the other to have his estate in case of death and survival of the other. In case of no will what would be done? If estate would go to the probate court, explain the how and why of this proceeding. — Subscriber, Lamanda Park.

If there is no will, the wishes of the parties would probably be frustrated. The laws of all states provide how the estates of intestates shall be divided, embracing every possible contingency. It is necessary for the proper transmission of property, payment of debts of deceased persons, and securing the claims of all interested that a tribunal shall determine who the creditors are and in what amount and who the heirs are and to what they are entitled. In case of no will, the procedure is commenced by the appointment of an administrator, relatives are preferred, the closer relatives having the higher preference, except that a surviving partner must in no case be appointed; notice is then given to present claims to the administrator, who in conjunction with the court approves or rejects them; if rejected suit may be brought against the administrator to establish the claim. When claims are paid the estate must be distributed to those heirs that the law declares to be entitled to it.

Partnership

Father and son, business partners, sell real estate on installment contract. The title to this real estate stands some in the name of the one, some in the name of the other. The firm does a regular real estate brokerage business. Could the survivor carry out the contracts? Could either give the other a power of attorney, good after death?—Subscriber.

The interest of the decedent in the partnership business being an asset of the estate of the deceased would be included in the inventory of the estate. The contract purchasers knowing only the firm would have their claim against the estate of the deceased, as well as the survivor to enforce the performance of their contracts or damages for breach. It is the right and duty of the surviving partner to continue in possession of the business, but he must settle up its business without delay and account and pay to the administrator, from time to time, such balances as may be payable. Thus on lands belonging to the survivor, the profit on the sale made would have to be determined and the interest of the deceased partner therein paid to the estate.

All powers of attorney or other agencies are revoked by the death of the principal as the agent derives his power to act solely from the principal and when the principal ceases to exist the power ceases and at the moment of demise.

UTILIZATION OF THE MOJAVE

The California state department of engineering has issued Bulletin No. 5, "Report on the Utilization of the Mojave River for Irrigation in Victor Valley". It is a 94 page report with complete maps and is most valuable to Victor Valley people and to all interested in Mojave desert conditions. The report may be had by writing State Department of Engineering, Sacramento, or Division of Irrigation Investigations, U. S. Department of Agriculture, 601 Federal Building, Los Angeles.

Fundamentals of Poultry Culture

Written for California Cultivator By Jean A. Koethen

IT USED to be just "keeping chickens," now it is poultry husbandry. The farmyard flock of 25 or 30 years ago was not expected to pay any particular profit. It picked up the grain left by the horses and cows, and laid eggs in the spring. Today we are expecting something of the farm flock. With the cheap feed the farmer is able to command, chickens can be made one of the most profitable of all farm crops. If they are unprofitable and unproductive the fault rests on the shoulders of the farmer himself.

At the beginning of what promises to be the best year poultry men have seen for nearly a decade, it is well for everyone who contemplates raising a flock, whether large or small, to sit down and think out his aim for the year. Is the flock to be improved? If so, how can improvement be managed most readily? Have the hens you already have been satisfactory layers? Then how can their virtues be reproduced or accentuated in the next generation?

The first rule of poultry husbandry ought to be "Quality first." There is nothing gained by raising a lot of culls. Even for the family table they cost more than they are worth. Neither is there any profit in raising more chickens than you have comfortable room for. The backlotter is wise to limit himself to a dozen hens or less, unless he keeps one of the small, active Mediterranean breeds which stand close confinement well. The farmer was never in a better position to increase his flock than now. He has the feed; he has the range. With a poultry house from 16 to 20 feet square and a run half the size of a city lot, he can keep 100 hens almost as easily as he could keep 25 without proper accommodations.

But it is not sufficient that the hens be merely hens. They must be layers as well. Real bred-to-lay hens the past year, in spite of high-priced feed, have netted their owners a profit of two to three dollars each. At some of the laying contests the value of eggs produced by a single hen has been as high as $8.00. Why, the income from a 100 hens of the right sort, on the farm, would be "velvet." But they must be the right sort.

Now in January, with the hatching season close upon us, is the time to take stock, decide which hens are worth keeping and which are not, and whether or not the better hens have been layers worthy to reproduce their kind. If an egg record has been kept, or the slackers have been culled out early in the winter by one of the many methods recommended, the breeding hens have already been selected. If the purpose of improvement is the result of a New Year's resolution, or as more often happens of a visit to the poultry show, culling will not be so easy. If any of the hens are satisfactory in both utility and standard qualities, the best plan is to confine these few with a good male and breed from them and from them only. The rest of the flock can then be culled as occasion comes. During February, March and April most hens will be laying. Any that are not should certainly be gotten rid of without further trial.

I used the word in the plural at the head of this column, but the more I think of it, the more I am inclined to believe there is just one fundamental thing in poultry culture, at least so far as it applies to chickens, and that is breeding. Stock must have the right start, must have in itself the constitutional vigor which will enable it to live in spite of external conditions, must have the congenital, inbred disposition to lay, if it is a female, to pass on fecundity to its offspring, if it is a male, or it is worth very little. The foundation of every prolific, profitable flock is proper selection and mating.

If you find you have two or three hens that are vigorous enough and prolific enough and near enough to standard requirements in color and shape for breeders, your breeding pen is half provided for. The other half is the male. Indeed he may easily be more than half. Color, size, prolificacy, vigor, may all be spoiled by the use of the wrong male.

It is often safer to buy eggs from a breeder who understands mating than to risk mismating your own hens to a male with whose qualities theirs do not "nick." If you have a special reason for using your own hens, then find some expert who will select the right mate for those hens. Many judges are willing to undertake this delicate task, as far as exhibition type is concerned, but let us never forget for a moment that what we are most concerned about is eggs. We want standard color and type and weight, but we also want egg type and egg records.

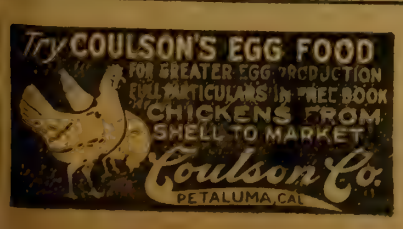
It has always been possible to secure eggs and cockerels from Leghorns with egg records, but until now bred-to-lay stock that was also standard bred has been difficult to find in the heavier breeds. Now breeders begin to realize that the public demands eggs as well as feathers and are combining the two. This is the most delicate of all breeding problems and is solved only by the most rigid selection, using as breeders only hens that have made a certain record and leaving out every bird that is not up to the standard in other respects. So far R. I. Red breeders seem to be ahead of other breeders of heavy hens in that several now advertise egg-type hens. At the winter shows I talked with two breeders whose Reds have made very high records, E. A. Weaver of Los Angeles, whose birds are known as "Weaver's Reds," and Lester Payne of San Bernardino, who is breeding not only for eggs and type, but for the five-year hen. A pen of six of Mr. Weaver's hens averaged 208 eggs in 1916; 1917, 64 hens averaged 206 eggs; and in 1918, 36 hens averaged over 203 eggs. One of Mr. Payne's hens laid 272 eggs her first year, 261 eggs the second year and 258 eggs the third year. One of her daughters laid 283 eggs in her first year, and a granddaughter 201 eggs in 207 days. This hen, "Champion Red Angeles," won two special cups at Los Angeles shows, and her sister was first hen at the mid-winter show. These figures simply show that bred-to-lay and exhibition quality are by no means incompatible, and give the beginner something definite to aim at.

Let us keep distinctly in mind in beginning poultry operations for the year that there is no best breed. Our breed is what we make it. Doubtless there are many breeders of other breeds who are doing the same work for their breeds that Mr. Weaver and Mr. Payne are doing for R. I. Reds. It is possible, by right selection, and mating to build up a heavy laying strain out of indifferent material. Mating a well-bred male to just ordinary hens, and the best pullets of the next generation back to their sire is a good way of improving the strain you have, provided the breeding of the male is right. The son of a heavy layer mated to hens that are themselves good layers can hardly fail to produce better layers. If the male is not the son of a heavy layer his daughters will in all probability be less prolific than their mothers.

Shippers of eggs are asked to load cars to capacity. The minimum is placed at 24,000 pounds.

We Guarantee More Eggs

A good layer will transform one dollar's worth of food and supplies into $3 worth of eggs at present prices. To be a good layer a hen must be in top notch of health. That is GERMOZONE'S strong hold.



Germozone, three times a week, coupled with our simple directions for daily feeding, care and culling out slackers, is guaranteed to produce better and more permanent health and egg supply, or no pay.

One woman averaged 18 eggs daily from 21 hens in December. Germozone costs less than one cent per hen per month. See the profit.

Germozone cuts out the illnesses from musty or spoiled food, impurities picked up with food from floor, contagion through the drink, roup, colds, canker, throat inflammation, sour crop, etc. It goes well with any modern method of feeding—grain, vegetables, meat.

SIXTY DAYS' TRIAL—PAY IF SATISFIED. To those who agree to use as directed and pay if satisfied, we will send GERMOZONE first time on 60 days' trial, postpaid, without preliminary charge. Write today, stating how many hens you have. Germozone is sold by drug and seed stores in 75c and $1.50 sizes.

GEO. H. LEE CO., Dept. 418 Omaha, Neb.

You Wouldn't Expect the Factory
to produce a finished product without the proper raw material.

Why Should You Expect the Hen
to produce Eggs without the necessary raw material for their manufacture?

The Hen Is Merely an Egg Factory.
She converts the raw material—given her in the way of food—into the finished product—the EGG.

Thousands of Dollars Are Thrown Away
every year, on account of feeding hens rich egg mashes and grains which produce more yolks than whites. The hen not having the ALBUMEN to produce the white of the egg, naturally can not make the egg; therefore the surplus yolks are absorbed into the system, causing the hen to become too fat and a decrease in her egg production.

Lactein Contains the Needed Albumen
to produce the white of the egg. It contains Lactic Acid which helps to assimilate and digest the food and keeps the bowels in a healthy condition. It also contains a Germicide which kills the worms and all intestinal germ life.

Lactein Is Not a Cure-All,
but it prevents nearly all diseases known among poultry, by keeping them so strong, healthy and vigorous that their system resists the disease germs.

Lactein Saves the Baby Chicks.
It prevents the dreaded white diarrhoea and will cut your heaviest losses 90 per cent. Chicks fed Lactein will show a much more rapid growth in weight, than those given the same food without Lactein; this has been proven many times. Hundreds of poultrymen find Lactein superior to either sour milk or buttermilk for chickens, besides being cheaper and more convenient to feed. Lactein is just as valuable for the entire feathered family: turkeys, geese, ducks and pigeons.

Feed Lactein to Hogs.
Lactein is equally valuable as a food and tonic for hogs. It stands to reason if sour milk or buttermilk is a good appetizer and tonic, Lactein is even better, because it is perfectly pasteurized and the acidity is always the same. Feed it to your hogs in their swill water or other feed and watch them grow. A few extra pounds of pork these days make a big difference in profits.

If feeders who have as many as 5,000 hogs, 30,000 laying hens, or 50,000 ducks find Lactein profitable, why shouldn't you? No matter if you only have a few hens or hogs it will pay you to feed Lactein.

Lactein Is a Scientific Milk Product
produced under perfect sanitary conditions from fresh buttermilk, skim milk, whey and milk albumen at the creameries, cheese and casein factories on the Pacific Coast. It is put up in wood barrels of 5, 10, 25, and 52 gallon sizes. Sold by feed dealers. Should your local feed dealers not have Lactein, write us direct.

STRAY THOUGHTS OF A COWMAN

Written for California Cultivator By A. L. Spellmeyer

There is nothing like a business hitting rock bottom. Nothing worse can come, and anything will be better.

Nature must smile with grass and water; banks must loan money; beef comes from a cow; the boys will soon be home on the job, and even congress seems interested in the meat question.

Whether the packers run an eleemosynary institution for the welfare of cattle producers and the consuming public, as their advertisements indicate, or whether they are wolfing it in the skin of the calf, and the lamb, is not material to the fact that cows and yearlings will advance in price.

The law of supply and demand is working for higher stock cattle prices just as it worked against them, when trainload after trainload of cattle from the drouth stricken districts glutted Eastern markets. Those $60 up cows sacrificed as canners, to net $24 to $38, have a little voice saying stock cattle will advance.

The estimable bankers who during the drouthy spell close herded the dollars will soon have to let them out to graze. The cow man has even the prospect of a nod and smile from his ex-banker within the next year.

From Texas to Montana, and from Kansas to California, cattle will be in demand during 1919. California already is finding out that cattle are not as plentiful as was supposed sixty days ago. California has the advantage of a winter grass growing season and this gives six months advantage over some twenty other states that will soon be clamoring for cattle. California is at present asking for steers but will soon be talking cows, calves, or anything in live stock that can eat grass and get fat.

A lot of men say the hundred dollar range cow is coming. We hope so as producers, but that's too much money for a cow.

Not long ago when shipping to the Kansas City market, a nice bunch of grade whiteface heifers was alongside a pen of half-Navajo ewes. The heifers netted $28 at Kansas City; the measly, undersized ewes sold at $16 each, without shipping. The heifers weighed 500 pounds each, the ewes about 60. The ewe could have a $9 lamb the next year; the heifer would not bring returns until three years, and then a yearling, worth from $30 up, and which would under present conditions cost $30 and up, to raise.

There is going to be a shortage in breeding stock and yearlings. Aged steers are high and scarce now. It takes years to increase cattle production, and conditions can get no worse for the producer, so they must improve.

When our government gets the right hold on this squirmy meat question, we are going to see cattle production assisted and stabilized, but we are going to see within a year, no matter what conditions are, higher prices for cattle.

A TURNING WORM

"See that measuring worm crawling up my skirt!" cried Mrs. Bjenks. "That's a sign I'm going to have a new dress."

"Well, let him make it for you," growled Mr. Bjenks. "And while he's about it, have him send a hookworm to do you up the back. I'm tired of the job."—Liverpool Mercury.

ECONOMY IN LUBRICATION

One half of the troubles experienced with farm machines could be obviated if proper regard were paid to lubrication. This means, says F. A. Meckel of the University of Missouri college of agriculture, that not only enough lubricants must be used, but that they must be of the right kind. There can be no economy in using low grade oil and grease, nor in applying lubricants in less quantity than the machine requires.

Any machine which the farmer may own is entitled to the very best of treatment. Without that its efficiency is reduced, and this reduced efficiency is just the same in effect as needless expense in any other direction. The more complicated and valuable the items of the farm equipment are, the better the care to which they are entitled. Tractors, gasoline engines, binders, and the like, should receive only the best of everything, including lubrication, both in quantity and in quality. Farmers who own automobiles are beginning to learn the economy of an adequate use of lubricants, but they should not confine the application of this acquired knowledge to their automobiles. Give each machine on the place a chance to do its best. It can't have this unless it is lubricated properly. A bath of the very best oil on a bearing once a day is not the same as the same amount of oil distributed in equal parts to that bearing at intervals of 30 minutes. This implies the judicious use of the best oils that money can buy. To do anything else is false economy.

DEPARTMENT TO SELL NITRATE

The secretary of agriculture has announced that, under the authority of the food control act and subsequent legislation, the department of agriculture during the coming season will offer nitrate of soda for sale to farmers for fertilizer use. The nitrate will be sold for cash at cost. The price to the farmers will be $81 a short ton, free on board cars at the loading point or port. In addition the farmer will have to pay the freight charges to unloading point and any incidental expenses that he may himself incur in connection with the delivery of the nitrate.

Presumably this is of no interest to Pacific Coast producers, for as last year local freight rate will be necessary from some Atlantic port.

Book Review

PEACH GROWING

"Peach Growing" by H. P. Gould of the United States department of agriculture, published by Macmillan Company, 66 Fifth Avenue, New York, price $2.00. Although the development of peach growing in the United States has been coincident with the development of the country, peach literature is notably limited except as it appears in experiment station bulletins and reports. Of these there are many. The motive of this book is to present in a fairly comprehensive way the principles and practice of successful peach production. As to varieties, it makes recommendations, in lists taking up several pages, for sections covering the United States. For instance Ontario, Southern California, elevation 1000 feet, plant Elberta, Tuskena, Muir, Lovell, Phillips; these varieties mostly for canning. Other sections selected from California are Hanford, Vacaville, Yuba City, Newcastle and East Auburn. There are 426 pages filled with text and illustrations which makes a most complete account of peach growing in the United States. There are 18 chapters touching upon the status and extent of the peach industry; location and site; propagation; details of planting; management; tillage; inter-planted crops; fertilizers; pruning; insect and disease control; thinning; irrigating; a consideration of adverse temperatures; annual cost factors; varieties, botany and classification; picking and packing; transportation, storage, marketing.

CORROBORATED

"Madam," remarked the weary wayfarer with the bandaged eye, "I was not always as you see me now."

"I know it," replied the stern-visaged woman at the back door. "The last time you were here you had on a deaf-and-dumb sign."—Puck.

HALF

Calumet Baking Powder costs half what you pay for "Trust Brands." That is a big saving. And you make even a *bigger* saving when you use it—as you *use* half the amount generally called for by other Baking Powders—only a *level* teaspoonful to a cup of flour.

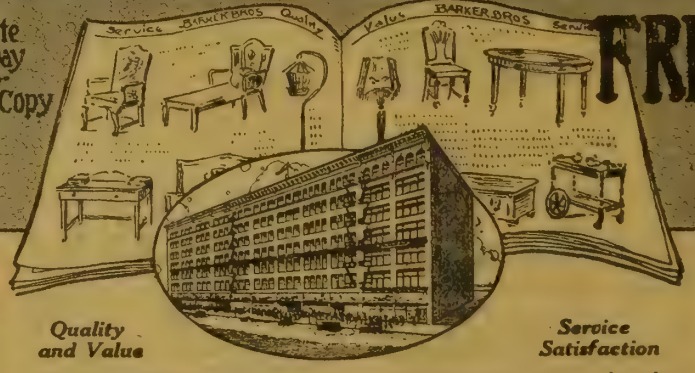
Calumet has the most leavening power and is so well made that it *keeps* its strength. When you use

CALUMET BAKING POWDER

you are certain of best results—light, tasty, wholesome pies, cakes, biscuits, etc. There is no loss. Things made with Calumet stay fresh, moist and tender.

Calumet is a perfectly manufactured baking powder—sold at a moderate price. It costs less than high priced trust brands. It is more economical to use than the cheap big-can kind. Try it.

And save a *lot* both ways.



Calumet contains only such ingredients as have been approved officially by the U. S. Food Authorities.

Household Department

THE TOAST

Fill, fill your glasses, gentlemen,
And let the toast go round
To woman, darling woman,
Wherever she is found.
Without her, even the fairest spot
On earth is dark and drear;
But with her, stormy winter seems
The summer of the year.

When Eve went out of Paradise,
Had Adam stayed behind,
To him no longer seat of bliss
If he were of my kind;
With her for his companion,
The wilderness was bright,
And every dim and desert spot
Endued with Eden-light.

Worlds have been lost, so poets sing,
By woman's artful wiles;
But who would wish to own a world
Without her sunny smiles?
Better to have the smallest house
Where ladies are about,
Than all the palaces of kings
And emperors without.

Then drink with fervent hearts and souls,
The toast that I propose;
To Woman! woman everywhere,
Creation's sweetest rose;
But chiefly those whom we love best,
Yes, dearer than our lives—
Our mothers, sisters, daughters, friends,
Our sweethearts and our wives!
—Unknown in Tid-Bits.

WHEN ROOSEVELT FACED WAR WITH GERMANY

THE crisis arose over Venezuela, which had come so near to precipitating war between the United States and England in 1895. Venezuela was now under the dictatorship of a shrewd and unscrupulous adventurer named Castro, who, secure as he believed, in the protection of the United States under the Monroe Doctrine, was cheerfully defying half of Europe. Venezuelan citizens owed large sums of money to Germany, England and Italy. Collection of these debts proved difficult. Castro intimated that Europe might come and get the money if it wanted it. Says Herman Hagedorn in October Boys' Life.

Germany, always on the alert for an opportunity to gain a foothold in South America, now approached the government of England and Italy with a view of effecting joint intervention to protect the interests of their citizens in Venezuela. Both nations agreed to cooperate, and all sent gunboats to blockade the Venezuelan coast. Castro protested vociferously to the United States. John Hay, secretary of state, answered that the Monroe Doctrine did not mean that the United States would preserve any South American nation from the consequences of its own financial indiscretions.

The so-called "pacific blockade" continued for a year. Numerous neutral vessels were sunk. Hay lodged an emphatic protest and urged arbitration. The allied nations refused, and on December 8, 1902, England and Germany broke off diplomatic relations with Venezuela, intimating that the next move would be the bombardment of Venezuela towns and the occupation of Venezuelan territory.

At this point President Roosevelt took charge of the negotiations. He saw that in the invasion of a weak debtor state by a naval or military expedition lay a threat against the Monroe Doctrine. He advised the nations to come to an understanding. England and Italy expressed their willingness to do so, but Germany refused, declaring that any occupation of territory would be only "temporary."

Roosevelt, having notions of his own about the probability of Germany's relinquishment of any territory on which she had once planted her flag, summoned to the White House Dr. von Holleben, the German ambassador. An American squadron, under Admiral Dewey, was off the coast of Cuba, he told him. Unless Germany consented to arbitrate her Venezuelan claims, he would order Dewey at noon ten days later, to proceed to the Venezuelan coast and prevent, by force of arms, if necessary, the landing of a German expedition.

A week later Von Holleben called again on the president. He talked on various matters. The one matter, however, that he did not touch on at all was Venezuela. But when he rose to go, Roosevelt asked him bluntly what answer he had received from his government.

Von Holleben was light-hearted about the matter. "You did not expect me to take your statement seriously?" he remarked. His government, he said, had not communicated with him.

The president snapped his teeth together. "Very good," he said. "I shall instruct Admiral Dewey to sail not in three days, but in two."

The ambassador was thunderstruck. His whole manner changed. He knew at last that he had made the most fatal mistake a diplomat can make—he had miscalculated the intention of his opponent. He protested that the kaiser could not give in.

"Do you realize," he cried in extreme agitation, "that this means war?"

"It means war," answered Roosevelt, "if Germany tries to land troops in Venezuela. But not a stroke of a pen has been put on paper. If the emperor will agree to arbitrate, I will heartily praise him for it and treat it as a token of German initiative. But I must have an offer to arbitrate in 48 hours or Dewey sails."

Within 36 hours the ambassador returned to the White House wreathed in smiles. A dispatch had just come from Berlin, he said, saying that the kaiser would arbitrate.

Roosevelt did as he promised and commended the kaiser publicly for being so staunch a friend of arbitration. Von Holleben was almost immediately recalled by his government. The affair evidently rankled in the emperor's mind. But his attentions to America and Americans increased in fervor. From the Venezuelan affair dated his almost romantic devotion to Theodore Roosevelt. The president had spoken in the only way William the Second understood; and in his curious, mediaeval heart the emperor loved Roosevelt for the very qualities which had revealed him as his master.

ROOSEVELT'S LAST PLEA WAS FOR AMERICANISM

What was the last public statement by Colonel Roosevelt was read at an "all American concert" in New York, under the auspices of the American Defense Society, of which he was honorary president.

It read in part:

"I cannot be with you and so all I can do is to wish you Godspeed. There must be no sagging back in the fight for Americanism, merely because the war is over.

"There are plenty of persons who have already made the assertion that they believe the American people have a short memory and that they intend to revive all the foreign associations which most directly interfere with the complete Americanization of our people. Our principle in this matter should be absolutely simple.

"In the first place, we should insist that if the immigrant who comes here does in good faith become an American and assimilate himself to us, he shall be treated on an exact equality with every one else, for it is an outrage to discriminate against any such man because of creed or birthplace or origin.

"But this is predicated upon the man's becoming in very fact an American and nothing but an American.

"If he tries to keep segregated with men of his own origin and separated from the rest of America, then he isn't doing his part as an American. There can be no divided allegiance at all.

"We have room for but one flag, the American flag, and this excludes the red flag which symbolizes all wars against liberty and civilization just as much as it excludes any foreign flag of a nation to which we are hostile.

"We have room for but one language here, and that is the English language, for we intend to see that the crucible turns our people out as Americans and of American nationality and not as dwellers in a polyglot boarding house; and we have room for one soul loyalty, and that is loyalty to the American people."

LIKE THE LETTER "P"

Gibbs: "Bilson expressed a good deal of sympathy for poor Blank. Did you try him for a contribution?"

Dibbs: "No, I know Bilson; he's like the letter 'P'—first in pity and last in help."—Boston Transcript.

A USE-EVERYTHING IDEA

Written for California Cultivator By "Subscriber, Santa Ana"

Here is a "use-everything idea." Whenever I want anything new I simply get out the flour and sugar sacks and make it. A sugar sack bleached and cut in four pieces, each piece fringed and whipped around the edge to hold it makes everyday napkins. Sugar sacks hemstiched on one edge make very nice serviceable curtains for kitchen and bedroom windows. All of my every day pillow slips are made of sugar sacks. My children's summer underwear is made of sacks. Hundred pound flour sacks make good sheets, when bleached, and do very well when sheets cost as much as they now do. Five sacks make a large sheet. I took a 25-pound flour sack and hemstitched it and put a little fancy work on it and behold I had a nice centerpiece for my dinning table and I didn't have to be careful of it either. Four 50-pound flour sacks make a nice tablecloth for everyday wear and look real enough when nice and white. Corn meal sacks make nice handkerchiefs whem hemmed and surely wash and look better than those horrid red and blue ones that lots of men use.

Flour sacks make good linings for bed quilts and crib quilts made of sacks and quilted on the machine will stand any amount of washing. Put a strip of sacking on the ends of your quilts, folded over and tacked down. This can be easily removed and washed and put back and your quilt is still clean.

If anyone can do any more with sacks I should like to have the idea. I buy sacks at bakeries and grocery stores.

(If "Subscriber, Santa Ana," will send name and address to this office her subscription will be extended one year.—Edit.)

HOUSEHOLD QUERIES

Cooking Dried Potatoes

Will you kindly tell me how to prepare potatoes that have been dried? I have tried several ways and each time the potatoes have remained tough and leathery. Following the instructions in a spring number of the California Cultivator, we dried our crop of potatoes. They dried nicely and have kept well; however, I have found no way to prepare them satisfactorily for table use.—Subscriber, Burbank.

Where the potatoes are dried without cooking they should be soaked for six or eight hours or over night, using eight pints of water to one pound of potatoes. They should then be cooked in the usual way. Where cooked before drying they are not supposed to need any preliminary soaking, but we think it would be worth trying. Have any of our readers found a successful way of cooking the dried potatoes? Dried string beans we have found delicious when soaked over night and cooked in a fireless cooker all day. A long slow heat seems to bring out the rich flavor and leave them very tender.

WASHING THE DISHES

Very few women like to wash dishes, but having convenient appointments and plenty of clean dry towels ready makes it less distasteful. The mechanical dish washer is a help in boarding houses or on large farms where there are several hired men to cook for. These washers are permanently attached to the sink and waste pipe, and they may eventually be improved so much that they are practical for the small family, but at present the large majority of housekeepers are using the old methods for this work.

An oblong pan fitting the shape of the sink is the best dishpan. Instead of a cloth use a cotton string mop. There is no reason why a housekeeper's hands should be red and rough if she will give them a little thought and care. Shake a little gold dust washing powder in the dishpan, and pour the hot water over it. The powder dissolves very quickly in hot water, and you are ready to begin. After the dishes are washed through the suds, adding boiling water from time to time to keep it hot, rinse glasses in warm water, and china in hot water, wipe them dry, and they will be clean and shining.

One of the first lessons taught young housekeepers is that their dish cloths should be immaculate. They should be rinsed and dried every time they are used, and either put in with the clothes when the regular washing is done, or washed and boiled in suds once a week, then rinsed in clear water and dried.—E. J. C.

ARE WE MODERN ENOUGH?

So many people laugh "modernism" to scorn, and will snap their fingers at you if you try to teach them that there is often a new and better way to do thngs. There is a distinction, and a decided one, at that, between modern ways and faddy notions. A modern means of plowing your acres, harvesting your crops or churning your milk is one that calls for new devices in machinery and new forms of management.

The reason that the people of India today are so backward and ignorant is because they believe in ancestral worship, and live only in the past. What has caused them to partially awaken, and make an attempt at throwing off their old yoke? It is nothing more than modernism brought to India by the English people.

Are we willing to live in a backward age, simply because our grandmothers lived then, and didn't know all that we know now? Wouldn't they laugh at us if they could and suggest progressiveness? Yes, we all know that to be true. The people who are considered the most intelligent, and who are leaders in their home life, business life and in society, are the men and women who look ahead, keep apace with the times, and have as their motto, "Progress."

Don't be afraid to take hold of new things, and at least test them until they fail. When you know that a word which you have always pronounced one way has had its pronunciation changed, practice speaking the word until you are sure of yourself, then don't hesitate to use it.

Changes are things that we all hate to see come upon us, still we realize that they are inevitable, and we have but to adapt ourselves accordingly. This is an age of awakening interests, advancement and changes. What we did yesterday, tomorrow we may do in a new and better way.

If you do not want to cook a whole pumpkin at once, a piece of plain white paper pressed over the cut portions of that left will almost seal it air tight so that it will keep quite a while in a cool, dry place.

Uncle Sam's Fighting Boys Wear IRONCLAD KHAKI

Twill Cloth

You men and women of his "home guard" should wear this patriotic economy cloth, too. It's fast color and wears like leather.

Overalls, Coveralls, Shirts and Pants

Made of the genuine Ironclad Khaki (the kind Uncle Sam uses) carry the yellow "army" label, like the above. Look for it and Guaranteed Bond in the garment before you buy.

Write today for free samples of Ironclad Khaki Cloth, and Miss Ironclad Khaki, the kid glove finish ladies' overall cloth.

Ducks, 30; ducklings, 32; geese, 28; turkeys, 34@35; squabs, 40-43; Belgian hares, 20.

LIVESTOCK

The market for steers and cows is advancing steadily due to the fact that range cattle are about all marketed. The increased cost of feeding beef producing animals, hay and grains warrants an advance. Cows especially are in good demand but the supply of them is decreasing at an alarming rate.

Hogs are on the decline at the present time. Prices now paid by local packers figure a full dollar lower than a week ago. The oversupply of hogs in all packers' pens is responsible for the downward trend.

Lambs are in better demand especially those of good quality. An early advance in price is anticipated. Mutton is considered bad property. Ewes are plentiful but buyers do not need them as the demand for the dressed product is very poor.

Report of live stock conditions on the Los Angeles market as compiled by the United States Department of Agriculture, Bureau of Markets, through the local office. The following are live stock prices on the Los Angeles market f. o. b. packers' yards. Prices at country points are $1.00 to $1.50 per cwt. less than these quoted:

Good Steers .....13.50@14.25
Med. Steers .....12.00@13.00
Common .....11.00@12.00
Good Cows .....11.00@11.50
Medium Cows .....9.00@10.00
Common and canners .....6.50@7.50

Prices quoted below are for carload shipments f. o. b. slaughterers' pens. Driven-in, or truck hogs sell for ½ cent less.

Hogs—
No. 1 hogs, 150-225 lbs. .....16.00@16.50
No. 2 hogs, 250-350 lbs. .....15.50@16.00
Sheep—
Lambs, 65-80 lbs. .....15.50@16.00
Wethers .....11.50@12.00
Ewes .....8.50@10.50

St. Louis: 5 oranges, 1 lem. Nav. 3.00-4.85, seedlings, 2.35-3.65, lem. 2.80-3.90.

January 21

Boston: 7 oranges, 1 lem. Nav. 3.40-4.50, Val. 3.95, lem. 2.80-3.45.

Pittsburg: 2 cars. Nav. 4.35-4.65.

Philadelphia: 1 orange, 1 lem. Nav. 4.60-4.85, lem. 1.60-2.20.

PARTIAL LIST CALIFORNIA FRUIT AND VEGETABLE SHIPMENTS

From post card reports to the Los Angeles branch of the bureau of markets, report is made of the following shipment of cars of products from California for the week ending January 20: Apples, 32; cabbage, 56; carrots, 2; cauliflower, 59; celery, 178; dried apples, 5; dried apricots, 2; dried beans, 64; dried olives, 1; dried peaches, 27; dried peppers, 6; dried prunes, 12; grapes, 1; lettuce, 23; mixed fruit, 2; mixed vegetables, 72; mixed fruit and vegetables, 28; mixed dried fruit, 13; olives, 1; onions, 12; pears, 1; pomegranates, 1; potatoes, 152; raisins, 266; spinach, 15; sweet potatoes, 14.

MARKET NOTES

Los Angeles quoted on Monday arrivals of 12 cars potatoes, 4 celery, 1 lettuce, 1 oranges. Besides these there were local smaller shipments of garlic, cabbage and celery.

The latest United States department of agriculture bulletin of Wednesday notes California Limas ranged slightly lower in leading terminal markets at $11.00@12.25 per cwt. declining 25@50 at shipping points to $9.50@9.75 to growers, recleaned basis. Colorado Pintos were also slow and weak. Sacked Michigan pea beans were slightly lower at shipping points at $7.50@8.00 per cwt. to growers, hand picked basis, moving slowly at $9.35 @10.00 in terminal markets. Shipments were slightly heavier.

A look over the honey market indicates a range of prices from 20 to 26 cents for white and water white.

Kale, spinach and other truck crops were seriously injured in Virginia by the early January cold spell.

Florida's acreage of winter cabbage is only 40 per cent of that of last year.

Florida's shipments of garden peas begin about March 15. The crop is much smaller than former seasons.

Butter scoring 92 is now selling in Chicago around 61 cents.

California Iceberg lettuce is reported very firm at $3.25@3.75. Imperial Valley lettuce advanced 50 cents at Chicago, Pittsburg and other markets.

Model 90

Overland

TRADE MARK REG.

The Thrift Car

Where every farm is the home of an automobile you have a prosperous community.

And in such communities the name Overland has come to mean a very definite thing—*ruling sensible automobile value.*

To make this definite meaning of the Overland name ever more clearly apparent has become our greatest obligation.

This season the Model 90 Overland Thrift Car, true to Overland tradition, fulfills this obligation.

It stands today, on its name and record, the *ruling sensible automobile value* of the hour.

This is the judgment of over one hundred thousand purchasers of this one model.

It will be *your* judgment if you sift all the facts for the final truth.

If you intend purchasing a car this season see the Overland dealer now—the demand will probably exceed the possible supply for some time to come.

Acres of Lettuce in Arizona

$7.50 After 30 Days' Trial

Great Belgian Melotte

JULES MELOTTE—"The Edison of Europe"—has won for Belgium a world-wide reputation for perfect skimming methods. Belgium, the greatest dairy country—whose farms average less than ***six acres apiece*** —saves ***every atom. Waste*** is ***unknown.***

Jules Melotte has made more valuable cream separator patents than probably ***all other inventors together!*** These wonderful patents—combined in the great Belgium Melotte Separator, the winner of 264 International Grand Prizes—he now offers to the dairymen of America.

With Mr. Melotte's co-operation, his great separator is now being made in this country. His American-made Melotte exactly duplicates his famous Melotte Separator made in Belgium. It is built on the same millimeter measurements—accurate to the 1/1000 of an inch. ***No other separator in the world*** is like the famous Belgian Melotte—now made in Belgium AND IN AMERICA! Remember—there is ***no import duty*** and ***no ocean freight*** to pay. Seize this opportunity!

Free Trial

No money down—30 days' free trial—then, if satisfied, only $7.50 and a few monthly payments—AND—the wonderful Belgian Melotte is ***yours.*** Write today for catalog—it tells all. Before you buy ***any*** separator, we want you to TRY—***at our expense***—this ***prize-winning*** separator of all Europe. We want you to use it as if it were your own. Put it to every test. Then, after 30 days, return it if you choose. We will pay freight both ways—the trial won't cost you a cent.

No Money Down

We want you to know before you pay any money that the Melotte will please you. Use it for 30 days. See how easily it operates. See how easily it is kept clean and sanitary. Note the simplicity—the durability. ***Test the Self-Balancing Bowl!*** Learn why the bowl can't vibrate or get out of balance—why it can't remix the cream with the milk—why it is the recognized world's closest skimming device! Compare Mr. Melotte's great separator with all others. Do this: Get them ALL on trial. Test the Melotte side by side with every other separator. See which works the easiest—which is most profitable—which operates at least expense—which is most sanitary and easiest to clean. Then, take your skim milk to a creamery—let ***them*** prove which separator skims the cleanest! We ***welcome*** such a test! Mail coupon ***at once***—get full details.

Easiest to Clean

Few plain discs, all alike, go back in bowl in any order. Bowl chamber is

Porcelain Lined

Has smooth, rounded surface—no crevices. Easily kept clean and sweet. Can't rust. One-half less tinware.

Easiest to Turn

We guarantee the 600 lb. capacity Melotte turns easier than any other separator of 500 lb. capacity. Bowl spins 25 minutes after you stop cranking unless you apply brake. No other separator needs a brake.

Easy Payments

If, after 30 days' trial, you are convinced—as we know you will be—that Mr. Melotte has the best cream separator on the market; that it will get more cream and bigger profits; that it will wear longer, work easier and give greater satisfaction than any other separator—send only $7.50. Buy direct from the Melotte factory in America on our rock-bottom factory-to-you price offer. Only $7.50 as a first payment, if satisfied after trial—balance in small monthly payments. Pay right from your increased profits! Let the Melotte ***pay for itself*** while it works for you! Get full particulars. Write or send the coupon ***at once.***

Valuable Books FREE

"Profitable Dairying", a valuable 88-page book on dairying, is the work of B. H. Benkendorf, Wisconsin Dairy School Agricultural College, and K. L. Hatch, Winnebago County Agricultural School, Winneconne, Wis. Contains no advertising. A real, practical, commonsense treatise, telling everything about cows and dairying—how to feed and care for cattle—how to make more money out of your cows. Every farmer should have this book. Sent free—together with our Melotte Catalog which gives the full story about the Melotte Separator and its inventor, Jules Melotte. Catalog also gives details of our iron-clad, 15-year guarantee which is ***100% stronger*** than any other cream separator guarantee! Get these books FREE! Mail the coupon now!

Caution!

Vibration of the bowl will quickly cost you more money in ***cream waste*** than the price of your separator. U. S. Gov't. Bulletin No. 201 says that a perfectly true motion of the bowl is absolutely necessary. The bowl is the ***vital*** part of the separator—the part where the cream separation takes place. Jules Melotte—with his wonderful patented ***self-balancing*** bowl—has solved the problem of perfect skimming.

Self Balancing!

The Melotte bowl is the ONLY ball bearing separator bowl. It CANNOT vibrate. It hangs down from a single ball bearing and spins like a top. Can't get out of balance—can't vibrate—can't cause currents in the cream—can't remix cream with milk.

California Cultivator

Vol. LII, No. 5 Los Angeles: February 1, 1919 One Dollar Yearly

Get That Squirrel!

By C. A. Nidever

GROUND squirrels cost the state of California about $30,000,000 each year in damage done to crops alone. Counting the cash outlay for poison that runs from $5.00 to $5000 to individual farmers who fight the squirrels, the cost would probably be increased by another half million.

The $30,000,000 crop damage is waste, pure and simple, for the ground squirrel can be exterminated. Much of the cost yearly to individual farmers is waste also, for the squirrel cannot be exterminated by individual effort, but only controlled on the individual place temporarily. As soon as the farmer lets up on his war against the squirrels on his place they immediately move in from adjoining ranches. Thirty million dollars is a considerable sum of money to throw away. Thirty million dollars worth of wheat, beans, corn, barley, potatoes and fruit go to feed useless ground squirrels each year while human beings are starving in Europe. And there is no excuse for the squirrel except indifferent land owners, principally land speculators, and indifferent county boards of supervisors, as the ground squirrel can be exterminated by organized systematic effort. A state law which became effective July 27, 1917, gave the county horticultural commissioner the power to enforce squirrel eradication.

Section 2322a, Chapter 508, Political Code, Statutes 1917, says, "It shall be the duty of the county horticultural commissioner in each county whenever he shall deem it necessary to cause an inspection to be made of any premises and if infested with animal pests, etc., he shall in writing notify owner or owners and require such persons to eradicate or control such pests to the satisfaction of the county horticultural commissioner, within a certain time to be specified in such notice. If such notice shall not have been heeded within the time specified in such notice it shall be the duty of the county horticultural commissioner to cause such nuisance to be abated at once, in a summary manner, by destroying said pests. The expense thereof shall be county charge, and the board of supervisors shall allow and pay the same out of the general fund of the county, any or all sum or sums so paid shall be and become a lien on the property and premises from which said nuisance has been removed or abated, such lien to take precedence over all other liens with the exception of taxes."

"The district attorney shall within 90 days after abatement of nuisance, commence suit to foreclose the lien, and, if necessary, sell the land to pay costs of squirrel eradication and of the suit."

The supervisors of some counties have refused to put aside money to pay field men to poison squirrels on property where owners refuse to do so, though the law plainly specifies that the money so set aside and expended is a lien upon the property where eradication work is done and all such money will be returned to the county treasury.

In one county where the damage done each year by the ground squirrels is estimated at $1,000,000 the supervisors have persistently refused to appropriate moneys to properly enforce the law. A million dollars is a lot of money for farmers to lose each year, but it seems that a bunch of land speculators' votes that could be gained by holding down expenses for them look bigger to these supervisors. However, the county horticultural commissioner, who has the work in charge, after pleading in vain, decided that he was being paid to get results instead of playing politics, so went over the supervisors' heads and appointed field men to inspect and poison with the understanding they were to sue the supervisors for their salary.

The state law gives the commissioner the right, and it is his duty, to enforce the law and the supervisors must pay the bill whether they like it or not.

State Commissioner of Horticulture G. H. Hecke, realizing the necessity of coordinating the efforts of 50 county horticultural commissioners, in January, 1918, organized the rodent control division of the state commission of horticulture. W. C. Jacobsen, assistant United States biological survey, who during the summer of 1917 did such excellent work in starting squirrel eradication in California, assisting the county horticultural commissioners over the state whenever possible, heads the rodent division as superintendent, and S. V. Christierson, formerly county horticultural commissioner of San Luis Obispo County, who started the first squirrel eradication campaign in the state under the law of 1917, was chosen as assistant superintendent. With the aid of three field assistants they are organizing the work and aiding the county horticultural commissioners in every county in the state.

The squirrel and the kaiser are in the same class—undesirable citizens—and they must go! It is up to every individual, especially the farmer, to help. Help organize locally for distribution of poison and carbon bisulphide, demand that the supervisors furnish inspectors and assist the county horticultural commissioner in his work. The best means of advocating squirrel eradication is through farm bureaus, chambers of commerce, county papers and various farm organizations. Squirrel eradication is of as much importance to the town people as to the farmer. One of the best means of reaching the business man is through the chamber of commerce. In counties where inefficient supervisors block the way, it is the duty of the farmers to insist on action.

During the past war farmers were urged to produce to their limit. Last year one patriotic rancher, induced by Mr. Hoover's call for more food, took a chance and planted about three acres of corn on some summer fallow land. Across the road from this farmer's little ranch lay about 400 acres held by a land speculator. This 400 acres was well stocked with squirrels. The little corn patch escaped great injury until ripe, then the land speculator's squirrels harvested Mr. Hoover's corn. If Mr. Hoover sends another call for more food there is one farmer who will say "Never Again." While Mr. Hoover's corn was being harvested, the county supervisors were deliberating over what to do with the squirrels. In that county the damage done was estimated to be over $1,000,000 annually.

Progressive Tulare County has distributed about $37,500 worth of poison barley and $2700 worth of carbon bisulphide. Over there they know that it does not pay to feed ground squirrels. Of the 58 counties of California, 10 have done absolutely nothing in the way of squirrel control, 14 have made poor progress, 19 counties have made fair progress, while 15 are classed as commercially free of squirrels. Tulare has mixed and distributed over 125 tons of poisoned barley and about 3000 gallons of carbon bisulphid. Tulare also has employed ten inspectors for the last year. Kern County has distributed about 80 tons of poisoned barley and employed four to eight inspectors for the past year.

San Joaquin County during last winter, the campaign not starting until December, distributed nine carloads of carbon bisulphid and has done a great deal of work towards forcing recalcitrant land owners to clean up.

Ground squirrels are being eradicated on state lands by state crews under supervision of the rodent control division of the state commission of horticulture. Dr. W. B. Bell, assistant biologist, United States bureau of biological survey, estimates that after his bureau had eradicated ground squirrels in the national forests of California, the carrying capacity of the range was increased by 20 per cent.

Commissioner C. C. Staunton of San Luis Obispo County has divided his county into districts. Each district will be cleaned up at a given time. Where individuals will not poison, the work is being done by men appointed by Staunton.

Methods Used in Squirrel Control

The two best agents for destruction of ground squirrels are poisoned barley and carbon bisulphide. Generally speaking, carbon bisulphide is used during the winter, while poisoned barley is used during the dry season. To get the best results in fighting the ground squirrel one should know something of their habits. It is thought possible that during late fall the old squirrels hole up and remain in a dormant state until spring, while the young squirrels remain active all winter. Some investigators have found that in holing up, the squirrel will dig from the bottom of his burrow to within 12 to 18 inches of the top of the ground, make his sleeping quarters and then plug up the hole with dirt. Nature tells him to do this to protect himself from being drowned by storm water filling his burrow during the winter.

The proper method to follow in using carbon bisulphide is to use a 1½ gallon bucket covered with a tight lid. In this 60 wasteballs should be immersed and soaked well in the carbon before using. Remove the saturated wasteball by hand or by means of a wire hook, inserting one saturated wasteball in each squirrel burrow. If the hole is not to be fired, cover up immediately with moist earth and tamp well to prevent an escape of the deadly gases. If firing or exploding is practiced a length of time varying from three to ten minutes should be allowed to elapse before a match or torch is applied. This will allow the liquid carbon bisulphide sufficient time to vaporize. Cold damp weather calls for longer periods to insure vaporization than warm sunshiny weather. In all cases the burrow should be tightly sealed following ignition. Every burrow must be treated. Extra large burrows may require more than one saturated wasteball. A little more gas is better than one live squirrel, as one squirrel left will open up a half dozen holes if given a little time, which means more work later on.

A very effective time to use carbon bisulphide is after the squirrel has come out of the dormant state and opened up the burrow, which may be as early as January or as late as the first part of March. From the first of March to the first of June the work of carbon bisulphide is 95 per cent perfect, all the squirrels being active and the ground being in condition to retain all of the gas in the holes.

Two men can work best with the carbon bisulphide or gas method, as it is usually called. One man carries the waste balls and gas, placing the soaked wasteball in the hole while the next man fires the gas and covers the hole. As the carbon is very inflammable great care should be taken if one man is doing the work alone. As the gas evaporates rapidly the main supply should be kept corked, taking out a small supply with which to work. After the grass becomes dry, carbon is dangerous to use on account of setting fire when exploding the gas. Also the ground becomes too dry and porous permitting much of the gas to escape without effect.

After the conditions are no longer suitable for the use of carbon bisulphide the work with poisoned barley should start and be continued through the summer and fall.

A large spoonful of the poisoned grain scattered a few feet from the hole is sufficient for one dose. The grain should be scattered on clean ground when possible and not directly in front of the hole where it is liable to be covered by dirt thrown out of the hole, but principally along the hard trails made by the squirrels, known as runways.

Best results can be obtained by putting out ample amounts of poison at a time and not going over the ground too frequently. Go over the ground once thoroughly then wait a week or two. After the second time go over the ground with a hoe or shovel and cover all the holes. In a week go over the ground and poison all holes that have been opened up. In this manner only the live holes are left to be poisoned and the territory is soon narrowed down.

Squirrels will raise on the average a litter of eight every year. For every squirrel that you leave on the ranch this year you will have eight to contend with next year. Count your squirrels and figure it out.

Continued on Page 155

Agricultural News Notes of the Pacific Coast

Northern California

El Dorado County is increasing her mileage of good roads.

The Western Berkshire Congress now meets at Davis, February 19-20.

The four months creamery practice course has started at the Davis farm.

An act has been introduced into the legislature to standardize fresh fruit containers.

The national rabbit show was held in San Francisco last week at the Civic Auditorium.

A tractor course will be given at the Gridley high school for three weeks beginning February 3.

At the recent meeting of the Orland farm bureau center H. M. Kingwell was elected president.

The state highway is completing connection of Oroville with the main state highway to the west.

The lands about Oroville, Butte County, are now being tested out as long staple cotton producers.

Residents of Big Valley filed a protest against Big Valley Irrigation District or what is generally called the Round Valley project.

There will be farm bureau meetings of Shasta County at Fall River, January 25; Burney-Hat Creek, 26; Millville, 28; Whitmore, 28.

The California International Live Stock Show which was to have been held February 8 at San Francisco has been postponed until next fall or winter.

Gridley, Butte County, shipped out during the month of December 139 carloads of foodstuffs. Forty-seven of these were rice and rice bran, and 34 barley.

At the recent meeting of Florin Fruit Growers the following directors were elected: G. B. Fell, J. W. Holmes, G. H. Nesche, J. Morris, J. E. Thomas.

Tomato growers of northern Sonoma County have united with the California Tomato Growers Association and a large acreage will be grown next season.

The state railroad commission has denied the petition of warehouse men for increase of weighing and handling charges in Sacramento, Oakland and San Francisco.

Nevada County has called off for an indefinite period all meetings of the farm bureau because of the influenza epidemic. Outdoor demonstrations will however, be held.

The Sacramento Cow Testing Association is planning a cow testing competition with many prizes offered. The association has members in Sacramento, Yolo, Solano, and San Joaquin Counties.

At a meeting of the Thermalito farm center it was decided to conduct a series of experiments during 1919 to determine if a way can be found to stop the heavy orange losses caused by the "June drop." The experiments will be carried on under the direction of Farm Adviser W. L. Sweet.

In the dispute between water users and the water company in Butte County the users refused to pay a rate which they claim was greater than that permitted under a contract made with the company. The railroad commission has, however, endorsed the rate made by the company and the users are compelled to pay.

Central California

The California Peach Growers is still handling a few dried peaches.

Turlock shipped out some 15 tons of turkeys during the holiday season.

Kings County farm bureau is making a campaign for a hundred new members.

Sugar beet growers of Stanislaus County report one half the crop of that county as already planted.

Dos Palos, Merced County, has a vision of 10,000 acres of long staple cotton planted during the coming season.

Turlock, Stanislaus County, shipped 210,000 pounds live poultry and 94,000 pounds dressed poultry during 1918.

Fresno County farm bureau recently sold seven cars of fat hogs at auction, ranging in price from $15.15 to $15.85.

Farmers of Tegner, Stanislaus County, are discussing whether to grow cantaloupes during the coming season.

A government terminal warehouse has been established at Stockton, San Joaquin County, for the benefit of wheat growers.

A recent sale of fat hogs at auction by the Kings County farm bureau showed a return to the producers of $16.35 per hundred.

The last of the sweet potatoes are being put on the market. One Turlock firm is sending three to four carloads a week to San Francisco.

Beet dumps to the value of over $50,000 have recently been constructed in Southern Santa Clara County. The beets will be delivered to Spreckels.

Wine grapes have brought record prices in Fresno County this year. Zinfandels brought a general price of $50 per ton. Alicante Bouchets commanded a premium throughout the season, sales being reported at $65 to $80.

The Tulare fruit grower who sold his oranges in 1916 but acceptance by the buyer was refused because he claimed they did not come up to the standard and the fruit afterwards was frozen, has been given a verdict of nearly $1000.

February farm bureau meetings of Stanislaus County: Hughson, 3; Modesto, 5; Jennings, 5; Mt. View, 7; Denair, 10; Mitchell, 11; Valley Home, 12; Tegner, 14; Orange Blossom, 15; Wood Colony, 17; Hickman, 19; Fairview, 21; Claus, 26; Ceres, 27; Patterson, 28.

At a recent meeting of Tulare orange growers with Deputy Horticultural Commissioner Weldon a resolution was adopted favoring the enactment of a law which would require 40 per cent of natural color on the orange that reaches the test of eight parts of soluble solids to one of citric acid. This would do away with sweating of green colored fruit which tests up to the chemical standard.

An olive grower of Oakdale, Stanislaus County, is shipping fresh green olives to New York by express to be pickled there. Some New York buyers claim that olives hold their flavor better if shipped green, and as this deal is by way of trying out the theory the experiment will be watched with interest by a good many growers and buyers. Mr. Bayer received $1200 for the olives on his three acre grove.

Southern California

All packing houses are now running full handed on oranges.

In spite of frost, oranges to the value of $40,000,000 will go East this season.

Riverside County Tepary bean growers are endeavoring to secure market in Europe.

Moonlight hunters of wild ducks are finding themselves in bad in Santa Barbara County.

Frost injury to orange groves of Southern California is now estimated to be from 10 to 12 per cent.

The first carload of marmalade shipped by the Redlands Fruit Products Company went to New York.

Brawley, Imperial County, claims to supply Los Angeles with some of its best baby beef and fresh pork.

The California Lima Bean Growers' Association has decided to sit tight and hold beans until a better outlook.

Walnut growers of Southern California recently met at El Monte and discussed pruning and codling moth control.

Ventura County bean growers are thinking seriously of "starting something" to move their warehouse beans onto the market.

Corona, Riverside County, growers who now have large supply of beans on hand are contemplating planting peanuts another year.

The farm bureau of Orange County has been giving special attention to poultry work. E. J. Hauser has been working with Farm Advisor Wahlberg.

The Orange County Farmers' Mutual Fire Insurance Company has over $6,000,000 in insurance written. Losses during 1918 amounted to a little over $4000.

Imperial County farm bureau is considering making request that cotton gins of Imperial Valley be placed under the public service law. This in the interest of the small grower.

Imperial County's largest shipment of live stock has been made to Eastern markets, a recent shipment being worth $150,000. There were 65 cars in the train made up of 35 beeves, 20 hogs, 10 sheep.

The Riverside County farm bureau recently conducted a meat cutting demonstration for the benefit of both the producers and consumers, the consumer being given special instruction in choosing of chops, loins, steaks, etc.

The board of supervisors of San Bernardino County is protesting at any effort to dump German produced potash in this country at low prices. San Bernardino County is contemplating the development of a great potash industry.

The Beekeepers' Association of Riverside and San Bernardino Counties has reelected its old officers. They are: president, H. T. Wagner, Redlands; vice president, J. A. Mack, Bloomington; treasurer, R. Powell, Riverside; secretary, E. W. Horne, Riverside.

The Riverside Press estimates the output for the present season of oranges from Southern California, 31,000 cars; Central California, 3200; Northern California, 250 cars. Of lemons there will be 7000 cars from Southern California and about 300 from Central California.

The Coast and General

The cantaloupe acreage in the Salt River Valley will be about 4000 for 1919.

One million dollars worth of sugar has been manufactured at the Yakima, Washington, factory.

The 14th convention of the Rivers and Harbors Congress will be held in Washington, February 5 and 6.

Klamath Falls, Oregon, claims an alfalfa and barley production aggregating nearly one million dollars.

Phoenix, Arizona, is improving her parks with a view of providing a public playground for the children of the city.

Hop growers of the Yakima Valley, Washington, are so sure there will be no further market that almost every hop yard in the valley is being plowed up.

Long staple cotton which for a number of weeks has held steady at 56 cents a pound advanced recently to 59 cents and some extra choice sold for 62 cents.

A new court house for Maricopa County, Arizona, is contemplated and it is likely that an election for bonding the county to build one may be held later in the year.

Among the moving picture scenes of American farm life to be shown in France to the American army will be scenes from the Salt River Valley and the Roosevelt dam.

Seven acres of cotton burned recently south of Mesa, caused by the carelessness of a Mexican who threw a lighted cigarette in some dead grass on the edge of the field.

Copper production in Arizona for 1918 totaled 777,000,000 pounds, the largest amount ever produced and leading all other states. The value was placed at $192,000,000.

A Hindu farmer from the Imperial Valley has purchased some land south of Chandler, Arizona, and announces that he will induce more of his countrymen to settle in the Salt River Valley.

Farmers in the Gila Valley near Florence, Arizona, are quite hopeful of getting together on a plan that will enable the reclamation service to take over their irrigation system and build a diversion dam.

About 450 birds were cooped at the midwinter show of the Maricopa County Poultry Association, held in Phoenix, Arizona, the first four days of the year. This was the most successful show yet held by the association.

The northern Arizona fair association has been reorganized in order that a fair may be held this fall at Prescott. Fairs have been held each season for a number of years until last fall when it was abandoned owing to influenza conditions.

An aerial stage line from Phoenix to Globe will, it is expected, be in operation within 60 days. A big Handley-Page plane capable of carrying 60 passengers has been ordered. Governor Campbell has accepted the invitation to make the first trip.

Governor Bamberger of Utah has announced that an effort will be made to annex the Arizona "strip," or that portion of the state north of the Grand Canyon, to Utah. It is reported that Governor Campbell of Arizona is disposed to consider a plan for annexation.

Lettuce in the Salt River Valley

By M. E. Bemis

AS a commercial crop lettuce in the Salt River Valley of Arizona is comparatively new. It was only a few years ago that one enthusiastic truck gardener, J. S. Heard of Phoenix, produced a carload of lettuce which was shipped back East and brought returns that at once showed the possibilities of this crop. The following year there were many enthusiastic growers that put in a considerable crop. Unfortunately their experience was far less in evidence than their enthusiasm, and in consequence there were some failures as well as many successes. Since then, and for the past two or three years, lettuce has been recognized as one of the principal crops which may be raised in this valley. For the past two seasons the shipments have been close to 100 carloads each season. The acreage at the present season, especially in the Glendale district, has been increased considerably and it is probable that the shipments this year will be larger than in previous years.

Lettuce is one of the few crops that makes its principal growth during the winter season. It is possible to mature lettuce in December and, as a matter of fact, lettuce is being shipped now as well as supplying local demands. For the local demand and that of the nearby markets, lettuce is planted as early in the fall as it will mature. Usually this is not earlier than September. For the main crop it has been found that the lettuce which reaches the Eastern market just after the California and Florida lettuce is off the market brings better prices. Consequently, the aim of the grower is to produce lettuce continuously from about January 15 to early March.

The most popular variety grown here is that which is generally known as the "New York Market," although this sometimes appears under different names such as "Wonderful" and other local names.

At the agricultural experiment station at Mesa, two years ago, 47 different varieties of lettuce were grown and the "New York" was pronounced the best variety for this section, although "Iceberg" may be considered a close second. Of this variety the official report of the experiment station says: "Next to the New York Market this is the best variety for Arizona. Late in spring it heads better than New York and is therefore popular with gardeners during this season. The heads are generally smaller, lighter in color and the leaves are more wrinkled than New York. The head is solid and of fine texture. The touch of bronze adds to its appearance."

Other varieties are grown to a small extent to supply local needs or for home gardens. Those who are most successful in growing lettuce are those who give a great deal of attention to the selection, preparation and fertilization of the soil. Most lettuce is grown upon the sandy loam or upon the Glendale loess soil, although exceptionally good yields have been obtained upon the heavy adobe soil.

Lettuce is a crop that requires a very rich soil, and growers now recognize the necessity of heavy fertilization. Cotton seed meal was used at the experimental farm, but best results were obtained where about 20 tons of stable manure was used. This should be plowed under in the fall, the ground then thoroughly plowed and worked, ridges being thrown up 24 inches apart. Some growers have planted on both sides of the ridges, leaving the rows on the ridges about 12 inches apart and thinning the plants in the row to 12 inches. This method makes it necessary to do a great deal of hand work, and most growers prefer to plant on one side of the ridge only, thinning as previously mentioned to 12 inches. Many growers prefer to have the rows run east and west, and for the early planting the seed is scattered with a hand seed drill on the north side of the ridge. For a later planting, October and November, the seed is sown on the south side of the ridge, the ridge forming a slight protection. The seed is not covered more than one-half an inch deep. About three-quarters of a pound of seed is required to plant one acre.

Irrigation is frequent and cultivation should follow each irrigation. There is very little lettuce transplanted, although it is possible to make transplanted lettuce grow very readily. This, however, seems to have a tendency to set it back so that it is several weeks later than where planted direct in the field.

Lettuce weighing 43 pounds to the crate of 24 is sometimes produced. The size and quality of the lettuce produced here has made a reputation for the Salt River Valley lettuce which sells it on its own merits even where there is considerable competition. Fortunately, there is not very much trouble from insects or from plant disease. The chief insect enemy of lettuce is probably the grasshopper which sometimes would clean up plants when they first appeared above the ground if they were not promptly poisoned. Poisoning insects with poisoned bran mash is a simple matter and enables the grower to easily keep them under control so that they do not become a serious menace.

In shipping lettuce a two tier ventilated crate which is paper lined and holds 24 to 40 heads is used. The usual method of harvesting is to withhold the water for two or three weeks before cutting. The lettuce is cut when there is no dew or rain on it and carefully packed in the crate. General practice is to pack the lettuce, then load the crates into the iced cars. During the latter part of the season cracked ice is usually packed between the two layers in the crate. Another protection is to ice the cars some time before loading so that they are thoroughly cooled and the lettuce is then packed for shipment. With due care in the selection of markets and keeping in close touch with market conditions, growers have usually obtained prices which makes this industry quite remunerative.

William Thompson, secretary of the United Produce Growers at Glendale, states that gross returns last year ran from $350 to $500 an acre. The net profits after all expenses were paid ran from $150 to $200.

According to reports of the United States reclamation service for 1917, the average production was about 200 crates to the acre.

Lettuce may now be considered one of the staple crops of the valley, and while the acreage will never make it a serious competitor of cotton, the fact that it is grown in the winter season and that the land is then ready for cantaloupes or some other small crop will ever make this one of the most attractive crops to the small farmer.

Annual of the Pear Growers

THE California Pear Growers Association held its regular annual meeting at the office of the association in San Francisco on January 20. The following directors were elected: R. J. Coggeshall, R. C. Dorsey, F. A. Edinger, J. F. Elliot, P. J. Huth, H. C. Melone, R. D. Moyer (Los Angeles), E. C. Rand (Sonoma), Frank T. Swett, F. A. Wilcox, G. W. Whitman.

The directors' meeting was held at the same date, at which the following officers were elected: President, Frank T. Swett; vice president, P. J. Huth; secretary-treasurer, F. A. Edinger; assistant secretary, A. D. L. Hamilton.

The association is sending out its first annual statement in which the business of the past three years is reviewed and in which we note this striking statement: "In 1918 we sold canning pears valued at $390,108.44. The same tonnage if sold at 1917 prices would have brought only $210,000. Therefore the gain to growers over 1917 prices was $180,000." "These gains were in a very large degree due to the work of the association secured at a wonderfully low cost. Does organization pay?" This statement contains a number of pungent statements from which we quote:

This coming season, fortunately, the trying war conditions will no longer prevail. The grower will be in a position to choose between a safe price in California through the association, or a prospective good price in Eastern markets, as settled by supply and demand. We look forward confidently to better railroad conditions, to better icing, and to better time between California and Eastern railroad points.

Hoover says the whole world will be hungry for two years to come. In the past, before the war, Great Britain was one of the principal markets for California canned pears. There has been an embargo on shipments of canned pears for the civilian population of Great Britain. We look for the lifting of the embargo, and trust our British friends will make up for lost time by using their full quota of our delicious fruit.

While the association, through its crop contract, is empowered to handle and sell the dried pears of its members, we did not see our way to do so this last yaer. Final organization was not effected until June, and in the limited time before crops moved it was thought best to concentrate efforts on one project alone, the sale of cannery pears. During th coming year, however, we will be in a position to secure for every member the full market value of his dried pears, if the members so desire.

The outlook for dried pears is better than ever before in the history of the industry. Shipments to European countries, which in the past have used the bulk of our pears, have been impossible. As a result, the crop has been consumed in America, and many consumers for the first time have learned that dried pears are a palatable and nutritious food.

During the coming year we shall have not only the United States as a market, with its newly taught consumers, but we shall get back our former customers in Europe. It seems reasonable to expect a most material increase in demand, at fair prices. The association, during the coming season expects to do considerable missionary work in bringing about better methods of drying pears, and later on a bulletin will be issued on the subject. There are too many low grade, off color pears on the market. Ten years from now the dried pear, instead of a side issue, should become a great staple, and should utilize a considerable portion of the entire crop of the state.

During the year the relations of the association with the various canneries to whom we have sold your product have been friendly and harmonious. We have used every effort to deliver fruit up to the contract standards. Unless we maintain careful methods of picking and sorting our fruit and making absolutely honest deliveries, we cannot expect to succeed. I am pleased to report that there were very few complaints by canners. The great majority of growers made deliveries which were above question. This is most creditable, for with the great labor shortage, it was almost impossible to hire skilled pickers. There were only a half dozen instances of poor deliveries, and these cases were promptly and fairly adjusted by the association, the canner and the grower.

A business of nearly $400,000 has been handled without the loss of one cent in bad accounts. The growers have received their money with greater promptness than ever before in the history of the industry, although it was difficult at times for the canners to finance themselves, owing to the unusual ruling of the government in commandeering nearly half the output, with payment only in sight at some distant time in the future.

While we have a growing membership roll, we need, for the fullest success, the membership and cooperation of every pear grower in California.

Each member who induces his neighbor to sign is adding to the value of his own and his neighbor's orchard. He helps reduce the overhead expense of the association and his own proportion. He is saving the expense of paid solicitors. Write to us for blanks, and cooperate by adding your neighbor's cooperation to the efforts and work of all the growers.

There are now about 17,000 acres of pears in bearing. Within ten years there will be in all likelihood at least 47,000 acres in bearing. This will mean finding markets, not merely for the present 80,000 tons, but for nearly three times that quantity. It can be done, but only through concerted effort, year by year, if disaster is to be avoided. Without adequate and complete organization a slump in prices will some day take us unawares. With adequate organization present markets can be broadened and foreign markets built up, and the industry kept on a sound and satisfactory basis.

If we continue the policy of reasonable prices to manufacturer and consumer, high quality of product, fair dealing with customers, extension of markets for canned and dried pears, and collective efforts for the general good of the industry, we may be sure of maintaining a great industry on a sound and satisfactory basis.

OUR ADVERTISERS RELIABLE

We guarantee our subscribers against loss through dishonesty of any advertisers in the Cultivator. We do not attempt, however, to adjust trifling differences between subscribers and honest, responsible advertisers, nor will we pay the debts of honest bankrupts. Notice of complaint must be sent us within 30 days from date of the transaction, and the subscriber must have mentioned the Cultivator when writing the advertiser.

THIS WEEK'S COVER

A bit of the Salt River Valley of Arizona is in full view on this week's cover. Heads of lettuce—acres of it—ready for the market, and all these acres of intensive cultivation of land which would be desert were it not for the great Roosevelt dam. The reclamation service has made some mistakes but these reclaimed lands have meant much in feeding the world during the past three or four years.

More specific information regarding these lettuce crops may be had in Mr. Bemis's article on the fifth page of this issue.

INCOME RETURNS

The internal revenue collector sends information that new return blanks for 1918 reports will soon be ready.

GET ACTION

Something seems to be wrong with transportation. The flour mills with supplies worked up and ready for the market are compelled to stop until these supplies can be moved from their warehouses. Manufacturers of other food products are meeting the same situation. Yet we are told the world is hungry, and we are told truly. The ship building program has been but little slowed down; some vessels which were in German ports during the war have been taken by the Allies and pressed into service; destruction by submarines has ceased; and we are all inquiring, "Why don't things move more swiftly?"

Wheat, cotton and hogs have been taken in hand and, so far as consumers and producers are concerned, a fairly satisfactory condition prevails, but the producers of other foodstuffs are anxious as to disposal of crops already produced.

SIT TIGHT

The lima bean growers' association has adopted for its slogan, "We will sit tight and carry them over until next season." The bean growers feel that there is nothing to be gained by endeavoring to force the market, and so the local warehouses, stacked to the roof with beans, will continue to house them until the next crop is ready to be sold.

Since writing the above, the communication of Mr. Serres which appears on page 142 of this issue has been received. He makes a statement so clean cut that we call attention of our readers to it.

We are also reminded that in the issue of the Cultivator of December 28 we referred to the report that the lima bean growers were able to sell for government use provided commission payment was made to a certain broker. This was commented on by the San Francisco Chronicle and the suggestion made that under such a condition there was need for government investigation. The grower is not asking for the government to give a fictitious value to his products and force the consumer to pay more than is just, but he is anxious to secure just returns for his labor. But, instead of securing these just returns, when he is promoted by the middleman and, worse, when the middlemen is permitted to import from those countries where the cheapest labor conditions in the world prevail in order to break his market, he is justified in making a most emphatic protest.

RELEASE THE FARM BOYS

Every magazine and every other form of publicity service is bringing before the people the question of what to do with the returned soldier without a job. While this discussion is going on many a California farmer is appealing for the return of his boy to the farm to aid in the production of next year's crops.

We realize that there are many turns and twists in the problems of the present reconstruction period. American soldiers are scattered pretty well over the world, from Archangel to the Philippines, and to return a California boy who may be today on guard somewhere on the Rhine is an impossibility, while other boys from the cantonments in America may be turned loose and become a problem themselves instead of helping to solve the labor problem.

The trouble is with making suggestions that we are very liable to make them from our own standpoint rather than from the standpoint of those who have the real problems on hand and whose difficulties are many. But as a mere suggestion to the powers that be in Washington, especially the army and navy departments: "Turn the farm boys loose first if more food is needed."

We note a Nebraska dispatch says: "Governor Samuel R. McKelvie left Lincoln today for Washington to request the war department to have farm laborers discharged from military service in time to permit them to do spring work on farms."

HONOR THE FLAG

The war is over. Our patriotism remains, as do also some unfortunate manifestations of our patriotism, such as the tattered and soiled flags on autos, and too often on a flag pole in front of the home. They are no honor to our country nor to the one who is responsible for their display. Brighten up with a new flag or else have it removed decently and in order.

SURPLUS WAR SUPPLIES

The war department now has a job on its hands in the disposal of a vast surplus of war supplies. After making deductions for the needs of an army of occupation and for cantonments used as demobilizing stations there still remain unnumbered tons to be disposed of. Uncle Sam planned large and bought large. For instance, in this surplus which will now be placed on the market there are 70,000,000 cans of tomatoes, 32,000,000 cans of corn, 36,000,000 yards of duck, 16,000,000 pairs of shoes, 5,000,000 hats, 6,000,000 mittens, 40,000,000 undershirts, 10,000,000 horse shoes, 2,000,000 tooth brushes, etc., etc.

At first thought it was proposed to slaughter the prices, throw these goods on the market and force immediate sale, but finally the entire matter was placed in the hands of a Surplus Stock Board to maintain prices and prevent a slump by securing gradual disposal of this great mass of supplies. For example, take the case of sulphur: Sulphur aggregating 60,000 tons will be passed back to the trade and through the trade into the regular channels of business. The trade has aided in solving the problem by offering to sell one ton of government sulphur for every ton it sells of its own.

While it is possible this may prevent producers from securing some supplies at low prices it may also prevent a slump in prices of products which they have for sale.

In any case, a whole lot of thought is being given to reconstruction.

LEAGUE OF NATIONS

There will still be many a debate in which self interest of the various nations will be manifest, and some time will elapse before the League of Nations will become a fact. However, so far as news is allowed to the public, such steps as have already been taken are very favorable to the formation of the league which the majority of civilized peoples believe means less war and, we hope, its abolition.

The League of Nations, which was organized in Independence Hall, Philadelphia, June 17, 1915, has had no small part in bringing out public sentiment in favor of the league plan, and there are those who feel that its president, ex-President Taft, should have been a delegate to the Paris conference. However, as has often been said regarding American action in the war or the action of any nation for that matter, real accomplishment depends upon the intelligence and integrity and determination of the mass of the people far behind the fighting lines. In regard to this league of nations the great mass of the American nation have hoped that other nations might appreciate the possibilities of such a league, and at the same time feared that self interest might so complicate the situation that the effort would fail.

While the league appreciates this attitude it still realizes the fact that more explicit information must be had in order to accomplish the most for this league. To that end it is calling for a congress at which the great questions involved may be discussed before the people. This congress has been divided into nine sections. The first, the Atlantic congress, is to be held in New York City, February 5 and 6; the New England congress at Boston, February 7 and 8; other congresses at Chicago, Minneapolis, Salt Lake City, St. Louis and Atlanta; the Northwestern congress at Portland, February 16 and 17; and the Pacific Coast congress at San Francisco, February 19 and 20.

These congresses will be addressed by the Hon. Wm. H. Taft, Hon. Jas. W. Gerard, Dr. A. Lawrence Lowell, Philip North Moore, Hon. Henry Van Dyke and Hon. Frank P. Walsh. Ambassador Gerard is definitely programmed for the Atlantic Coast congresses, but it is yet uncertain whether he will attend those on the Pacific Coast.

One feature of interest to Cultivator readers is the appointment of a special committee having to do with agricultural problems, for it is realized that in the discussions which will lead up to the formation of this League of Nations agricultural concerns must be looked after; further, that the fullest support of those same agricultural interests must be had for the fullest accomplishment of the League's purposes. The committee arranging these congresses writes:

In an hour when the creation of a league is the principal subject for discussion throughout the world, the society that was the pioneer in bringing forward the project of a league owes to the unconvinced an explanation of what is proposed and to believers in a league a plan of action by which they may help to secure one that will succeed and endure. Such is the double purpose of this national congress in nine sections to which the recipient of this program is invited.

Vine Pruning Demonstration at La Canyada

HOW to prune grape vines is one long question. There are perhaps nearly as many methods as pruners. This fact was developed at a vine pruning demonstration under the direction of the Los Angeles County farm bureau by Prof. F. T. Bioletti on the White Ranch at La Canyada. Mr. White has a vineyard of Cornichons, Flame Tokays and other table grapes. The varieties used in the demonstration were those which give best crops when pruned short or according to the old California method with most of the table and raisin varieties. Prof. Bioletti was most interesting and instructive in his general discussion of the principles of pruning and even more so in the practical work done before the class which stood about the vineyard observing his method of work.

Prof. Bioletti at La Canyada Vine Pruning

With the saw and pruning shears in hand and vine ready for the pruning operation the most practical demonstration was made. Owing to shortage of funds in the state university the expense of this demonstration was borne by the farm bureau of this county of which Dr. Coit is farm adviser.

He had not talked long, however, about the method of pruning Tokays until he came in contact with those who believe otherwise. Prof. Bioletti does not believe in summer pruning. He stated emphatically that tests in practical vineyard work made by the University of California under most careful observation showed great loss of vitality to vines where summer pruning was persistently followed. Summer pruning is done to secure new growth and young leaves over the top of the vine to make up for the loss of protection from the sunshine by the continual drooping of the long growing vines. This dropping away of the leaf as the vine falls over leaves some of the more attractive bunches of grapes exposed to the sun. This, especially in non-irrigated vineyards, results in scalded fruit and severe loss to the producer. Another reason for summer pruning is to remove the excessive lateral growth of some branches which take an undue portion of the sap and stop cultivation earlier in the season than the vineyardist desires. Hence vigorous sickle pruning is followed by some. It appeared from the questions asked at the La Canyada demonstration that the greater number present believed in summer pruning under conditions prevailing in that section.

Prof. Bioletti did say that if summer pruning was necessary it should only be done with the thumb nail, that is, the growth when it's out 18 inches or two feet may have the tender tip pinched off. This only delays growth for a very few days and is reasonably sure to result in the sending out of a number of laterals instead of the one terminal bud taking all the strength of the vine. These lateral branches hold the weight of the branch growth back nearer the center, making a wealth of young growth on the top which aids in shading and protecting the young growing fruit. But the highest vigor and most liberal crops given continuously can only be secured by encouraging all leaf and vine growth possible. Continually suppressing this vigorous growth not only results in crop loss but vine loss.

New Standardization Law

A meeting was held in the office of the state commissioner of horticulture, January 17 and 18, to discuss changes in the horticultural laws and the revision of the standardization laws. Representatives of all the large fruit interests were present, as well as the legislative committee of the State Association of Nurserymen, the legislatice committee of the County Horticultural Commissioners, and the State Association of Supervisors.

The committee endorsed the changes suggested by the state commissioner of horticulture to the state and county commissioner law, which will enable the state commissioner to get greater uniformity in action between the different counties. The standardization law was discussed at some length and many changes were recommended which will greatly benefit the horticultural interests of the state.

A committee on orange standardization, represented by W. E. Sprott as chairman, suggested the placing of orange standardization in a paragraph by itself and the increasing of the requirements of maturity of oranges by the addition of 40 per cent color to the eight to one before oranges could be considered mature for shipment.

George W. Ashley reported on the question of the advisability of the state commissioner of horticulture establishing grades and grading rules for certain fruits and vegetables, which might need grading, such as potatoes, onions and any fruits which are not at the present time standardized. The meeting advised the addition of such a paragraph to the standardization law with the proviso that before any such grades and grading rules are established a meeting should be held attended by at least 50 per cent of the industries affected.

W. D. Bennett, chairman of the committee on standard containers, made recommendations covering the standards for berry baskets, apricots and plum baskets, peach, apple and pear boxes, and standard and cherry lug boxes. The question of uniform containers is a very important one and was discussed at some length. It was decided that any other sized containers could be used but they must be marked in letters not less than one-half inch high "Irregular containers". There was a discussion of the standard apple act, and it was finally decided to refer this matter to a committee headed by J. E. Gardner of Watsonville.

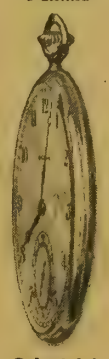
A resolution was also introduced drawing attention to the Lever Bill, now before the congress of the United States, recommending the secretary of agriculture to establish grades for horticultural and agricultural products throughout the United States. It was pointed out that such a bill would undoubtedly be a great handicap to California, and the committee recommended that the state commissioner of horticulture be present in Washington, to represent the California agricultural interests when the bill comes up for hearing.

The Pure Seed Bill, introduced by Senator Rigdon and now to be known as Senate Bill No. 10, was read and endorsed.

WALTHAM THE SCIENTIFICALLY BUILT WATCH AND THE FOREIGN BUILT WATCH

THE watch presents the same elements of mystery that once surrounded the automobile. Now, nearly every one knows something about a motor car's mechanism. It is to make the "works" of the watch an "open book" that these Waltham advertisements are designed—to instruct and protect you in buying a watch.

The mainspring is the power of a watch. It is a piece of specially hardened and tempered steel, about twenty inches long, coiled in a barrel between the upper and lower plates of the movement.



It is subjected to varying conditions of service in temperature and tension. The variation in thickness of two one-thousandths of an inch, of lack of uniformity in hardening and tempering, will decide the time-keeping quality of your watch.

The Waltham Watch Company produces fourteen tons of mainsprings every year. It is the largest mainspring maker in the world. The Waltham mainspring is cut from long rolls of steel of uniform and special quality, then tempered *in resilient form* by a secret process, and is placed in the watch coiled into a hardened and tempered steel barrel. This is exclusively a Waltham practice.

The *foreign* mainspring is not only cut *in short lengths*, but hardened and tempered *in short lengths*—therefore every foreign mainspring is an individual spring of uncertain temper, making the watch a liability.

The foreign maker of watch movements buys his springs in the open market. That is one reason why the imported watch gives such varying service. An inferior mainspring means an inferior watch—no matter how much you pay for it.

Pendant and Bow Patented

Colonial A

Extremely thin at no sacrifice of accuracy. 21 and 19 jewels

$125 to $240 or more

depending upon the case

The uniform superiority of the Waltham mainspring is one of the reasons why the horological experts of the leading nations of five continents chose Waltham in preference to watches of any other make.

Absolutely Reliable Nursery Stock

is what the practical planter wants. He cannot afford to take chances, but must have trees that are free from all disease, are well rooted, and propagated only from bearing trees. Our stock is grown in San Benito County, in a climate which permits a thorough ripening of wood, and in a soil which encourages a fine root system. We have our own bearing orchards of over 60 acres from which to select buds, and test varieties. Our nurseries were first started in Napa County in 1878.

Almonds, Apricots, Prunes, Pears, still in good supply

Also Remember

That nothing adds more to the value of a piece of land than suitable planting of

Ornamental Shrubs and Trees

of which we have an immense stock. Landscape gardeners and the owners of country homes should make a note of this.

Buy Fertilizer

The question often comes to us as to whether it is better to buy fertilizer at present prices or to let the trees take a partial rest and wait for lower priced fertilizers or manures. By this inquiry we are reminded of a remark heard at a farmers' institute when a farmer was asked how he could afford to put so much money into fertilizer, and Yankee-like he came back with "How can I afford not to?" Taxes, interest, irrigation, cultivation, and other overhead expenses go on regardless of production, but unfortunately production does not go on regardless of fertility or proper soil conditions. Hence we would keep up soil fertility regardless of present day quotations, though these times do cause twisting and turning to get that which will secure the greatest return for the lowest possible expenditure. Whether this might be through the application of stable manure, commercial fertilizers, baled hay or green manure we are not prepared to fully advise. There seems to be hopeless diversity of opinion as to this matter of soil fertility and unfortunately scientific observers sometimes fail in giving definite and consistent instructions. But regardless of any uncertainty there must be no uncertainty in the matter of maintaining a supply of vegetable matter in the soil. This may be secured in the form of green manure crops which may be increased by the use of commercial fertilizer. As to waiting till the price of commercial fertilizers come down, the wait might be too long for the best interest of the orchard. In the matter of nitrates alone the government demand for this material in the manufacture of explosives has cleaned up the market and shipping is not yet sufficient to promise any early deliveries. Local supplies of blood, cotton seed, tankage, or packing house refuse, fish meal and other organic supplies are too limited to be of great moment. We have asked a dealer as to the future and he writes:

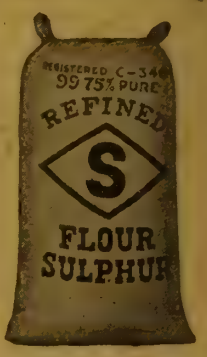
"The writer's idea is to have the users of fertilizer look into this matter in the proper light and see whether they think it is to their advantage to put off their purchases until later, with the idea that there will be a slump in prices and that they may be able to procure their wants later on for less money. The writer has investigated very carefully the amount of supply there is in sight and under ordinary circumstances there will not be enough to anywhere near go around and the inevitable result is that supply and demand fix the price."

Solves a Walnut Worm Problem

D. B. Mackie, field deputy of the state commission of horticulture, now at Los Angeles, has solved one of the most perplexing questions relating to codling moth elimination in bags used to ship walnuts. He suggests the use of an electrically heated laundry mangle, the empty bags passing through not only being subjected to great pressure, but also are sufficiently heated to kill any living matter contained therein.

C. Thorpe of the California Walnut Growers Association says that the mangle machine has a decided advantage over other methods tried, as it turns out the bags in better condition than before treatment, whereas all other forms of treatment have left the sacks damaged and wet, later to mold. Mr. Thorp estimates the cost of mangle treatment to be about one-half cent a bag.

The value of Mr. Mackie's idea is great, as the codling moth situation is one of serious aspect to walnut growers. Mr. Thorpe suggests that every walnut packing house should be required to install one of these mangles, since the adoption of this method would prevent the spread of the worm from district to district, which is now possible through the medium of infested bags.



Rodent Control Work

The rodent control division of the state commission of horticulture announces the following itinerary for the month of February:

W. C. Jacobsen, superintendent of the division, and Field Assistant A. E. Gray will spend February 3-8 in Glenn County, 10-15 in Colusa, and 17-22 in Sutter County. Field Assistant L. S. Neville will spend February 3-15 in San Bernardino, 17-25 in Los Angeles County. Field Assistant J. N. French will devote the entire month of February to Sonoma County.

During their stay in the different counties, they can always be reached through the county horticultural commissioner's office, which will be their headquarters. Names of the county horticultural commissioners and their offices are given below: H. C. Wren, Glenn County, Chamber of Commerce, Willows; L. R. Boedefeld, Colusa County, Court House, Colusa; H. P. Stabler, Sutter County, Yuba City; Jno. P. Coy, San Bernardino County, Court House, San Bernardino; H. J. Ryan, Los Angeles, Hall of Records, Los Angeles; O. E. Bremner, Sonoma County, Court House, Santa Rosa.

Land owners whose properties are infested with rodents are urged to take advantage of the opportunity to get expert advice on control measures as the state representatives will be prepared to make demonstrations in the control of ground squirrels, gophers, field mice, etc.

SULPHUR

It has been proven and so recommended by the University of California that if you sulphur your grape vines and orchards SIX times they will not be affected by MILDEW or RED SPIDERS.

ANCHOR Brand Velvet Flowers of sulphur, also EAGLE Brand, Fleur de Soufre, packed in double sacks, are the fluffiest and PUREST sulphurs that money can buy; the best for vineyards; the best for bleaching purposes, LEAVING NO ASH.

Try our new brand of VENTILATED Sublimed Sulphur, 100 per cent pure, for making Paste — (Atomic Sulphur) — and for dusting.

For Lime Sulphur Solution, use our DIAMOND "S" BRAND refined Flour Sulphur. We can furnish you this sulphur at such a low price that it will pay you to mix your own solution.

To create additional available plant food, drill into the soil 100 to 400 pounds per acre of our Diamond "S" Brand Powdered Sulphur. Write direct to

San Francisco Sulphur Co.

624 California Street, San Francisco, Cal.

We are equipped to make immediate shipment. Send for illustrated booklet; price list and samples, and please state for what purpose you use the sulphur, quantity needed, and date of shipment preferred. Tel. Kearny 871.

OVER 40,000 CARS

According to the estimate made by the Riverside Press Southern California will send out during the coming season 31,000 cars of oranges and 7000 cars of lemons; Central California, 3200 cars of oranges, 300 cars of lemons; Northern California, 250 cars oranges, or a total of citrus fruits for the state of 41,750 cars. The fruit is distributed by districts according to the table of the Press as follows:

	Oranges.	Lemons.
Pomona district	4500	335
Ontario district	3000	750
Ausza-Glendora dist.	3000	200
Riverside district	2850	300
Redlands district	2800	.....
Orange district	1900	450
Covina	1500	.....
Anaheim	1400	20
San Dimas district	1200	600
Rialto district	1150	90
Whittier district	1000	800
Placentia	1200	20
Highland	1000	125
Ventura County	800	1000
San Diego County	225	650
Fullerton	700	40
Duarte-Monrovia	700	.....
Corona	400	400
San Fernando	400	400
Alhambra district	500	.....
Santa Barbara County	.....	500
Moreno	170	.....
Hemet	125	20
Other localities	480	300

This data was gathered long enough after the frost to make fairly accurate work possible. But it is never possible to judge the amount of frost injury until the fruit is really harvested. Another influence which may take off from the estimate is the windstorm which prevailed about a week after the above figures were made up.

BETTER FRUIT BY BUD SELECTION

Two experimental lemon groves were established in the past year by the United States department of agriculture in California, where special attention will be given to the development of better fruit growing strains through bud selection. One of the plantings is located near Corona and consists of 11½ acres; the other is at the citrus experiment station of the University of California and consists of five acres. Both of these experimental orchards were planted with progeny trees propagated from selected parent trees having the best production records. For comparison with trees so propagated other trees propagated from parent trees having inferior performance records have been planted. The plan is to keep accurate records of all trees for a series of years after they come into bearing. From a commercial standpoint the bud selection work conducted by the United States department of agriculture has made great progress in California. As a result, the California Fruit Growers' Exchange established a bud selection department, the object being to supply to growers and nurserymen reliable buds of superior strains of citrus varieties grown in California.

Book Review

MANUAL OF GARDEN INSECTS

"Manual of Vegetable Garden Insects" by Cyrus R. Crosby and Mortimer D. Leonard of the New York state college of agriculture, published by Macmillan Company, 66 Fifth Avenue, New York, at $2.00. This is one of the Rural Manuals published by the Macmillan's and is a practical account of the principal insects which attack truck and vegetable crops, including cabbage, cauliflower, cucumbers and melons, asparagus, potatoes, tomatoes, celery and parsnips, lettuce, peas, beans, beets, spinach, sweet potatoes and sweet corn. The life history and habits of each are given, its injuries described and methods of control discussed. A chapter on insecticides gives an account of the more important materials now employed, with directions for their preparation and use. There are 19 chapters required to fill its nearly 400 pages. It touches upon insects in relation to their hosts or the crops which they infest.

GRIM REMINDERS

Press Officer Parks, stationed in Paris, tells of a recent visit to London while on furlough and of his astonishment at finding nail brushes fastened to the walls above the washstands.

"Is it possible," he exclaimed, "that members steal the nail brushes and you have to nail them to the walls for safety's sake?"

"Oh, no," said the host, and he smiled sadly, "our members are honest enough, but many of them have only one arm. We nail our brushes on the wall so that our many one-armed members can use them."

Farms and employment for returned soldiers are being planned for now by Secretary of the Interior Lane. Congress has granted him a fund of $200,000 to investigate drainage and reclamation projects.

Anyone keeping bees should know how to take care of them, because if you neglect your bees you are likely to injure the bees of your neighbor by allowing foul brood and other diseases to be scattered throughout the community.

A buzz saw can teach an inquisitive man more in a minute than the best instructors can teach him in a lifetime.

The foolish man "darns" his luck, the wise man "mends" it.

Twice The Work-Half The Expense

MOLINE UNIVERSAL TRACTOR

"One man and a Moline-Universal Tractor will do about the same work (taking a season through) as two men with four horse teams."— *Crumbaugh Bros., Vandalia, Illinois.*

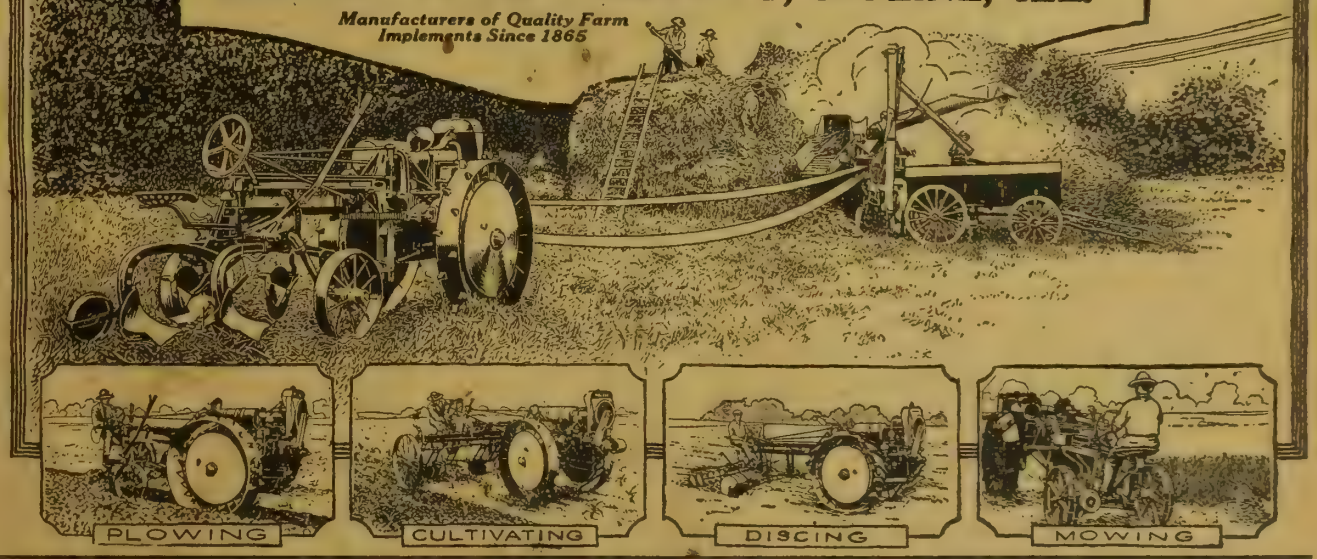
Statements such as this from Moline-Universal owners—and we have many of them—support our claim that the Moline-Universal enables one man to do twice as much work at about half the expense as is possible with horses.

With a Moline-Universal you can plow 9 acres a day, double disc 27 acres, drill 35 acres, cultivate 15 to 20 acres, mow 25 to 35 acres, and harvest 30 to 35 acres. Figure out for yourself how long this would take you with horses. Then keep in mind that in case of necessity you can work night as well as day, because the Moline-Universal has complete electrical equipment, including electric lights and self-starter.

As for expense it runs about half what the same work with horses would cost.

Charles J. Deck of McArthur, N. D., says: "I plowed 60 acres—fuel amounted to $32.94. It would have cost me $82.40 to plow this with 6 horses, not figuring feed for Sunday, or rainy days. I did not have to get up at 5 o'clock every morning either." Mr. Beck did not consider the saving of his own time.

"If I hadn't had the Moline-Universal I would have kept 4 more horses, which are a bigger expense than the tractor," says J. E. Carey of Wilmington, Ohio.



Many other statements similar to this prove that the cost of operating a Moline-Universal Tractor is no greater than maintaining three or four horses, while it will do twice as much work. Then there is another big advantage—belt work. The Moline-Universal has enough power for all ordinary belt power requirements.

"I purchased a 20 x 36 separator and then threshed my grain, pulling it with the Moline Model D. The tractor handled this separator very easily and did fine work. After I had threshed my own grain, I threshed for four of my neighbors, about 350 acres in all."—G. C. Appenzeller, Bouton, Ia.

Considered from every angle the Moline-Universal is the best tractor for you. It does all farm work, including cultivating. One man operates both tractor and implement from the seat of the implement. It will make you money. See your Moline dealer now or write us for full information. Address Dept. 49.

TALKS ON

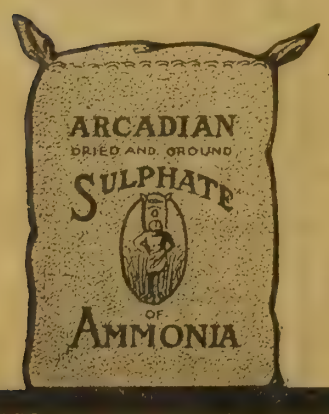
Nitrogenous Fertilization

Number 2

Why should you put ARCADIAN Sulphate of Ammonia on your wheat?

In the first place, because it is the duty of every farmer to raise larger and better crops.

In the second place, ARCADIAN, drilled or broadcasted at the proper time, will bring the needed increase.



University of California experiments show this. At Glendale, Los Angeles County, the Sulphate of Ammonia plot gave 2,114 pounds per acre, while without it the yield was only 822 pounds.

At Roberts Island, San Joaquin County, the yield from the Sulphate of Ammonia plot was 1,764 pounds, and the unfertilized plot only 947 pounds per acre.

Apply 100 pounds per acre early enough to have at least three inches of rainfall afterwards. In most localities in California this means before February 20th.

ARCADIAN
Sulphate of Ammonia

ARCADIAN Sulphate of Ammonia is the well-known standard article that has done you service in your mixed fertilizers for years past. Especially kiln-dried and ground to make it fine and dry. Ammonia 25¼ per cent. Made in the U.S.A.

For sale by Hawaiian Fertilizer Co., Ltd., San Francisco; Pacific Bone Coal and Fertilizer Co., San Francisco and Los Angeles; Pacific Guano & Fertilizer Co., San Francisco and Los Angeles.

This Month in the Vegetable Garden

Southern California

Written for California Cultivator By D. F. Reichard

NOW comes the time of the year when nearly every one has a desire to plant something, to make a garden, to set out trees or plants, to watch things grow. February is the great planting month for all vegetables except the tender stuff like beans, corn, peppers, tomatoes and cucumbers, squash and melons, which may also be planted in the warmer protected districts.

In starting the spring garden do not fail to first get the ground in good shape for the reception of seeds and plants. This is of paramount importance. Work the soil about a foot deep and pulverize it well. If you are working an open space use a team and plow and harrow; if your space is confined use a spading fork or shovel or a "Planet Jr." or an "Iron Age" with the plow attachment on. Always be sure to pulverize the ground before it dries out after breaking it up. If allowed to get dry there will be a lot of clods formed that will not break up all summer unless especially treated.

It is too late to turn under rough fertilizers where you wish to start stuff at once but in that part of the plot where stuff is not to be planted for six weeks or so coarse stuff may be turned under to good advantage. If fertilizing is necessary to the ground to be used at once apply a complete packing house or chemical fertilizer at the rate of 500 pounds to an acre. Once the land is put into shape weeds may be easily controlled by cultivating the whole patch, whether planted or not, after each rainstorm. This cultivating will also keep the mulched surface which is so desirable for retaining moisture.

In sections along the foothills where danger from frost is past Canadian and Ventura Wonder beans and Earliana tomato plants can be planted. In sections where there is still danger of frosts confine the planting to more hardy things such as beets, carrots, lettuce, onions, parsnips, parsley, turnips, cabbage, cauliflower and kale plants. Potatoes may be planted in all but the very cold low lands. The White Rose is the best potato plant in Southern California.

Set out all dormant fruit trees, berry bushes and plants and roots during this month for the best results.

Northern California

Written for California Cultivator By Albert R. Gould

WITH the growing season at hand, and lengthened days we must all get busy if we would have early crops. The danger of severe weather will soon be over, which will allow us to increase our planting list and considerably enlarge our area. It is necessary to point out here that to insure good yields and to avoid wasting good seed, time and money, manure to provide ample plant food is an essential. It is no use trying to grow a crop on "played out" soil. Every year that your garden or field plots are cropped, certain elements containing plant food are taken out of the soil by the crop, and these have to be put back again, and farmyard manure or some such fertilizer must be applied every season. You need rich soil to grow both quality and quantity. Water is also important. Study these problems carefully before you start in. With both these solved and experience gained by practice and the knowledge and hints from your "Cultivator" there is very little room for failure and there's no such thing as "luck" in this business. Nature works systematically.

In last month's notes we advised leaving some portions of the garden under preparation in the rough state to allow the air and frost to do their work. This should now be leveled and put into shape for sowing or transplanting. If the frames were made as advised and placed on the hot bed of manure and seeds sown these will be germinating and some early seedlings of lettuce, etc. will result.

Onions

The main crop of these should be showing up well this month but thinning out may be deferred as many of the seedlings will be large enough next month to use for transplanting to other beds which should be well prepared with manure this month. The soil should be well stirred between the lines of the growing crop. It should also be noted that the onion is a crop that responds to plenty of moisture and is a rich feeder. Onion sets or the small onion bulbs may be secured and planted in rows 12 to 18 inches apart.

Leeks

These also belong to the onion family and make an excellent vegetable used in soups, etc. They are not nearly so well known as they should be. They have a long season of growth and are also rich feeders. Trenches 12 to 18 inches deep should be prepared partly filled with manure. Seed should be sown in a box of sandy soil, placed in a warm situation, kept well watered and in a few weeks will be germinating.

Lettuce

White Paris Cos, Big Boston, May King, Los Angeles or your particular favorite variety should be sown during the month and successional sowings may be made from now on. Seed should be sown very thinly in rows 18 inches apart. This crop loves moisture and will always repay for being grown on a rich soil. Seedlings from this sowing should be ready for transplanting during the next month.

Turnips

On richly prepared ground a sowing of the varieties as mentioned last month may be made. Early Snowball is a good early variety and of very good quality.

Asparagus

Beds of this crop should be well manured and new beds planted with roots of Concover's Colossal, which can usually be secured from your seedsmen.

Beets

Sowings of Improved Globe and Early Detroit Dark Red may be made on rich soil. Sow in rows 18 inches apart. Swiss Chard or Sea Kale beet is a very useful vegetable and the greens are used as spinach.

Peas

A general sowing of Stratagem and Little Marvel may be made this month and the cultivator should be kept moving between the rows of the earlier sown varieties. Watch out for aphis or green fly this month, and if these pests are troublesome spray with Black Leaf 40.

Raspberries and Strawberries

Planting of these popular fruits should be completed this month and established plots should have manure applied liberally.

Central Californians are hoping for the early completion of plans for "Roosevelt Park" which it is hoped will contain about 1600 miles of the wonderful scenery of the Sierra-Nevadas in the Kings River section.

Peach Growers of California have made filings with the state water commission for waters from the middle fork of the Tuolumne River to use on lands for growing peaches.

The Grange at Aromas, San Benito County, recently held annual banquet and installed officers under direction of State Master F. L. Hunt of Napa.

Several farm advisers have been appointed distributers of nitrate of soda which will cost $81 f. o. b. San Francisco.

An Orchard is a Good Investment

Write today for this

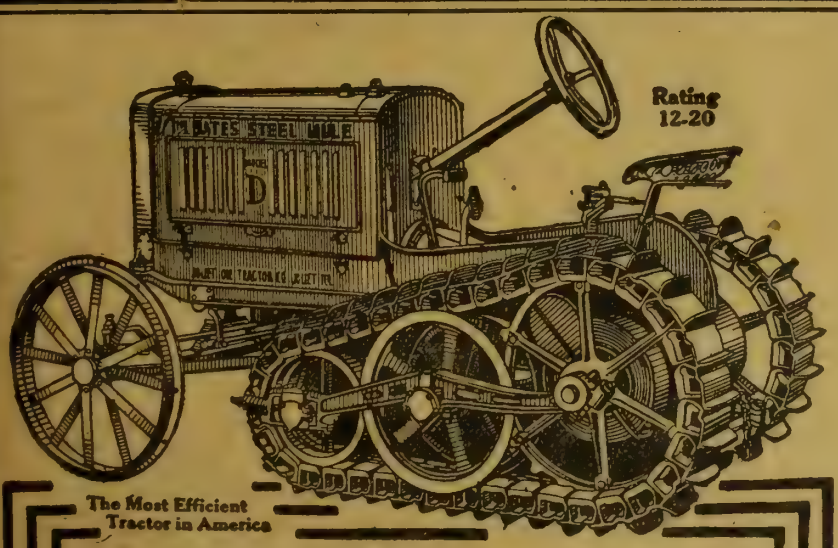
TREE Catalog

and learn how to plant and grow trees successfully

THIS BOOK answers in a satisfactory manner many questions which you may want to know, for instance if you are going to plant plums, what kind?

Early varieties of peaches bring good returns, but an assortment of peaches ripening from May to November is in many cases preferable.

While the Tilton Apricot is the canners' favorite, there are others equally good. Some trees grow and bear best in the warm interior valleys while others do better at a higher altitude along the foothills.



Growing almonds has become very profitable. Do you know whether your locality is suited to almond culture?

If you are in doubt as to what trees would do best on your land, write to us, describing as fully as possible all of the conditions, and we will be glad to advise you.

Send for Our Illustrated Catalogue and Price List. Contains 104 pages of real valuable information for fruit growers.—Free on request.

MORSE'S SEEDS

Bigger fruit crops are needed Use Planet Jr. tools

With Planet Jr tools you can do more thorough, more rapid cultivation, save time, labor and money, and get bigger and better crops because of their superior design and scientific construction. They last a lifetime. Fully guaranteed.

No. 41 Planet Jr Orchard Cultivator does such thorough work in orchard, vineyard or hopyard that bigger and better crops invariably follow. Exceptionally light draft adds to the ease of operation and rapidity of cultivation. The strong frame carries teeth, sweeps, irrigating steels, plows, alfalfa teeth and special weeders. Has tree-shield, side-hitch for low trees, and fore-carriage if wanted. Works deep or shallow, and cuts 4 to 6½ ft. wide.

No. 8 Planet Jr Horse-Hoe does a greater variety of work in corn, potatoes, and other crops requiring similar cultivation, and does it more thoroughly, than any other one-horse cultivator made. It is stronger, better made and finished. Lasts longer. Its depth regulator and extra long frame make it steady-running. Cultivates deep or shallow and different widths of rows.

72-page Catalog, free!

Illustrates Planet Jrs doing actual farm and garden work, and describes over 55 different tools, including Seeders, Wheel-Hoes, Horse-Hoes, Harrows, Orchard-, Beet- and Pivot-Wheel Riding Cultivators. Write postal for it today!

Making Farm Income Tax Returns

THE big income tax drive of 1919 is now under way and every preparation is being made to handle the largest collection in the history of income tax. "I am not waiting for the final passage of the new revenue bill by congress," said Collector Carter, "nor for the new regulations and blank forms to be issued. To get this big tax in and get it accurate and complete, I urge that we all begin now."

The income tax obligations imposed by the old laws, as well as the measure now in congress, consist of two distinct operations. One is to file return or statement of all items of income and items of deductions allowable by law, and to do this within the period named in the law. The other is to pay the tax, if any is due.

"Neither of these obligations can be met without a careful review of income and expenditure for the tax year That is the big job right now, and that is why the income tax drive is already under way. Everywhere the pencil is busy. The old year is done; all its fruits are gleaned; and every person who fared well, or earned a good competence, must analyze his own case in cold figures.

"When the new bill is enacted into law proper return forms will be distributed throughout the district and everybody will be informed of the date when the sworn return must be filed. Deputies will be sent out to central locations to travel through the district, aiding taxpayers in the preparation of the returns and in deciding doubtful points. We will go right to the people with the income tax and with the cooperation which the public can give the government men, the returns will be filed by everybody who comes under the law's provisions, the right taxes will be paid, and the district will have done its full patriotic duty toward the government's support.

"Meanwhile there is no need of delaying the preparation of figures. Anything that congress does now will not affect the amount of a person's earnings for 1918. Let us avoid the belated throwing together of figures that may hit or miss. Guesses cannot be accepted as the basis of taxation. It is clearly the duty of every person to compile correct figures and ascertain whether his income for 1918 was sufficient to make a sworn return.

"A farmer must figure up all income derived from the sale or exchange of products during the year, whether such produce was raised on the farm or purchased and resold. He is allowed to deduct from this total his expenses of the year connected with the planting, cultivation, harvesting and marketing of the crop, or the care, feeding and marketing of live stock.

"He is not allowed to deduct the amount expended in 1918 in purchasing stock for resale; but when such stock is sold its cost is to be deducted from sale price in ascertaining the gain to be included in his return of income. The cost price of stock bought prior to 1917 cannot be deducted as in the case just cited, if such cost was included in the deduction made in the year of purchase.

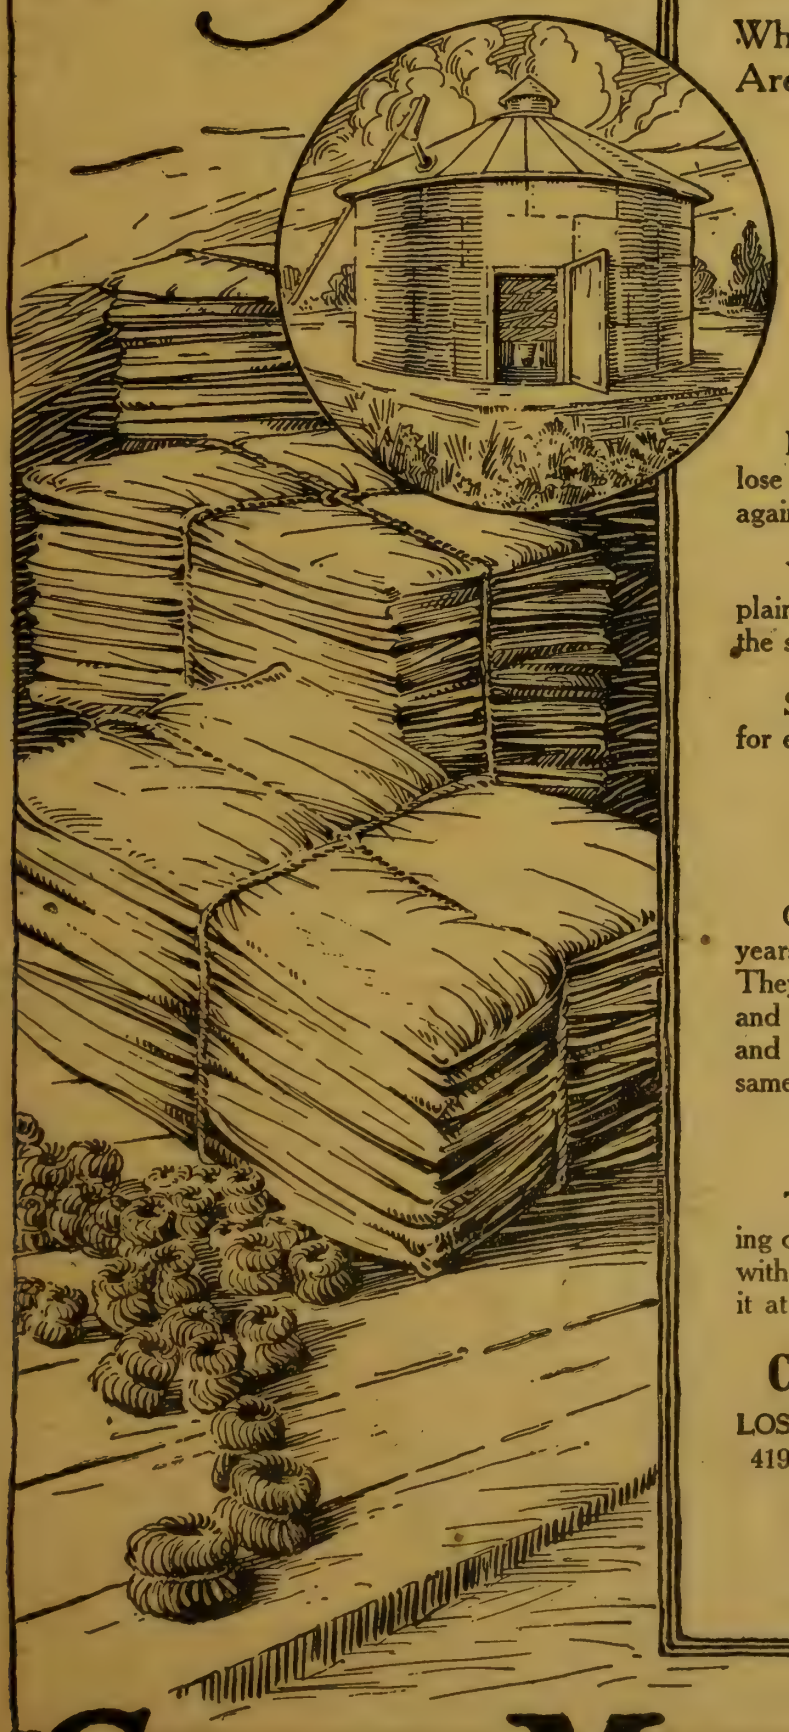
"The farmer is not required to include in his income tax computation the value of farm produce consumed by himself and family. But in cases where he exchanges produce for merchandise, groceries, etc., the market value of the articles received in exchange must be included.

"All other items of income arising during the year through personal service, business or trade, through use of property or money, should be added into the gains for 1918.

"Everybody wants to know what income is exempt from tax. Very few plums that fall to the average man may be legally disregarded in figuring up his 1918 income. Gifts and bequests can be eliminated; also proceeds of life insurance received by the beneficiary of any insured person. A person who cashed in an endowment policy need report as income only that portion which exceeds the total of the premiums he paid in all years on that policy. Annuities are not taxable, unless the person received in the year payment which represents, when added to all prior payments on the annuity, an amount greater than the original cost of the annuity. Dividends on unexpired life insurance policies are not taxable income; but dividends on paidup policies must be considered income. Alimony is not income to the recipient, nor is it an allowable deduction on the part of the person who pays.

"From the total of all items of income there are certain deductions allowable by law. All interest paid on personal indebtedness and all taxes paid during the year are deductible, except federal income and excess profits taxes, inheritance taxes and assessments for local improvements, such as sidewalks, sewers, etc. Losses incurred in business or trade are allowable, also losses arising from fires, storms, shipwreck or other casualty, or from theft, in cases where such losses are not compensated for by insurance or otherwise. Losses incurred outside of a person's regular business are allowable to the extent of gains reported from similar transactions within the year. Debts due to the taxpayer actually ascertained to be worthless during the year are deductible.

"Depreciation on property used in farming is another item that may be claimed as a deduction. The farmer may claim depreciation on his farm buildings, aside from his personal residence, also on his farm machinery, his work horses and farm work wagons. The theory of depreciation, in connection with the income tax, is that wear and tear caused by use in earning income is a real expense in the earning of that income. The rate is determined by the number of years that the property ordinarily would be useful, and the cost of the property is the basis of the computation. If the property suffering depreciation was bought or acquired prior to March 1, 1913, the market value as of that date is used, instead of the cost, in figuring depreciation.



"Contributions or gifts actually made in 1918 to organizations operating exclusively for religious, charitable, scientific or educational purposes, and to societies for the prevention of cruelty to children or animals, may be deducted, to an amount not exceeding 15 per cent of the net income computed without the benefit of this deduction.

"After the total of all income is found, and the deductions allowable by law have been computed as an offset, the amount of income in excess of such deductions is the net income, which forms the basis of the assessment of tax."

Dr. Dooley of Archie Road pithily remarked: "Ye kin lade a bye to college, but ye can't make 'im think."

Sacks

How many do *you need* next year?

YOU DON'T NEED a single sack for your next year's crop of grain. You don't need to hire a single sack sewer.

What about sacks—are they economical? Are they safe?

Vermin destroy sacked grain

If you leave sacked grain in the field you lose by rats, gophers, birds, bugs, rain and sun. You lose the grain—and in nine cases out of ten you lose the sacks, too. You usually have to re-sack the grain.

If you store your sacked grain in a warehouse, you lose by vermin, ants, mould, fire and theft. And here again about 40% of the grain must be re-sacked.

You lose a considerable quantity of grain just from plain carelessness in sack sewing—the string breaks, or the sack tears and out goes your grain. LOSS.

Sacks make other costs. There's twine, and wages for extra help.

You cannot get away from the fact that in using sacks you are suffering an actual and wholly unnecessary loss.

Calco Metal Grain Bins cost little—and last for years. They cut out the cost of sacks—completely. They absolutely eliminate costs of extra help and twine and sack sewers. Calco Bins pay for themselves quickly, and after that **they cost you nothing.** Sacks cost the same or more each year.

The Bean Situation

Written for California Cultivator By Anton Serres

LAST winter, after so many of our boys had enlisted and so many others had been drafted and were training in the camps to be sent across for the fight of Liberty, Food Administrator Hoover called on the farmers to produce the utmost amount of food stuffs to assist in feeding the armies and the civilian population of our Allies. The farmers responded to all calls and plied all energies to secure the largest yields their fields ever produced. The wheat farmers of the Eastern and Central states raised large crops of bread stuffs and the government guaranteed them well-paying prices. The bean farmers of California plowed up every knob and hill, every available spot, cultivated and worked the same with great care to prepare a good seed bed; they hoed and tended the growing vines, hired very expensive labor to assist them in the tedious work of harvesting and threshing and felt happy, when after all their toils, they could bring their crops to the warehouses.

But there lurked a foe, upon whom the open-hearted farmer had not counted, in the garb of the food, or rather bean speculator. The large firms had agents all over the country watching the output in beans; they had representatives in foreign countries who saw the enormous bean crops raised by the Japs in Manchuria. The heartless speculators secured large quantities of these beans, raised by cheap labor, and imported them, using them cold-bloodedly to ruin their fellow citizens who sacrificed their sons, their money, and their hard labors to win this war for the liberty of European nations, and in doing so became the slaves and victims of the stone-hearted capital of speculators. If the government saw fit to protect the wheat farmers by guaranteeing them a fair price for their wheat, why can't our senators and congressmen urge the protection of the bean farmers by asking the government to stop the importation of foreign beans and to set a fair price on the domestic output. Many of our most loyal citizens will be runied if the present state of affairs is not remedied. The writer has a small farm of 20 acres in a canyon near Arroyo Grande, and although he did not employ the high priced labor of Japs or Mexicans in the tending of his bean crop, his beans cost him over eight cents a pound in the warehouse, as shown by the following explanation. His farm cost him $4000. He had to pay $20 a ton for hay. He fertilizes one-quarter of his ranch every fourth year. He figures only $3.00 an acre for plowing, $2.00 an acre for hoeing, although the Japs asked $3.00 and $3.50, and $5.00 an acre for pulling, against $6.00 asked by Japs, and yet he finds the following statement of expenses:

Interest on $4000 @ 5 per cent	$ 200.00
Horse feed	215.00
Fertilizing five acres at $20	100.00
Plowing 20 acres at $3.00	60.00
Two spring tooth harrowings	40.00
Two harrowings	10.00
Flattening at 25c	5.00
Planting at $2.00	40.00
Harrowing	5.00
200 pounds of seed at 15c	30.00
Twice cultivating	40.00
Twice hoeing	80.00
Pulling, $5.00 an acre	100.00
Threshing 160 sacks at 50c, wages	80.00
Sacks—160 at 22½c	36.00
Twine	1.20
Hauling to warehouse	16.00
Storage at warehouse	30.00
Insurance	25.00
Depreciation	50.00
Total	$1163.20

The 160 sacks average 90 pounds, thus containing 144 hundredweights and cost the producer over eight cents a pound.

The writer has been an invalid for 13 years, nevertheless his eldest son was drafted and serves yet in the 13th Infantry. His youngest son worked most of the time with his team on the home ranch. If we take out the items charged for interest and actual work performed by the members of his family we have these amounts:

Interest, $200; plowing, $60; springtooth harrowing, $40; harrowing, $10; flattening, $5.00; planting, $40; harrowing, $5.00; cultivating, $40; hoeing, $80; pulling, $100; threshing, $80; hauling, $16. Total $676 for a family of four members to live on as their earnings and interest of farm derived from last year's crop, provided the beans can be sold over eight cents a pound. The only way, the writer sees out of this difficulty is to have every subscriber of the Cultivator cut out this article and send it to his representative and senator in congress, asking them to put a stop to this wholesale ruining of over a million of people on this Pacific Coast.

Questions and Answers

ANSWERS BY EDITOR AND STAFF

Questions to be answered in this department should be received at the office one week before reply is expected. Write plainly on one side of the paper and sign full name and address. Unsigned communications receive no attention.

Don't Plant Celery Too Early

I am having a good deal of trouble to get celery plants in a hot bed. They do not seem to sprout very evenly and when they get up about one-half inch they damp off badly. Some are about one and one-half inches high and have the first leaf but they are very slow in growth and very spindling. What is the proper time for planting seed for May celery? Does the seed do better in a cold frame than a hot bed?—Subscriber, San Diego.

We believe that you are trying to grow your celery too early. It is very hard to get it to grow well until about the middle of February. When celery is sown much earlier than that it acts just as you describe in your letter. We recommend a cold frame in preference to a hot one for starting celery, although when the seed is put out the middle of February or after it can be sown outside. To have mature celery for May or even June you would have to fertilize very heavily after plants have been set in the field about six to eight weeks.—D.F.R.

Canvas for Frost Protection

What is the benefit or detriment to fruit trees in covering with cloth during the frost seasons? That is, this to be used in preference to smudge pots.—Subscriber, San Francisco.

One of the first experiments in frost prevention was made near Arlington, Riverside County, nearly a score of years ago in covering an orchard, we believe 10 acres, with a lath house. We do not recall as to difference in temperature though we believe it was sufficient to prevent freezing in severe season, but we do recall that the

Protect Farm Buildings

ASK YOUR DEALER
Pioneer Paper Company Mfg's
LOS ANGELES

trees deprived of half of the sunlight refused to give out the necessary growth and the lath house was removed. Besides other objectionable features the cost proved a severe drain on the orchard profits. Some years later the Leffingwells at Whittier and the Chases at Corona made other extensive experiments in the use of tobacco cloth, covering some acres with quite expensive structure. These stood for a season or more but were ultimately destroyed by high winds. The covering of trees with a tent has been tried only by the use of fumigation tents with isolated or small number of trees. It is a success but hardly in the realm of economy. As to the lath house a fund of information may be had as to construction by noting columns of the Cultivator on page 257 of the issue of October 24, 1902. The tobacco cloth covering was fully illustrated and described on pages one and four of the California Cultivator of July 1, 1915.

Moisture Through Cement

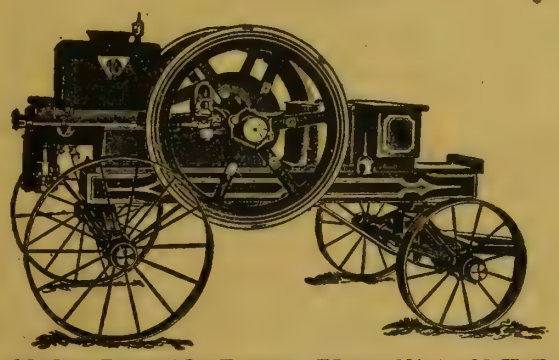
Since building a granary with a concrete floor, several people have told me that the grain will draw moisture through the cement from the ground and spoil the lower layer of grain. How can I put a smooth surface layer on the floor to make it easy to shovel up grain?—Subscriber, Oceanside.

Whether moisture will penetrate your concrete depends upon the richness of your mixture and the quality of your sand. If there should be any question it would perhaps be safer to put false bottom in or to float over with the rich mixture which is at least one-fourth of rather fine sand. Here is a hint from "Concrete on the Farm": "Sometimes the porous nature of concrete in tanks and cisterns due to improper protection while hardening, can be remedied by applying a coating of what is called 'waterglass'; this is chemically known as sodium silicate. The chemical is dissolved in water in the proportion of one part of silicate to three or four parts water, depending upon the porosity of the concrete to be treated. Two or three coats of this solution applied at intervals of 24 hours may be necessary to fill up the pores."

The top or finishing coat should be placed on the base as quickly as possible after the concrete is tamped in place. If the base is allowed to dry the top will not bond as well as when the base is fresh and still wet. The mixture for the top should be composed of one part Portland cement and one and one-half parts coarse sand, which is equivalent to one sack of cement to two and one-half cubic feet of sand. This mixture should be prepared in small quantities, mixed with sufficient water to make it spread easily, and should be placed as quickly as possible. Any of the mixture not used within 30 minutes after water is added must not be used for the top but may be put into the concrete for the base. The spreading may be done with the ordinary trowel or with a home made one which may be a surfaced piece of 2x6. It may also be an inch thick. On one side may be arranged a wooden handle which makes it possible to use it to trowel down and smooth the surface. Of course to work it to a true edge and even surface a straight edge is necessary before the final finishing. The final finish may be best secured by allowing a short interval before final smoothing but it must not be allowed to stand too long for it will then require excessive troweling and the right finish will not be secured. The wooden trowel gives a better surface than the steel tool.

THE WISCONSIN SALE

Manager F. H. Everson writes us that the next Wisconsin State Holstein Breeders' sale will be held at Fond du Lac, Wisconsin, March 12 and 13. These great Wisconsin sales are becoming historical events with the Holstein Friesian people.



The maximum price at which farmers may sell cattle for slaughter in Switzerland has been fixed at 23 cents per pound on the farm. Maximum prices for meats have also been established.

Principles are fine things, but a cheerful disposition is easier to live with.—Binghampton Press.

THE FIRST COMMERCIAL CROP OF PISTACHE GROWN IN CALIFORNIA

Written for California Cultivator
By Claud D. Tribble

OWING to a mix up on the part of those supplying the scions for our trees we did not have our male trees properly placed so had to pollinate our orchard by hand. This was done by cutting branches of flowers from the male trees when the first pollen began to escape and placing these on the wind side of the female trees to carry the pollen through the trees. This was done April 20 by one person. If it had been followed a few days later by more male branches our crop would have been greatly increased. One tree was not pollinated and although it was full of female flowers it did not produce a nut as it was so far away that the pollen from the others did not reach it. Mature nuts were secured early in September but the main crop was gathered September 20 and 21. We spread burlap sheets under the trees, then stripped the nuts from the stems and allowed them to fall on these sheets, when they were poured in to buckets then sacked to send them to the sheds.

The husking was more of a problem as the size of the nut made hand husking out of the question, so we took sheet iron and punched rows of holes in it, placed it in a frame, the rough side up and made a rubber of sheet iron, with holes made the same way, and nailed this to a handle. We poured the nuts into the frame about one and one-half inches deep and ran the rubber over them and then poured this out in boxes and picked the nuts from the husks. Those that were not husked were put through again. After husking, the nuts were placed on trays to dry. They were spread about two inches deep and stirred several times during the day. It took four days of good weather to dry them. A machine for husking can be made from wire mesh (⅝ by ¼ inches mesh). Make two drums, one to fit inside the other and to revolve in opposite directions, leaving a little space for the nuts to get through. By inclining this the nuts will come out clean and the husks drop through the mesh to the floor.

Some of our trees produced a few nuts in 1917 and in 1918 nearly all had a few nuts on them. The largest yield for one tree was 36 pounds of nuts in the husk. This made 21 pounds of nuts husked and 12½ pounds of dried nuts.

About 45 per cent of the nuts crack in the husk on the tree. These are kept separate and sold for salting in the shell. Those that do not crack are shelled by machinery and used in manufacturing candies, ice cream and coloring oil for candy and pastry purposes.

Home grown pictache nuts caused considerable interest among the importers, manufacturers and dealers. The United States department of agriculture took a portion of the crop for their investigations. Wherever samples were submitted they were pronounced equal in every respect to the imported nuts and the proportion of kernel to shell seems to be greater. Some to whom samples were sent pronounced them better than the imported varieties.

Those who make a business of shelling almonds and peanuts for manufacturing purposes say they can adjust their machines to crack or shell the pistache and G. P. Rixford says he was advised that when enough could

A Bit of History

The California Nursery Company of Niles is probably the oldest nursery in the State, being established in 1865. This nursery has been in active operation at Niles, California, since 1884. It is located on a tract of land comprising 465 acres, the soil being regarded as the cream of Alameda county. Time has established the fact that the late John Rock, who was the guiding spirit of this enterprise from the year of its inception until his death in 1904— having come here from Wayne, Santa Clara county, where he had been conducting the largest nursery in the State for a period of twenty years—acted wisely in selecting this favored spot. That this selection was a wise one has been fully demonstrated, for it is very rare indeed that it is possible for a nursery business to continue in one place for thirty-five years and succeed in growing successfully such an assortment of fruit and ornamental stocks—probably the largest and most complete in the United States.

The Apricot

The apricot is a native of Asia Minor and the higher regions of Central

ORNIA S. PAT. OFF. VARIETIES COMPA lites, Cal.

If you have land suitable for tree culture you can make it extremely profitable by planting trees.

Ornamental Trees will greatly enhance the value of your property.

Fruit trees are a continual source of revenue.

Whether the home be a small one or a mansion, there is nothing that will add more to its value than to have the grounds properly laid out to show it off to the best advantage.

We shall be glad to have you take advantage of

Our Landscape Department

We have unequaled facilities for planning and executing landscape effects for the modest home or the large estate, parks, factory and school grounds.

We wish to assure those who entrust their designing to us that we will give our personal attention to their particular problems. Our prices will always be found reasonable, consistent with good work.

We are recognized as specialists in the propagating of ornamentals. Our ornamental stock has largely contributed to the standing of our nursery in America as foremost in varieties and quantities.

For over half a century we have been collecting and developing plants from all over the world. More specimens of our production are to be found surrounding palatial California homes and in public grounds than have come probably from any single source.

Write for Cross-Section Blank

We have prepared a cross-section blank on which detailed directions are given as to the information we must have for the preparation of a sketch. This will be mailed promptly on application without charge.

Almonds

It is size ture. t of are op is their n no

The United States impports annually 9000 tons of almonds. Our annual production is 3000 tons. The only State in which almonds can be grown successfully is in California. In the last few years many new localities have been found adapted to almond culture. The quality of the nuts is exceptionally good, no matter where they are produced in California. It is a self-evident fact that, with our small production and our large importation, no one can make a mistake where conditions are favorable in planting almonds.

CEDRUS DEODARA

Indian Cedar. Thrives to perfection in California. A splendid tree for avenues or single specimens.

be had they could be shelled for three cents per pound. The manufacturers offer to shell amounts from 500 pounds up. Some firms advise us there will be no limit to the amount of these nuts they can use and at a good price. At present the shelled nuts are selling at wholesale at $1.25 per pound in San Francisco. The pistache will succeed on soil where other fruit and nut trees cannot thrive.

GARDEN TALK

By Ernest Braunton

For Cut Sprays

All who grow flowers in sufficient quantities to gather for house use like to have some light spray-like flowers that will look well mixed with roses, carnations, and other flowers of large size. Some grow stevia for this purpose and while it is showy it is not of spray-like growth and therefore too heavy for the purpose. Gypsophila or schizanthus are far preferable and doubtless are good as anything that could be found. Both may be grown from seeds sown at this time and will result in a good crop of flowering sprays for the whole summer.

House Palms

House palms are not difficult to care for or maintain in healthful condition for years. Food and water alone are required for palms do not thrive if roots are much disturbed. They should never be repotted unless absolutely necessary and this stage comes only when the pots are well filled with roots. These roots are few and therefore require little space and commercial dealers sometimes root-prune certain species in order to keep them in small pots. When repotting use but the next size larger in pots. Water them frequently by standing pot in a vessel or tub of water for a quarter-hour. During the growing season watering should be frequent and light doses of liquid manure, or a commercial fertilizer should be given. Keep the leaves washed free from dust so the pores will not be clogged. Potted palms grow very slowly.

A Favorite Pot Plant

Of all pot plants with palm-like foliage I do not know of another so easily grown as the aspidistra. The flowers are small, dull in color and rest on the soil among the leaf stems and so it is wholly a foliage plant and for that purpose has but few equals. Its needs are few—water well and keep leaves clean—a simple treatment. Like all plants it thrives best in good light (without sunshine however), but I do not know of another plant that so well stands darkness. The aspidistra will thrive in dark rooms, in bad air, for years if only occasionally given short spells of strong light. It belongs to the lily family and is native to China where it grows along the wet banks of shaded streams, ditches and in flowing water will thrive in full sunshine. In poor soil the leaves may become striped with white but in good soil they turn green again.

Spring Flowers

At any time during the next four weeks is a good time to sow all flowering annuals from alyssums clear through the alphabet to zinnias. There is no need of your being short of bright flowers, for a small amount spent for a variety of seeds will return a continuous crop throughout the summer. It is not well to buy these plants by the dozen when you may grow them by the hundreds at a lesser price. So many of them are hard to discourage after once they are up that it seems many would grow without the least care. More than that some will re-seed themselves and will always be with you. I still have portulaccas and poppies from seeds sown many years ago and can hardly keep the garden clear of them where they are not wanted.

DE LAVAL

The World's Greatest Cream Saver

All over the world creamerymen, big milk concerns, dairy authorities and cow owners who have special opportunity for judging the worth of cream separators have for years recognized the superior skimming and all-around efficiency of the De Laval.

That's why 98 per cent of the plants throughout the world separating large quantities of milk use the De Laval. It skims so much closer that they can't afford to use any other machine.

That's why 2,325,000 De Lavals are in daily use, more than all other makes combined.

Not only is the De Laval the greatest cream saver but it turns easier, is easier to wash, has larger capacity and greater durability than any other separator.

The more you know about cream separators the more certain you are to buy a De Laval.

The

Western Berkshire Congress Sale

To be Held at

University Farm, Davis, Cal.

Thursday, Feb. 20

The sale will consist of 50 bred sows and gilts and a limited number of boars and will be up to the high standard of former sales. This is your opportunity to secure a sow bred for early spring farrow. The consignments have been selected from the leading herds of California and represent the most advanced and approved type of Berkshires—the kind that will not fail to make money for you. Write either the president or secretary for catalog.

Dairy Cow Demonstration

"PLEASE, Mister, what makes the cow's nose always sweaty?" was one of the questions propounded to Assistant Farm Adviser Scribner of Los Angeles County at the recent dairy cow demonstration at the Elliott-Brant Rancho at Owensmouth. It was a poser, and the farm adviser quickly admitted that the little girl, like all the rest of the human race, had presented a question which tests the best talent connected with the state university. Mr. Scribner did conclude, however, and inform the little lady that if the cow's nose was not covered with tiny beads of moisture it was a sure indication of ill health. Like the dog, the cow must have a cool moist nose if in healthy condition.

Practical Dairy Lessons at a Practical Dairy

On the Elliott-Brant Rancho, January 23, inspection of the silos, the milking barn, separator house, the practical use of milking machines and some of the best dairy animals in the world, together with a talk by Assistant Farm Adviser Scribner, united to make a couple of hours of a summery mid-winter afternoon most instructive. Adviser Scribner, in shirt sleeves, with arms folded, is just calling attention to the essential points of the head of the herd.

This homely incident is referred to as indicating some of the practical work done in these farm bureau meetings. They are decidedly informal. In this case the gathering was in the corrals of one of California's finest dairies, in fact, the ranch which produced the milk which won the highest honors at the recent Liberty Fair in Los Angeles. The milk, which tested 98.5, was scored by C. M. Hoyt of the dairy division of the bureau of animal husbandry of the United States department of agriculture. This milk has been characterized as the highest scored milk ever produced, and every ounce of it was produced by pure bred Guernseys. These Guernseys were used in the demonstrations conducted by Mr. Scribner. First, the head of the herd was led in; also other bulls, both aged and youngsters. Next came calves, and finally aged cows. In each case Mr. Scribner, who is a dairyman of many years' experience and had the honor of exhibiting the world's champion butter producer at the St. Louis Exposition, drew attention to the principal points of the producers amongst the dairy cows.

After he had finished with the cows he made the further suggestion that after all was said and done the best of guns and munitions in the recent war were useless without the intelligence and bravery of the man behind. Equally so there was never a successful dairyman yet who was not efficient and alert to take advantage of every circumstance from feeds to market. The cow must be all right and give the dairyman a chance to do his part, but the real answer comes from the man behind.

After the dairy cow had had its innings the audience adjourned to the ranch of Creamer & Ireland, a couple of miles distant, and proceeded to judge and to discuss the points of Duroc-Jersey hogs. This discussion was in charge of Assistant Adviser G. E. Gordon.

Live Stock Notes from Nevada

The state live stock board, consisting of ex-Senator H. F. Dangberg, Minden; ex-Senator Thomas Bell, Nye County, and John H. Cazier, with Dr. Edward Records, state veterinary control officer, is working on a plan for tubercular control for Nevada. The plan is to ask for funds to pay for reactors which are killed out of state funds, together with an appropriation for the same by the federal government.

An agricultural society consisting of members of the three agricultural divisions of the university, the college of agriculture, agricultural extension and the agricultural experiment station, has been formed to promote better agricultural conditions throughout the state.

Squirrels and jack rabbits have become a great pest in the farming districts, notably in the eastern part of the state. This is no doubt due to the rapid and vigorous extermination of the coyote during the rabies control campaign during the past few years.

Thousands of sheep are grazing on the sage in northern Washoe and southern Nye and Esmeralda Counties.

Henry F. Alps, meterologist of the local weather bureau, has lately added a herd boar, Anchorage Leader, to his fine Berkshire herd. Mr. Alps is an enthusiastic city farmer who is making good on a small suburban farm.

Nevada is experiencing a rather open winter although the temperature has continued low since the middle of December. Some heavy snows have fallen in southern Elko County, however.

Hay fed steers are now starting to market. Owing to high prices for hay early in the season, a smaller number of steers are being fed this year.

Some small lots of hay are being offered in the Truckee-Carson project, near Fernley and Fallon.

Tony Faretto of Reno has lately purchased six high class Hampshire ewes of his neighbor J. J. Frey, also a Hampshire ram of the University of Nevada.

The University of Nevada has just obtained a Berkshire herd boar, Nordyke's Comet 2nd, from Joseph Wilson, Jr. of Yerington, Nevada.

George Wendt, manager for Longview Farm, Fallon, Nevada, has resigned to take a new position with the Hendersons of Sacramento.

John B. Matley of Reno reports the sale of a Percheron mare to W. H. Moffat, president of the Union Land and Cattle Company of Reno, for his Alamo Ranch.

The University of Nevada reports the sale of a Duroc-Jersey boar by Allright Boy to Evan McIntosh, Reno, the Dorset sheep breeder. Mr. McIntosh was formerly shepherd for the university.

Jack Cornthwaite of San Rafel, Cal-

fornia has lately taken the position of herdsman at the University of Nevada. It is to be noted that he takes particular care of his Shropshire sheep and Shire horses.

C. J. Lockwood of Reno has lately added a herd of Ayrshires to his well equipped farm on the Truckee Meadows. Mr. Lockwood is thinking seriously of adding a flock of pure bred sheep within the near future.

LIVE STOCK NOTES FROM ARIZONA

Arizona wool growers met in Phoenix January 11. The new wage scale demanded by shearers was accepted. Grazing fees on the national forests will be increased this season.

The executive committee of the Arizona Cattle Growers Association met January 13 to complete plans for the annual meeting to be held in Phoenix in February and also to consider matters that will come before the national meeting to be held in Denver.

Heavy snows are reported in the White Mountains and the coldest weather ever recorded there occurred January 2—25 degrees. It is expected that there will be some loss of cattle as the grass is all covered and snow is not melting. This is an evil that has its bright side for it will mean fine spring range with plenty of water, incidentally it means lots of water in the Roosevelt reservoir for the Salt River Valley.

The ranges in Pinal County are reported as rapidly getting in fine shape owing to three inches of rain which has fallen since December 1.

Mouldy silage has caused the death of several horses near Mesa.

The live stock sanitary board now has recorded 20,000 brands, and as many of these are believed to be unused at present it is proposed to have all brands re-recorded and a complete new system of cataloging will be installed which it is expected will simplify the work of the office.

Nineteen of the 75 inspectors of the state have been replaced with new appointees under the new administration. Other appointments are expected shortly.

POLANDS TO SELL AT HANFORD FEBRUARY 22

The next annual sale of Poland Chinas by the Kings County Poland China Association will be held at Hanford February 22.

Kings County furnishes a splendid example as to the possibility of community effort in live stock production.

From a small beginning a few years ago, this county has become the center of Poland China breeding interests on the coast. A few years ago a county association was formed and public sales were initiated. Each year has seen a marked increase in the number of herds maintained in the county and with each sale has come an increased interest in these annual events, until now the fall and spring sales are regarded as fixtures and the buying public has come to look forward to them as affording an opportunity to select breeding stock that represents the cream of Kings County herds.

This year's offering, it is stated, will be more attractive than usual. The year has noted an improvement in many of the herds. Much new blood has been brought into the county and the sale offering is being selected to measure up to the high standard set by former vendues.

TO REDUCE MILK PRODUCTION COSTS

Following a study of practical means to prevent the cost of milk production from rising to a point where dairying ceases to be profitable, the dairy division of the United States department of agriculture has found that four important factors have a direct bearing on the problem. By attention to these factors, all of which are within the control of producers, it was found that under Indiana conditions, which are typical of the area supplying whole milk to Chicago, the cost of production could be reduced considerably. The factors are raising the average production per cow, reducing the quantity of concentrated feed given low producing cows, substituting legume roughage for a part of the concentrates, and more careful handling of the manure. The importance of handling manure properly is secondary only to feed from the standpoint of net profits.

Live Stock News Notes

Celvian Buys Paicines Shorthorns

The herd of Shorthorn cattle maintained on the Paicines Ranch owned by A. King McCumber has been sold to Edward Celvian of San Francisco.

For a good many years this collection of cattle has been regarded very highly by breeders in the state. The blood line represented in the herd were among the best and while the herd has not been represented in the show rings recently it has been responsible for the distribution of some very desirable cattle. It will be recalled that the cow Glenbrook's Marvel, dam of California Favorite and California Marvel, was obtained by university farm from this herd.

Mr. Celvian, whose recent activities in live stock circles have attracted much attention, plans to handle his new herd on his large Kern County ranch.

Anderson Believes in Barrow Contest

Frank B. Anderson who is developing a herd of Berkshires on his ranch near Sacramento believes that a barrow contest such as will be held by the Western Berkshire Congress at the annual meeting at the University Farm, Davis, February 19 and 20, provides the best means of demonstrating the efficiency of any breed or herd, and because of this belief Mr. Anderson is fitting a pen of barrows for the show.

Anderson is a practical breeder who is raising hogs for profit and he is proceeding on the theory that inasmuch as the pork barrel is the ultimate end of a hog the farmer is chiefly interested in only the sort that will hang up a carcass at the least expense.

We are rather of the opinion that most of the swine breeders, regardless of the breed they may be handling, will find these barrow and carcass contests of valuable assistance in furthering their interests.

Guaranty Sale in March

The annual Guaranty Sale, the classic Holstein event, will be held in Sacramento some time in March, according to advices from C. L. Hughes, manager of Breeders' Sales and Pedigree Company.

The sale was originally scheduled for a December date, but owing to the high quality demanded by the backers, some difficulty was experienced in getting the necessary entries. Present indications point to a very attractive lot of consignments from a wide territory.

Milk Plant for Sacramento

The Northern California Milk Producers' Association has let the contract for the construction of a milk products plant that will represent an investment of $125,000. The plant will be located in Sacramento and will turn out butter, cheese, condensed milk and other milk by-products.

Carruthers Bull to Spencer Ranch

W. M. Carruthers, Shorthorn and Berkshire breeder of Live Oak, has sold the senior bull calf Live Oak Flash to the Spencer Ranch Company of Cranmore. Live Oak Flash was sired by Hallwood Flash and is out of a Queen of Beauty dam.

Cattlemen in Zone Four Meet

Members of the California Cattlemen's Association in zone four held their initial meeting at Fresno December 16 and elected the following officers and directors: J. W. Guiberson, Corcoran, chairman; A. C. Cranor, Fresno, secretary; A. S. Good, Bakersfield; Louis Frankenheimer, Stockton; L. A. Nares, Fresno; Stephen J. Pate, Le Grand.

A resolution was adopted opposing the extension of National Parks in California. A letter was sent the federal food administrator for California thanking him for his effective efforts in securing the opening of the national parks for grazing purposes.

Durocs in Good Demand

Clayton N. Slocum, junior member of H. P. Slocum & Sons, Duroc breeders of Willows, states that the demand for breeding stock has been keener the past few months than at any time since the herd was established, and that buyers do not hesitate to pay

good prices. Numerous sales have been made to settlers on the state land colony project at Durham. O. R. Moll, a new arrival in the Dunham community, secured a full sister to the 1917 Nebraska state fair winner. A boar by High Orion, the popular Missouri sire, was sold to Frank Tetereau of Red Bluff.

Bassett Loses Model Fellow

M. Bassett of Hanford, dean of Western Poland China breeders, reports the death of his herd boar Model Fellow. This boar was sired by Long Model and was out of Long Lady. He was farrowed June 19, 1915, and while he did not live to the age of most boars, he lived long enough to leave his mark in the Bassett herd. Mr. Bassett regarded him as one of most valuable boars he ever owned and counts his death a distinct loss to the breed. Fortunately the herd contains a goodly number of his selected daughters and these are being mated with the following boars: King's Gerstdale Jones, a grandson of the noted Gerstdale Jones; King's Timm by Sevier's Timm, who is a litter mate to the $5000 Liberty Timm; Orange King, a son of Ohio King; and California Buster, by the celebrated Giant Buster.

Trade has been unusually good the past season, and only a few head of gilts bred for spring farrow and boars old enough for service are left. There is, however, a nice lot of younger pigs of either sex.

Mr. Bassett believes he has as good feeding quality established in his hogs as can be found in any herd in the country and he proposes to demonstrate the contention with a carload of barrows that are being fitted for the San Francisco show next month.

Wasco Hogs Net $16.60-16.65

At the recent auction sale of fat hogs held at Wasco, five carloads sold at prices netting $16.60 to $16.65. One carload of rather rough stuff fetched $16.10.

One of the first hog auction sales held in this state was made at Wasco something over a year ago and since that time the popularity of that method of selling has gained in favor and resulted in raisers receiving substantial margins over the usually quoted prices.

Farm Bureau Hogs Sold at Fresno

The Fresno County farm bureau held an auction sale of fat hogs at Kearney Farm January 9, selling seven carloads at prices ranging from $15.15 to $15.85. The sale totaled near $16.000. Hogs were consigned by about 30 farmers. The heaviest contributors being the Fitzwilliams ranch, 60 head; Kearney Farm, 50 head, and H. E. Vogel, 40 head.

Armour Sends Hogs to South America

To help South America swine raisers improve the quality of their droves, Armour & Company are arranging to ship a large number of pure bred boars and gilts from this country for use in Brazil and the Argentine. Duroc Jerseys and Poland Chinas predominate in the lot that is being collected and conditioned for the first shopment south. Orders for other breeds are expected for future shipments.

Brock Bros. Sell Holstein Bulls

Brock Bros. of Pacheco report having sold a grandson of Dutchland Sir Korndyke Colantha to California state prison, San Quentin, and two grandsons of Tirzah La Polka Piertertje Lad, one to Dominik Wiget, Meridian, the other to Joseph Lucas, La Fayette.

Tulare Durocs Sold High

The first consignment sale held by the Tulare County Duroc Jersey Breeders' Association at Tulare, January 15, resulted in extremely satisfactory prices. Bred sows and gilts were absorbed by buyers at prices from $175 to $450.

There is an unfilled and growing demand throughout this state for better live stock of all kinds and breeders who are producing the better sorts are experiencing a keen demand at profitable prices.

Guaranty Holstein Sale, March 27

March 27 is the date set for the annual Holstein Guaranty Sale. The sale will be held on the grounds of the State Fair at Sacramento.

The number of cattle to be sold has not been announced but the management is busy selecting consignments and every effort is being made to catalog a superior offering.

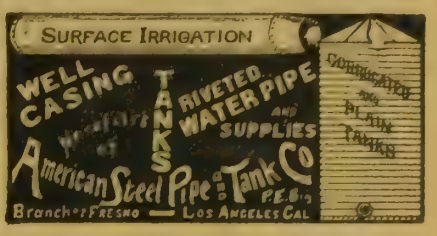
Sales Manager C. L. Hughes states that the majority of entries will be secured from the top herds of this state, and it is certain that several of the leading herds of the Northwest will contribute.

State Dairy Commissioner W. A. Barr of Arizona estimates the number of dairy cows in Arizona to be 84,000, 58,000 being producers, the balance young stock and bulls. The annual production is 260,000,000 pounds of milk. The number of dairy cattle has decreased 8000 during the past year, but the production during next year, he believes, will be greater than this year. Many, probably most, of the discarded animals were culls. Sixty per cent of all the cows in the state are in Maricopa County. The product is disposed of as follows: 22½ per cent consumed as whole milk, five per cent for ice cream and soda fountain trade, 25 per cent is condensed and the balance, 47½ per cent, is made into butter and cheese.

Jersey Breeders to Meet in February

Guy H. Miller, Modesto, president of the California Jersey Breeders' Association, writes that there will be a meeting of the association in February. The place and date of meeting to be announced later.

Mr. Miller states that his Venadera herd is in excellent shape and that, judging from his inquiries, there is a broadening demand for Jerseys throughout the state.



Mr. Miller recently sold the young bull, Altama of Palomar, a son of his well known herd bull, Altama's Interest, to C. H. Sturges of Yuma, Arizona.

Only Bull Calves For Sale

Swift & Company's 1918 profits shown in this book

Send for a copy. Contains facts and figures that will give you a better understanding of the conditions that govern the sale of your cattle, hogs, and sheep. Write for your copy NOW—*it is free*

Do you understand clearly the things that determine the prices paid for your live stock?

Do you know why the packers are interested in stockyards?

Do you know how the packer's dollar is disposed of—how much goes to you for your live stock, how much of it goes for actual cost of doing business, and how much is left the packer for his services?

Do you want to know the real facts about the Federal Trade Commission's investigation of the packing industry?

There is no mystery in the live stock and meat business. It operates under conditions of intense competition and, like every other industry, is controlled by fundamental business principles.

Swift & Company's 1919 Year Book contains many pages of valuable information along the lines of the foregoing questions—facts and figures that will give you a clearer understanding of market conditions and the sale of your animals.

It presents a review of Swift & Company's operations during 1918, and shows that the profits earned (about $2\frac{1}{25}$ cents on each dollar of meat sales) were too small to have any noticeable effect on live stock and meat prices.

Send us your name for this valuable book now—a postal will do.

for Calf Scours

Save every Calf. High meat and milk prices make control of Calf Scours doubly necessary.

Scouring calves indicate a germ infection that is likely to run through your entire herd with serious losses. The loss of one calf is bad enough, but nothing compared to your loss when the infection spreads, as it will unless checked. Then your year's work in building up your herd is wasted and your profits lost.

Our method of handling calves will promptly stop scours and finally banish it from the premises. One good calf saved will repay the expense of protecting your stock for a long time against the disease.

B-K, the powerful germicide and disinfectant, is especially adapted to this work. B-K contains no poison, acid nor oil. When used internally it destroys germs, heals inflamed membranes, relieves irritation, restores healthy action. B-K may be given freely in the milk and drinking water.

The B-K plan is simple and practical. It is giving wonderful results. A well known breeder of registered stock says:

"We found vaccines of no value in stopping calf scours, but the prompt, efficient treatment with B-K checked the trouble quickly and saved us the loss of many valuable calves."

B-K is sold by Dairy and Farm Supply Dealers, General Stores, Druggists, etc. If your dealer does not have it, send us his name.

There are over "145 Farm Uses" for B-K

FREE BULLETINS: Send for our valuable bulletin No. 136, "Calf Scours," also information on other farm uses and our "Trial Offer."

recently sold the short aged junior yearling boar, Grand Fashion Leader, to the University Farm, Davis.

Grand Fashion Leader was sired by Grand Leader 2d and is out of a Fashion Longfellow sow. He was selected by Professor J. I. Thompson for use on the University sows, most of which are sired by Star Leader, a son of Grand Leader 2nd.

Grandson of Woodford for California

H. M. Barngrover of San Jose, who maintains a herd of Herefords on his Plumas County ranch, has selected the young bull, Don Woodford 4th, to head his herd. Don Woodford 4th was secured from Walter L. Yost of Kansas City and is a grandson of the famous Woodford 500,000 formerly at the head of Col. E. H. Taylor's herd in Kentucky.

Tulare Dairymen Receive $168,000 in December

During the month of December, three creameries operating in the Tulare district paid dairymen $168,000. Butter fat ranged from 71 to 74 cents per pound and whole milk was taken at $6.00 per hundred.

More Money Asked for Fair

Senator James C. Nealon has introduced a bill in the legislature proposing that the state extend greater financial assistance to county fairs. The measure recognizes the fact that fairs are of direct and powerful aid in developing the resources of the state and it provides that not more than $10,000 may be appropriated in any one year to a single county.

Alexander P. Fleming of Los Angeles County has introduced a measure appropriating $75,000 to pay the deficit incurred by the management of the California Liberty Fair held at Los Angeles.

Barrows Now With Muddux

C. E. Barrows, a Berkshire breeder of some 20 years' experience on the Western Coast, and recently in charge of the Natomario Rancho herd, has arranged to take charge of the breeding operations of H. C. Muddux & Son, Sacramento.

Mr. Barrows was largely responsible for the winning of two grand championships at the 1917 National Swine Show for Brush herd.

Melba Hengerveld on Test

Melba Hengerveld, a registered Holstein cow owned by Alex Whaley, Tulare, is on official test and has 30.12 pounds butter and over 600 pounds milk to her credit in seven days with very good prospects for an increase. She is by Arcady Pontiac Wayne Hengerveld and was one of the top cows in R. F. Guerin's sale last spring. She is being handled on test by Harry L. Redd, herdsman at W. J. Higdon's Tulare Holstein Farm.

Bridgeford Holstein on Test

What is probably the first daughter of King Valdessa to freshen is on official test in the Bridgford Company Holstein herd at Knightsen, and has over 22 pounds butter to her credit in seven days as a two year old.

Higdon Cow Finishes Test

Wayne of Rock, one of the good registered Holstein cows owned by W. J. Higdon, Tulare, has completed a 305 day record with 17,707.6 pounds milk and 802.63 pounds butter.

Seven Day Official Test

Sir Skylark Ormsby Hengerveld Pet 2nd, a registered Holstein cow owned by Gotshall & Magruder, Ripon, recently completed an official record of 30.62 pounds butter in seven days. She is sired by Otto McClure's bull King Pontiac Netherland Segis, and is out of a daughter of Sir Skylark Ormsby Hengerveld.

New Holstein Herd at Tipton

F. S. Barron & Son, formerly breeders of registered Jerseys in the East have located on a farm at Tipton and are establishing a herd of registered Holsteins. Their first purchase was made at the Tulare sale in November and they have since purchased four choice females from W. J. Higdon, Tulare.

Alex Whaley Reports Good Record

Alex Whaley, Tulare, recently secured the good record of 18.18 pounds butter in seven days on a beautiful daughter of Aralia De Kol Pontiac Segis. This heifer dropped a fine heifer calf by King Morco Alcartra, son of Tilly Alcartra.

Sale of Holsteins

A sale of 40 registered Holsteins and 40 high grade Holsteins is announced for April 9, for E. P. Putz, Kingsbury, by California Breeders' Sales and Pedigree Company.

"Pleasure," said Uncle Eben, "can be imported, but happiness has to be home made."

The stones you throw at others today you will find in your pillow tonight.

WESTERN DAIRY PRODUCTS SHOW

The Western Dairy Products Show given by the Western Dairy Instructors Association will be held at Boise, Idaho, February 10 to 12.

Entry blanks have been mailed to butter makers and cheese makers for the butter and cheese classes and entry blanks for the market milk and cream classes have been sent to the dairy inspectors for distribution. A bulk cream class has been added this year which provides for cream producers of California sending to Davis, one five gallon can of cream. The cream will be paid for at market prices and the county farm bureau having the five highest scoring exhibits will receive a banner. Premiums in other classes will consist of gold and silver medals, banners and diplomas.

Last year the California butter makers entered the five highest scoring exhibits of butter in this show and a handsome silver trophy was awarded to the state and has been on exhibit in the dairy building at the University Farm. It is hoped that the butter makers will be as successful this year and that the trophy may remain in California another year.

The bulk cream exhibits must be shipped to Davis on January 28. Care C. F. Hoyt.

The butter, cheese, market milk and cream exhibits should be shipped express prepaid to Boise, Idaho on February 3rd. All milk and cream exhibits to be placed in tight boxes and covered with sufficient ice to last until reaching the destination. Additional entry blanks and rules governing the contest can be secured by writing Dairy Division, University Farm, Davis.—C. L. Roadhouse, Publicity Committee for California.

FOUR COUNTY DAIRY COW CONTEST

We have from Ernest L. Conant, assistant emergency demonstration agent, correction and additional information on article under this same caption which appeared in the Cultivator of January 18.

At the present time the committee in charge of this work have secured more than $2500 worth of prizes. These prizes consist of cash, pure bred live stock and merchandise. The committee in charge of this work, A. E. Greene, of Hood, chairman; Guy Foulkes of Elk Grove and R. E. Watson of Sacramento, have been doing splendid work in getting this contest started and we find that considerable interest is being shown by our members in the contest.

In view of the fact that all milk sold by our members is sold on a butter fat basis, it was deemed best to make this contest solely on a butter fat production basis; as shown by the figures of the test supervisor.

The following classes were adopted as being suitable for our conditions:

Class A—Herds of 5 to 20 cows; highest yearly average production.

Class B—Herds of 21 to 50 cows; highest yearly average production.

Class C—Herds of more than 50 cows; highest yearly average production.

Class D—Highest herd in each of the above classes headed by a grandsire.

Class E—Highest producing cow under five years, yearly record. Second highest producing cow under five years, yearly record.

Class F—Highest producing cow over five years, yearly record. Second highest producing cow over five years, yearly record.

Class G—Highest monthly group of five cows in one herd. Cows winning this once are barred from further competition in this class.

Class H—Highest yearly average of grade Jersey herd.

Class I—Free for all; for herd showing greatest improvement in last six months of 1919 over last six months of 1918.

Class J—Free for all; best herd.

It will be seen from the above that all except classes E, F, I and J are restricted to grade herds. Any herd composed of more than 50 per cent grade cows will be considered a grade herd. Any herd carrying Jersey blood will be considered to be eligible in class H. Any herd using a grandsire on January 1, 1919, will be considered to be eligible to competition in class D. Classes A, B and C will be determined by the average number of cows tested during the year. Classes E, F, I and J are open to all herds, grade and pure bred alike.

Ducks on the Farm

Written for California Cultivator By Jean A. Koethen

DUCK raising on a large scale has been developed as a special business on Long Island and near some large Eastern cities, but lack of a wide and steady market has prevented its development generally throughout the country, and especially on the Pacific coast where climatic and feed conditions are less favorable than in the East. The Pekin duck, which is the only variety suitable for the "green" duck market, is a large, vigorous bird, grows rapidly, stands confinement well, is less susceptible to disease than a chicken, and more easily brooded, but the price paid for green ducks at ten weeks of age is hardly more than half what a chicken the same age will bring, and the cost of raising the duck is about the same. A bulletin recently issued by the department of agriculture says: "The demand for table ducks at good prices is largely limited to the large cities and is not nearly as general as the demand for chickens. The market conditions should be studied carefully before a large investment is made in ducks. A prejudice against duck flesh and eggs exists in many places, caused probably by eating the common or 'puddle' duck which has been allowed to roam in places where filthy conditions exist." The same bulletin states that the feed cost of growing Pekin ducks to ten weeks of age, when they weigh from five to six cents a pound, is estimated at from five to six cents a pound (1915). This estimate is much below that of an Inglewood man with whom I talked in 1917. He estimated that in selling green ducks at ten weeks of age at 17 to 21 cents a pound he made a profit of seven or eight cents a pound. Under present conditions feed costs are doubtless considerably more and profits proportionately less.

On general farms where there is plenty of green range, duck raising on a small scale ought to be fairly profitable. On bottom land, such as we find along all our Southern California rivers, they do particularly well and are valuable for both eggs and meat. Indian Runners on such range require a minimum amount of feed, and if they bring less in the markets than hens' eggs, which is not always the case, are admirable for use at home. Thousands of California farmers do keep a few ducks and find it worth while.

Pekins for meat and Indian Runners for eggs are most generally kept, but the meat class of ducks includes the Pekin, Aylesbury, Rouen, Cayuga, Buff and Swedish. The Muscovy and Rouen are not as good layers as Runners, nor as well adapted to market purposes as the Pekin, since the Rouen matures more slowly, and the difference in size between the Muscovy duck and drake is too great, but they are handsome birds, and favorites with fanciers. The Muscovy moreover is a wide forager and requires little care, which is a great recommendation. The Buff duck is recommended both as a layer and table duck but does not equal the Pekin in the one respect nor the Runner in the other.

In the East the wild Mallard duck is being domesticated on farms where there is marshy ground. It brings high prices in season, is very hardy and easily raised. With ample range these birds are said to be practically self supporting for half the year. The ducklings are hatched either by hens or by the parent ducks and are fed a purchased feed prepared especially for ducklings, or a mixture of hard-boiled eggs and fine oatmeal, moistened with boiling water. Later they are given commercial duck feed, bone meal and grains, and an occasional feed of boiled rice. The general testimony of experienced breeders is that they can be raised more cheaply than most domestic ducks.

In planning a duck pen allow six to seven square feet of ground space to each duck. In this climate ducks require but little shelter, a shed-roof house, open in front and with dirt floor being sufficient. Green range is not necessary but it simplifies feeding greatly. Water need be given only in tubs or pails which will permit the birds to immerse the heads. Ducks which cannot wash their heads frequently become infested with vermin.

Ducks are mated in flocks of about 30 females with five or six males. In single pens one drake is usually mated with not more than five females. Active, healthy, mature ducks should be used for breeding. The best breeders may be kept three years, but general practice is to dispose of all but the very best at the end of the second year.

The breeding season for ducks begins the first of January. Pekin ducks that are to be used for breeders should be put on an egg ration about December 1. This ration consists of a mash composed of equal parts by weight of corn meal, middlings and bran, with 15 per cent beef scrap and 15 per cent vegetables or greens. This mash mixture, moistened with water till it is crumbly but not sloppy, is fed morning and night. At noon a mixture of corn and wheat (one quart to 30 ducks) is fed. Thirty Pekin ducks when laying will eat about ten quarts of moist mash at a meal. The same ration may be given to Indian Runners the year round if they are laying. When they are not laying they should be fed sparingly. Cracked corn is preferable to whole for ducks of all ages and breeds.

Both ducks and ducklings are usually fed their moist mash on a flat board. A vessel of water should be close by so that they may wash their food down. Ducks do better without much dry food though many seem to thrive on the same ration that is given to chickens. Alfalfa, barley or any other green feed may be cut up and added to the mash, and a little sand is added to the mash given to ducklings.

Duck eggs hatch well in incubators, but when only a few ducklings are to be raised in a season they are usually hatched by hens. The eggs require 28 days for incubation, except those of the Muscovy, which require from 33 to 35 days. As ducklings are slower than chicks in getting out of the shell, it is a good plan to let the hen get off the nest to eat when the eggs begin to pip, and then to confine her till the hatch is over. Just before the hatch begins the eggs may be sprinkled with warm water. This does not seem to be necessary in all cases, but it does no harm and makes it certain that the eggs will have all the moisture they need.

When duck eggs are hatched in incubators the temperature should be kept at a slightly lower temperature than for hens' eggs. Most incubator directions recommend a temperature of 102 degrees the first three weeks and 103 degrees the last week. If directions are carefully followed a good hatch may be expected. More moisture is needed for duck eggs than for chickens, and this is provided sometimes by a pan of water, sometimes by moist sand, sometimes by a wet sponge below the tray, and sometimes by sprinkling the floor of the incubator room. The amount of moisture needed depends upon the weather.

Ducklings are left in the incubator or under the hen from 24 to 36 hours after the hatch is over. It is not necessary to warn against feeding ducklings too soon, for they will not eat until they are ready, no matter how much food is placed before them. Ducklings hatched by hens are brooded by the hens if the hens will care for them, but they are so different from chickens that many hens refuse to mother them. When this happens they may be transferred to a brooder. As ducklings require far less heat and mothering than chicks, they are raised with little trouble in any sort of brooder. A heated brooder is desirable for the first week or so, but a fireless brooder, if kept indoors at night, supplies ample warmth except in very cold weather. Most of the ducklings raised in Southern Califor-

nia are raised, I believe, in fireless brooders.

Ducklings seem to be entirely lacking in the homing instinct which is so strong in chicks. If they are not kept confined the first few weeks they will wander off and lose themselves. They are an easier prey to squirrels and other "varmints" than chickens, whether because the latter find them a more delicate morsel, or because they do not sense the approach of danger as chicks do, I do not know. I have never heard of squirrels attacking chicks, but have known of their attacking ducklings more than once. On this account they must be quite carefully confined at first. A board a foot high will keep them from wandering, but a covered coop is necessary if they must be guarded from animals.

A good nursery feed for ducklings consists of equal parts, by measure, of rolled oats and bread crumbs, with 3 per cent of sharp sand mixed in. This is made crumbly with water and fed on a board five times daily. Water is given in a chick fountain at meal times but is removed when the meal is over, lest the ducklings play in it and wet their down. A wetting before they have their real feathers is often fatal. About the third day the nursery feed is changed to equal parts bread, rolled oats, bran and corn meal. After the seventh day it is changed again to three parts bran, one part each of middlings and corn meal, ten per cent green feed and five per cent beef scrap, with about three per cent sand or fine grit in all mashes. From the end of the first week to the end of the third, ducklings are fed four times a day. After the third week, three meals daily is sufficient, unless they are to be pushed for the green duck market, when the mash may be kept before them all the time. After the first month the amount of corn meal is gradually increased and the amount of bran diminished, until two weeks before killing time the ration consists of three parts corn meal, two parts middlings, one part bran, one part beef scrap, three per cent sand and ten per cent greens. Middlings may be omitted when necessary, in which case equal parts bran and corn meal may be used. For Indian Runners, which are to be kept for eggs, equal parts bran and corn meal, with 15 per cent beef scrap and 15 per cent greens and one meal a day of hard grain should be the ration after the first eight weeks.

Farmers' Bulletin 697, issued by the United States department of agriculture, gives full directions for raising and feeding ducks and may be had free by writing the division of publications. It should be in the hands of every one who is interested in ducks.

COULD NOT DO WITHOUT INCUBATORS

Poultry raising could not be looked upon as a business; it could not even be considered a profitable side line, if incubators had never been invented. Nowadays, when every minute counts for something, it is doubtful if very many farmers' wives by hatching and brooding with hens would have time to hatch and raise more than enough chickens for home use, but with an incubator and suitable brooding equipment it is no great chore for anyone on a farm to raise from 200 to 500 chicks in a season. On many farms it is not uncommon for as many as 1000 chicks to be raised each year. Before incubators came into existence, poultry raising was never given much consideration by anyone. Quite a contrast with what is being done now by the government, agricultural colleges, experiment stations and various other institutions in behalf of the humble hen. The incubator has revolutionized this business of raising chickens and has made of it a business worth while. Is your incubator ready for business this season?

POULTRY BREEDERS ANNUAL

The annual meeting of the Poultry Breeders of Southern California Inc. was held at the office of the company, 1516 Industrial Street, Los Angeles, 10:00 o'clock Friday, January 31. Presumably the newly elected directors will meet at once and organize for the coming year's business. State Market Director Weinstock attended the meeting. This association is a strong factor in making successful the poultry breeders of California.

The Pride of Petaluma

VENTILATING BROODER STOVE

Solves VENTILATION, gives about ten times more WARM FRESH air to chicks than any other brooder stove.
It's the only brooder stove with two RADIATORS hence compound ECONOMY.

It keeps chicks from crowding by proper application of heat, the only SENSIBLE way.

It's the only brooder stove using CHEAP OIL TOPS successfully as fuel.

It's PETALUMA'S latest sensation, and only brooder stove. It skins the bunch in ECONOMY, Volume of VENTILATION and PROPER APPLICATION of HEAT. GUARANTEE—SIMPLY send it back any time within 30 days' trial. If you don't think it beats anything you ever saw.
Get our catalogue No. 25. That's fair. TRY IT.

Kresky Brooder Stove Factory
Petaluma California

Get Eggs to Sell— and Eggs to Hatch

The big demand for poultry products insures a continuance of high prices for a long time. Take advantage of this money-making opportunity. Make *your* birds lay heavily *now*. Have lots of eggs to sell. And get highly-fertile eggs too, the kind that gives big hatches of sturdy chicks which will grow rapidly to market weight. Use

Pratts Poultry Regulator

to put your layers and breeders in perfect physical condition. Abounding health and vigor mean profitable egg production and strong, vigorous chicks.

Pratts Poultry Regulator keeps the flock in splendid health and that means better results, greater production, bigger profits. It tones up and strengthens the organs of digestion, assimilation and reproduction, enabling each to do full duty. And it does this work in a perfectly *natural* way. It is a scientific combination of tonics, appetizers, digestives and laxatives which are so necessary to heavy production. Test it *now* on all or part of your flock *at our risk*.

Sold by Pratt dealers everywhere. "Your money back if YOU are not satisfied."

SEEDS AND PLANTS

Early Amber Sorghum Seed for Sale—Choicest sorghum seed on the market; 9c per pound. This seed selected from high producing fields that made 15 tons of heavily grained silage per acre. This plant produces more tons of silage of high feeding value than any other silage crop. It makes silage of the best quality, equal to Indian Corn silage and more tons per acre. The grain makes good poultry, hog or stock feed and the fodder makes excellent stock feed. Samples sent free. Order now for spring planting. Seed Dept. Elliott-Brant Rancho, Owensmouth, California.

Dwarf Milo Seed for Sale—Selected milo seed from fields producing two tons of threshed grain per acre for sale at eight cents per pound. Seed is heavy and plump, recleaned and of high germination quality. The grain from this plant makes the best poultry, hog and stock feed on the market. The fodder makes good stock feed. Samples sent free. Order now for spring planting. Seed Dept. Elliott-Brant Rancho, Owensmouth, California.

I Will Have One or Two Tons of Sorghum seed, especially selected for syrup making qualities for sale as long as it lasts. Send for list of different varieties, with description, prices and instructions for planting to get best results. Can send seed by parcel post. MARION GRABER, Hawthorne, California.

Tested Seeds and Plants — Strawberry plants $1.00 per hundred; 426 gallons fine syrup made from less than one acre Light Orange Cane. One ton Jumbo peanuts raised from one half acre. Seeds for either, 5 pounds for $1.00 f. o. b. Arlington. Address Primma Vista Gardens, Arlington, California

GET THAT SQUIRREL

Continued from Page 131

Poisoning can be done very effectively by a boy or man on horseback.

Carbon can now be purchased at about 85 to 90 cents per gallon. This will treat about 55 to 60 wasteballs. Wasteballs can be bought at $3.00 to $4.00 per 1000. Very good wasteballs can be made by cutting useless barley sacks or old cloth into strips four inches wide, tying a knot and cutting off the knot.

The rodent control division of the state commission of horticulture recommends the following formula originated by the United States biological survey for mixing poisoned barley for the destruction of squirrels. In many places the farmers get together and mix the formula in large quantities. Get the ingredients through the horticultural commissioner, who can furnish them at cost in large or small quantities.

Barley	16 qts.
Strychnin (powdered alkaloid)	1 oz.
Bicarbonate of soda (baking soda)	1 oz.
Saccharin	1/10 oz.
Heavy corn syrup	¼ pt.
Thin starch paste	¾ pt.
Glycerin	1 tablespoonful

In a clean vessel mix thoroughly one ounce of powdered strychnin (alkaloid), one ounce of common baking soda and one-tenth ounce of saccharin. Crush all lumps of the soda with mixing spoon. To this add one-fourth pint of heavy corn syrup and stir thoroughly to a smooth, creamy paste free from lumps. Over this pour three-fourths pint of thin hot starch paste and stir well. (The starch paste is made by dissolving one heaping teaspoonful of dry gloss starch in a little cold water which is then added to three-fourths pint of boiling water. Boil constantly until a clear thin paste is formed.) Add the tablespoon of glycerin and stir thoroughly, making sure that none of the heavy syrup paste still sticks to the bottom of the container. Pour this mixture over 16 quarts of good cleaned barley and mix well so that each grain is coated.

For mixing small quantities an ordinary galvanized wash tub is convenient. For larger quantities a tight smooth box may be used, and the mixing done with a spade. Each quart of the poisoned grain is sufficient for 40 to 50 baits. This quantity scattered along squirrel trails or on clean hard places on the surface about the holes will not endanger stock. Strychnin in any form other than the powdered strychnine alkaloid is not effective in the above formula.

Caution

All poison containers and all uncleaned utensils used in the preparation of poisons should be kept plainly labeled and out of the reach of children, irresponsible persons and live stock.

SING A SONG OF SWEET CORN

Sing a song of sweet corn,
A garden full of chard,
Four and twenty egg-plants
Growing in the yard.
When the crops are gathered
The folks can have some lunch;
Isn't succotash a dish
To set before a bunch?
Father's tending the beets and chives.
Saving up some money;
Mother's out among the hives
Taking off the honey;
The kids are in the garden
Pulling out the weeds.
Don't we get a lot of food
From half a peck of seeds?
—Farmer's Guide.

Blythe, Riverside County, will have need for two new cotton gins before the next crop is ready for handling. There are now three gins in operation.

Household Department

AND LET LIVE

By Strickland Gillilan

A thready root of a peachtree grew
Where the roots of pear trees wandered, too.
And a tulip poplar sent its shoots
To mingle in with the other roots.
Then locust, maple, oak and pine
Put out their nerves to intertwine
One with the other in common soil—
To build trunk, bough and leaf their toil.

But the peachtree rootlet always found
Peach-making stuff in the very ground
Where each of the others shrewdly chose
The sap from which its own kind grows.
Although they fed from the selfsame dirt
None gave or received the slightest hurt,
They never quarreled or glared or fought
As there in a tangled web they wrought.

For one was a pear and one was a peach;
The kind soil sated the wants of each.
Where the locust roots found stuff for pods,
Long tulips came from the clever clods
When the poplar called; and acorns grew
As the want of the oak the moist soil knew.
Slim needle and resin and cones for the pine
Were digged from the same, exhaustless mine.

Here's a business lesson for you and me
(And for nations, too, if they could but see);
God isn't a dolt or a copy-cat—
Dont ever believe such a thing as that.
This world He has given will amply feed
The lives of us all, to our utmost need.
Your share and mine lie side by side
And each may take till he's satisfied.

And none is robbed if the others know
The stuff that will make their ownselves grow
And take but that, as the sapient roots
Have tutored their frailest, farthest shoots.
The sap that the tulips soft discard
Will turn into oakwood fine and hard.
Though toiling together, let each his own
Use freely—and let the rest alone.

—Retail Public Ledger.

TEENY'S INSPECTOR

By Hilda Richmond in Youth's Companion

LOOK out, Miss Schmidt! There goes the mucilage bottle!" cried Mr. Wallace, with exasperation in his voice. He grasped at the rolling bottle, which was leaving a stream of sticky fluid on the clean blotter he had just tacked to the money order desk. "Never mind," he added, as Christina jumped, and clutched awkwardly at the bottle, only to complete the destruction. "I can clean it up in a few minutes."

"Isn't she the limit?" said one of the rural carriers outside the window. "I don't see why the P. M. ever took her."

"I suppose he felt sorry for her," sighed the assistant postmaster, as he mopped up the mess after declining Christina's offers of help. "Her mother has a hard time of it, and Christina is the only one old enough to help her. She is so awkward that she upsets everything. Just imagine any one of the other clerks we've had doing a trick like this."

"Yes, but you said the other clerks were rattle-pated, and you can't say that about Teeny. She is bright as a dollar."

"Oh, she's bright enough," admitted Mr. Wallace. "Her marks at the examination were the highest on the list."

In the general delivery, just out of hearing, Christina, or Teeny, as she was called by the rural carriers, who had known her all their lives, was wiping away a few stray tears and resolving anew to be careful. Somehow she was unlucky with everything she touched, but she was so desperately afraid of Mr. Wallace that she could hardly be blamed. She knew that he disapproved of her, and it so weighed upon the poor girl that her natural awkwardness was increased.

Teeny wore large shoes that made her clump about the place like a man; and although her clothes, chosen by her hard-working German mother, were always neat and clean, they left much to be desired in the way of style and fit. Contrasted with the pretty young lady who had left the general delivery three months before in order to get married, Teeny was like a baby elephant, the carriers said, but they considerately said it out of her hearing. Mr. Dillon, the postmaster, was a kind man, with granddaughters almost as old as Teeny, but the others made life wretched for her without meaning to.

"Is the postmaster in?" inquired a voice, as Teeny sat thinking of her woes. The sudden start she gave sent the "nixie" letters flying in all directions.

"Mr. Dillon is at home, sick in bed," she managed to say.

"That's too bad," said the stranger, with concern in his tones. "Perhaps the assistant postmaster is here? I am James Greshom," he went on, as Mr. Wallace came up. "I am an inspector sent to examine the office."

"Will you show me your commission?" inquired the assistant.

"Certainly." He opened his satchel and produced his credentials, and then Mr. Wallace admitted him to the office.

"If the postmaster is too ill to come down we will go ahead with the inspection, for I want to catch that four o'clock train south," said the inspector, briskly. "No doubt everything is in good shape, so that it will not take long. We will begin with the stamps, if you please. Just spread them out in the private office, and I will count them. In the meantime you may get out any other supplies you have. Do you keep anything in your local bank?"

"We have fifty thousand stamps there," said Mr. Wallace, as he opened the safe. "That is, fifty thousand twos; and there are some broken lots of other denominations."

"What time does your bank close? Can you send for them at once?"

"It will only take a few minutes to get them," said Mr. Wallace. "Miss Schmidt, can you look after both windows while I am gone? Trade isn't very brisk this afternoon."

Christina promised, and everything settled down to quiet in the office. The rural carriers, seeing the inspector at work, silently finished their tasks, and then slipped out into the gloom of the dull November afternoon. The girl watched both windows nervously for possible customers; she felt sure that something would go wrong, and the more quietly she tried to move about, the more noise and confusion she made. She had heard that newly appointed clerks might be removed at the end of six months' probation if not efficient, and she became convinced that the inspector would recommend her removal that afternoon. She had been teased so much that she jumped every time she was spoken to.

By the time Mr. Wallace returned from the bank, the inspector had finished counting the stamps. "Seventeen thousand five hundred and fifty two-cent stamps," said the inspector, jotting down some figures on his pad. "Now for the twos from the bank."

"There ought to be more than that," said Mr. Wallace.

"Well, maybe I have made an error. You look them over while I take the ones."

But when Mr. Wallace counted the stamps, he found the number recorded by the inspector to be correct. He was getting worried, but the inspector urged him to keep cool. "You probably have some stock in another part of the safe that you have forgotten," he said. "Look the place over carefully."

The inspector, the assistant postmaster, and even trembling Teeny counted the stamps again, but they found that the shortage was the same. According to the inventory at the close of September and the record of the daily sales, there should have been more than seventy-five thousand two-cent stamps. The one-cent stamps were short also.

Teeny forgot her fear of Mr. Wallace in feeling sorry for him. Nervously he raked and scraped every corner of the desks, the safe, and even the boxes in the general delivery, but no stamps appeared.

"Who are the bondsmen for the postmaster?" asked the inspector, thoughtfully, when the search was ended. "We'll have to send for them if you think Mr. Dillon is too ill to be told of the condition of affairs. Mind you, I think there is only some mistake in misplacing the stock, and though my daily report will have to recommend a reprimand for the careless way you keep things here, I will give you a little time to straighten up matters."

"If there is any shortage, I will take care of it out of my personal bank account," said Mr. Wallace, firmly. "I wouldn't have Mr. Dillon know of

The Cultivator Patterns

8985—Boys' Suit. Cut in sizes 2, 4 and 6 years. The blouse is double-breasted and the straight trousers are separate.

8980—Ladies' Shirtwaist. Cut in sizes 36, 38, 40, 42 and 44 inches bust measure. The graceful frills are gathered under the collar at each side.

8992—Children's One Piece Dress. Cut in sizes 2, 4, 6 and 8 years. The neck is slashed at the front so that the dress goes on easily.

8996—Misses' and Small Women's Dress. Cut in sizes 16, 18 and 20 years. The dress has a simple, rather close-fitting waist with fastening at center back.

8997—Misses' and Small Women's Long Waisted Dress. Cut in sizes 14, 16, 18 and 20 years. The dress fastens on the shoulders and is to be slipped on over the head.

8975—Girls' Dress. Cut in sizes 6, 8, 10, 12 and 14 years. The skirt is gathered to a plain underwaist which buttons at the front.

8994—Ladies' Two Piece Straight Gathered Skirt. Cut in sizes 24, 26, 28, 30 and 32 inches waist measure. The front of the skirt is plaited to give the effect of a panel.

PRICE OF ANY OF THE ABOVE PATTERNS 10 CENTS EACH.

HOW TO ORDER PATTERNS

Write your name and address plainly in full, give correct number and size of each pattern you want, and send 10 cents in coin or (1 or 2 cent) stamps for each number. In order to furnish our readers with the very latest New York City styles, all pattern orders are filled in New York City. Therefore, we promise to deliver all patterns ordered within two weeks; we guarantee safe delivery of all patterns. Address

PATTERN DEPARTMENT
CALIFORNIA CULTIVATOR
Los Angeles.

this for anything. He is one of my best friends, and the shock might kill him. I am sure everything is perfectly straight and honest, and if you will give me time to look things up, I think we can find the stock or the money. I'll own it looks bad, but if you can get along without sending for the bondsmen, I'll be greatly obliged to you."

"Well, I might take charge of the office myself, and give you a chance to look up the shortage, though I take a chance of getting into trouble by doing so. You know how strict the department is with us, and my report should be mailed at once; but if you think you can look it up tonight, I'll wait till morning. It's almost too late for that four o'clock now, and I might as well stay over. Isn't that bank closed? How are you going to get the money for the shortage?"

"I'll go this minute and get every penny I possess, and put it here as a guarantee that I mean what I say when I tell you things are all right," said the assistant, warmly. "I'm honest, and I can vouch for Miss Schmidt. I know it's all right, and I want to prove it to you. I don't want this to get all over town, either."

(Continued next week.)

WOUNDED IN NO MAN'S LAND

Some of the sufferings endured by wounded British soldiers in removal from the dugouts behind the lines to hospitals in England are suggested by 17-year-old Tommy Kehoe, England's youngest veteran, in the final installment of his war story, "The Fighting Mascot," which appears in Boys' Life:

"I had been in the dugout three days when the M. O. told me that before night they were going to start me off toward Blighty.

"A little later I was carried out with a number of other wounded and put into a 'shaker,' and away we rolled for the railroad. I learned then why they called the ambulances 'shakers'. The The life was almost shaken out of me before we had gone half a mile. Every time the thing bumped or lurched a chorus of groans went up, and one chap fainted and did not come to all the rest of the ride. It took two dreadful hours to get to the railroad, and we were all half dead by that time.

"The train was not much better than the 'shaker', though being full of wounded it traveled slowly. At last they carried us out and into the base hospital at Boulogne.

"Two weeks I lay in the Boulogne hospital and then on a fine, clear day, with a breeze blowing strong and salty from the sea, and the wounded all happy, for the time had come when they were to see their friends and families again, they shipped me for old Blighty.

"It was a hard crossing for us all as the boat rolled up and down in the big sea swells till I wished myself back at Boulogne. I was in bed on the upper deck, strapped down with weights, with not a soul to talk to and nothing to do but listen to the chugging of the engines and the splashing of the sea. Out in midchannel I overheard a nurse say that three operations were going on at that very moment and that a wounded man had passed west a few minutes before. Then people came hurrying past me talking of a submarine that was chasing us, and I did not know for a time whether it was Blighty or the bottom of the sea I was going to. But the submarine dropped out of sight and at last we steamed into Dover. There we landed but we were soon on the way to Folkestone and London, and I heard the little river steamers chugging as we went up the Thames and breezes from the fields of old England were in our faces and I felt like a lad coming out of a dream, a bad one, with the war so far away and home so near."

BIG HOMINY

In nutritive value, corn ranks next to oats as a breakfast food. Big hominy or hull corn prepared at home is an old time favorite. Select sound white flint corn. Remove chaff by pouring from one pan to another. Do this where there is a strong breeze. Wash grain thoroughly in water. To a pint of corn add a heaping tablespoon of soda. Cover with water and soak overnight. Drain and wash thoroughly in two waters, rubbing the corn with the hands. This removes the hulls which will rise to the top and may be poured off.

Boiled Hominy

Salt and boil corn slowly until thoroughly tender. This can be served instead of potatoes for breakfast, dinner or supper. With milk and salt it makes an excellent breakfast food.

Brown Hominy

Heat in an iron skillet a teaspoon of fat. Fill skillet with boiled hominy and press down tight. Bake in oven until a thick rich crust is formed on bottom and sides. Loosen from skillet and turn out on flat dish, brown side up. Serve at any meal; it is always good.

Hominy and Cheese

Put in greased baking dish alternate layers of boiled hominy and grated cheese. Pour over it enough milk to come halfway to the top. Cover with buttered crumbs and brown. Serve this as a substitute for meat.

A RATHER NOVEL COMPLAINT

An English traveler once met a companion sitting in a state of the most woeful despair and apparently near the last agonies by the side of one of the mountain lakes of Switzerland. He inquired the cause of his sufferings.

"Oh," said the latter, "I was very hot and thirsty and took a large draft of the clear water of the lake and then sat down on this stone to consult my guidebook. To my astonishment, I found that the water of this lake is very poisonous! Oh, I am a gone man! I feel it running all over me. I have only a few minutes to live. Remember me to—"

"Let me see the guidebook," said his friend. Turning to the passage, he found, "L'eau du lac est bien poissoneuse" (The water of this lake abounds in fish).

"Is that the meaning of it?"

"Certainly."

The dying man looked up with a radiant countenance.

"What would have become of you," said his friend, "if I had not met you?"

"I should have died of imperfect knowledge of the French language."

SHE KNEW HIM

President Taft was out for his afternoon walk in Washington one day when a flaxen-haired little girl ran out in front of him, held up her finger, and exclaimed in a shrill baby voice:

"I know who you are!"

The president, thinking it not at all unusual that she should possess this information, but willing to gratify her, asked:

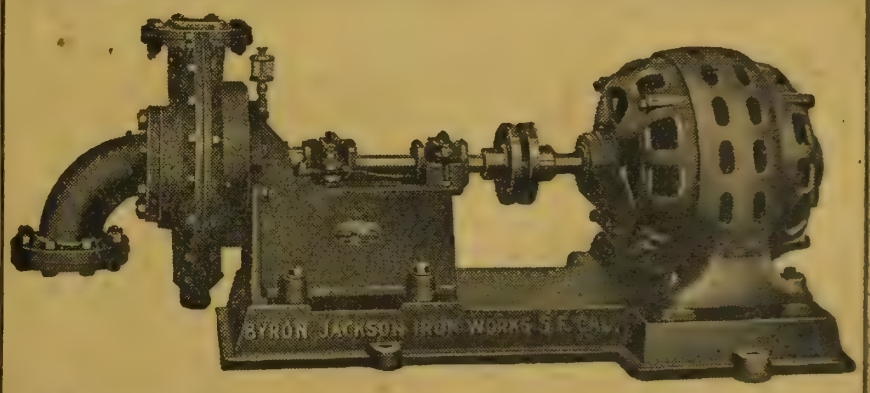
"Well, who am I?"

"Aw," she said teasingly, "you're Humpty Dumpty."—Everybody's.

Try stewing your dried fruit in the oven when you have a baking or ironing fire. Cover tightly to improve the flavor.

CROP PRODUCTION

Is controlled by the kind and quantity of plant food furnished the tree or plant.



It is not enough to merely fertilize. It is important that the tree be fed material giving maximum results under California conditions.

These materials are furnished in

Hauser's Organic Fertilizers

Correct fertilizer for California conditions.
Send for fertilizer booklet, tells you why.

It Keeps Them Working

No tree is *naturally* lazy. They all want to bear and bear heavily and they will if you give them a chance. *But they don't have a chance* if the soil is packed so hard around their roots that it half strangles them. Plowing between the rows will help—but no plow can cut deep enough to give the roots the "breathing space" they need.

HERCULES DYNAMITE

exploded between the rows of your bearing orchards thoroughly loosens the soil around their roots without disturbing the roots themselves. It pulverizes the soil many feet lower than any plowshare can reach. This gives the delicate roots a chance to spread and helps to nourish them by freeing the plant food and moisture that is deep in the earth.

Our 68 page illustrated book "Progressive Cultivation" tells you how to cultivate your bearing orchards by blasting between the rows. It tells you, too, of many other uses of dynamite on the farm and in the orchard. Sign the coupon printed below and send it to us *today*. We will send you, by return mail, a copy of this interesting and instructive book.

The Famous Hardie Junior is a Real Power Sprayer

It has sufficient capacity, for two lines of hose. It has plenty of power for high pressure effective spraying. It is little in first cost, engine power, pump capacity and ability to do successful spraying. WE believe this is the greatest small power sprayer ever manufactured, and placed on the market with phenomenal success in every fruit section in United States and vouched by thousands who own the Famous Hardie Junior. Equipped with one and one-half horsepower engine, battery ignition, 150-gallon tank with mechanical agitator, capacity of four gallons per minute with a steady working pressure of 200 pounds, and two 25-foot of the best spray hose, fitted with spray rods and nozzles; 4-inch tire truck with pole or shaft.

ALL FOR $300. DELIVERED ANYWHERE IN THIS STATE.

If truck is not needed, deduct $55.00.

These prices are subject to change without notice. The wise buyer will place his order now.

This low price is made possible by big production.

If you are interested in other types and sizes of the HARDIE POWER SPRAYER write us for the big spray catalog, and learn why we can offer more spray pump value than any other spray pump manufactured.

The Hardie Orchard Gun Is Now $12.00

none better, all guns are guaranteed to satisfy the user or their money refunded. The Hardie spray hose is the safest hose to buy.

LIVESTOCK

Receipts of live stock have been a little more liberal in the past few days, more especially hogs. Steers and cows are a little easier at this writing but future prospects of a much higher market are in evidence. Hogs are about steady with prices ruling at last week's close. The agreed minimum of $16.50 is being paid f. o. b. Los Angeles for No. 1 hogs. Lambs are fully steady; mutton is weak with a very light demand. Receipts in Los Angeles from California, Nevada and Arizona the past week of all live stock, 228 carloads, as compared with a year ago, receipts 204 carloads.

Following are the live stock prices Tuesday, January 28 in Los Angeles, f. o. b., packers' yards. Prices at country points are $1.00 to $1.50 per hundred weight less than those quoted:

Good steers, 13.00@14.00; medium steers, 12.00@12.50; common steers, 10.00 @11.50.

Good cows, 10.00@11.00; medium cows, 8.50@9.20; common cows, 6.50@7.50.

Hogs, No. 1, 150 to 225 lbs., 16.00@ 16.50; No. 2, 250 to 350 lbs., 15.00@15.50.

Lambs, 65 to 80 lbs., 15.50@16.00; wethers, 11.00@12.00; ewes, 8.50@10.50.

Twenty-one cars of live stock were loaded January 27.

POTATOES

Citrus Fruit Market

Los Angeles, Cal., Jan. 29, 1919.

Florida has now shipped approximately 10,000 cars and Central District Brights are quoted around $3.60-3.85 f. o. b. shipping point, but leading auctions have usually brought them $3.75 to as high as $4.75. California shipments are increasing rapidly and most shippers are manifesting a desire to ship only fruit from known uninjured orchards. Prices have been shaded somewhat but a fairly firm condition prevails. Water separators are being installed in many packing houses and under present weather condition the injured fruit will soon lighten so as to readily separate. There is still around 12,000 cars Navels, and a total of about 14,000 cars of Valencias is anticipated.

The lemon market may be considered in fair condition. There are but few of foreigns arriving and it is thought that the reduced California supply will command satisfactory prices.

Shipments

Shipments of citrus fruits to date since November 1, 1918: Southern California; oranges 4337 cars, lemons 1551, total 5888. To same date last season; oranges 3053, lemons 706, total 3759. Central California this season; oranges 2915, lemons 299, total 3214. Last season to same date; oranges 1860, lemons 94, total 1954. Northern California; oranges 244, lemons 1. Last year same date 202.

POWER - SIMPLICITY - ECONOMY

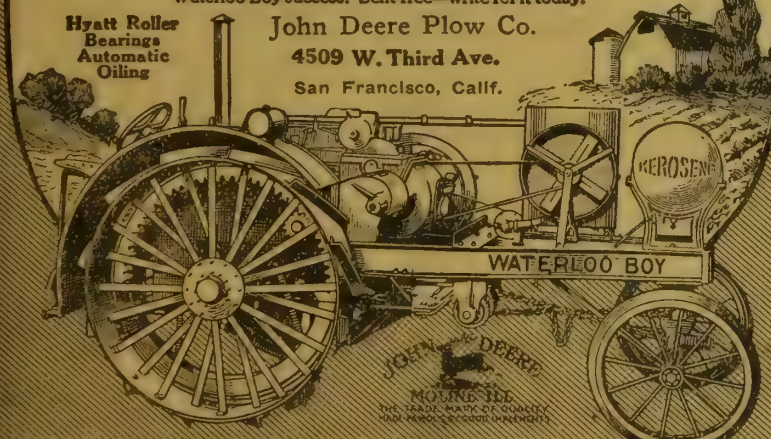
WATERLOO BOY
ORIGINAL KEROSENE TRACTOR

Dependable Power that does not fail when your farm work has been delayed and you must take advantage of favorable weather and ground conditions.

Simple Power which the inexperienced hired man can utilize to full day capacity, at any drawbar or belt job on the farm.

Reserve Power that's available in emergencies—for variable soil conditions or upgrade work.

Economical Power that insures low operating cost—works all day under full load on 18 gallons or less of cheap kerosene.



Built to Standard Quality

Waterloo Boy fully sustains the quality-fame attained by Waterloo Boy power machines in 25 years' manufacturing success. Backed by a plain guarantee from a responsible manufacturer. Two-speed motor supplies ample reserve power for tillage operations, and belt power for all farm needs, including threshing. All working parts of the Waterloo Boy are easily accessible.

Our illustrated catalog contains convincing proof of Waterloo Boy success. Sent free—write for it today.

Orchard-Vineyard Work
THIS TRACTOR'S SPECIALTY
Reasons in TrackPULL Book

MOST makers make a general-use tractor. We make a special kind, after 34 years' experience in building orchard and vineyard machinery to meet special needs.

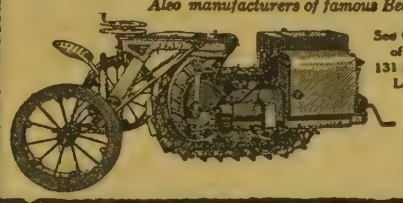
The Bean TrackPULL Tractor will be as famous as the noted Bean Power Sprayer when as many are in use.

Don't buy merely "a tractor" until you know the TrackPULL's special orchard and vineyard features. When you learn all the facts you'll decide

at once that a "general-purpose tractor" will not do.

BEAN TrackPULL Tractor

The TrackPULL turns in a 10-foot circle with full power — tools deep in the soil. You turn back in the same row. No getting out. No stopping.

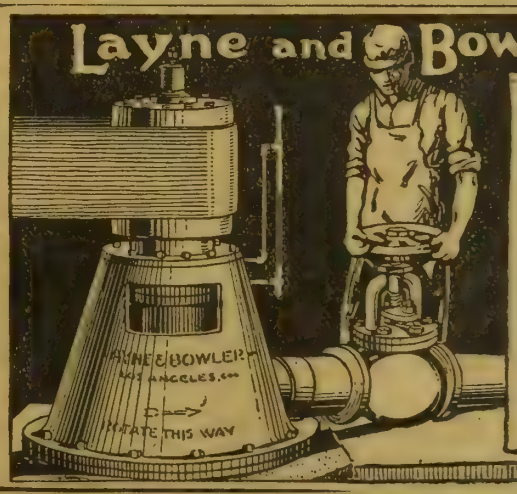


Its low height gets under branches four feet off ground.

Makes no difference how far off-center tools are hitched.

New "After-the-War" Proposition

We have a new "After-the-War" proposition which includes a bond covering a liberal guarantee on one season's work of 90 days, without expense for repair parts. This guarantee bond is furnished each purchaser of a BEAN. A reduction in price is also effective at once, and guaranteed up until June 30, 1919.



Also manufacturers of famous Bean Power Sprayers

See this Tractor at either of our Branch Houses 131 N. Los Angeles Street Los Angeles, Cal., or Fresno, Cal.

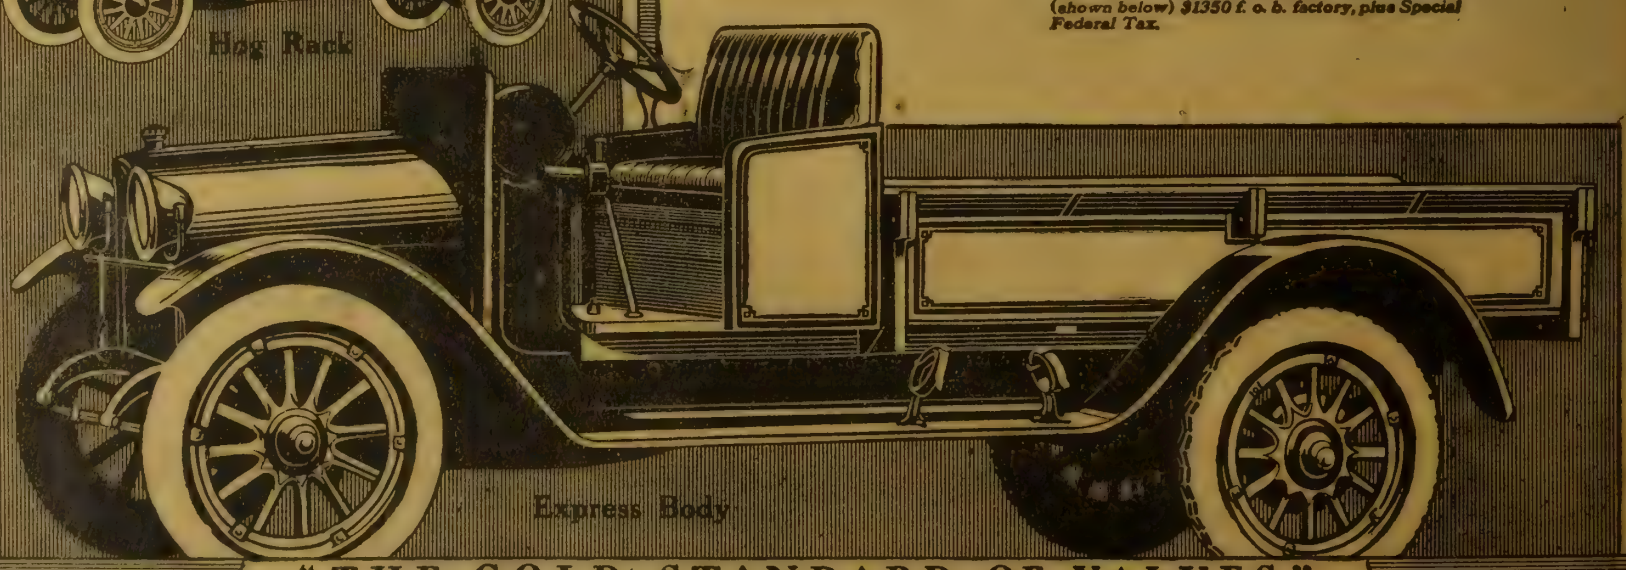
REO

Passenger Car or "Carry-All"



Top Box—"Grain-Tight"

Truck Gardener's Van

Hay Rack

Express Body

Another Triumph for Reo Engineering

There has existed a great need for a more adaptable motor truck.

The need was not for a chassis, for the Reo "Speed Wagon" had proven, in several years of use, that this chassis is ideal for every class of farm hauling.

But there was great demand for a body that would enable you to carry a maximum load of any commodity regardless of its density.

Many attempts have been made to develop a body that would be readily convertible into several practical forms.

Some of these have been successful to a degree.

Fault with all of them, however, was too much complication—too many adjustments and connections to get out of order.

Such construction also ran into a lot of needless weight to be carried all the time.

It remained for the Reo engineers to solve the problem in the simple, direct, substantial Reo way.

And they did it, not by making a convertible body that would fold first into one form and then another, but by a set of sectional units with one basic body as a foundation.

This basic body itself performs fully fifty per cent of all delivery service.

No user will need all the extra sections.

Each user will, however, need one or several of them.

You buy the Reo chassis equipped with the basic—low express—body shown below.

Then, to fit your special service, you select such other attachments or sections as you find most applicable to your work.

This Reo body in its several forms meets every requirement of speedy, economical hauling—in city and suburban as well as rural service.

There are seven forms in all.

On the left we show four forms of this body.

The other forms you may obtain at a few dollars extra cost.

Need we add that the chassis on which these body types are mounted has been longer in service and has been more conclusively proven than any other?

It is, in fact, the pioneer of its class—the first motor truck to be mounted on pneumatic tires.

Also, lest you forget; Reo was the first to see the need for, and to equip a motor truck with electric starter and lights.

The very classification "Speed Wagon" was original with Reo.

This Reo proved the superiority and the greater economy of the pneumatic-tired truck.

In operation and upkeep cost this Reo easily surpasses all others.

And so it should—for it represents the ripest experience and the soundest engineering known to the industry.

Your own Reo dealer will show you this versatile Reo "Speed Wagon" with the seven styles of bodies and quote you price on such as you may select as best suited to your own requirements.

Demand is—tremendous. Always is for Reos, but this season more so than ever before.

Only way to be at all certain of getting a Reo "Speed Wagon" for early delivery is to place your order at once.

Today won't be a minute too soon.

Reo Motor Car Company, Lansing, Michigan

Price—Chassis equipped with low Express body (shown below) $1350 f. o. b. factory, plus Special Federal Tax.

Forbidding to Fruit Trees; Inviting to the Beauty Lover

BEAN POWER SPRAYERS

Why is the Bean the choice of growers all over this state, and throughout the fruit-growing world? Ask any Bean owner, he'll tell you the details about these

10 Big Distinctive Advantages

1. Patented Pressure Regulator, safest, most dependable, and best ever devised.
2. Threadless Ball Valves, which cannot rust, corrode or stick tight.
3. Porcelain-lined Cylinders.
4. Underneath Suction.
5. The Bean Pump, which has no stuffing box.
6. Eccentrics, which are used instead of cranks.
7. One-piece Steel Bedplate.
8. Bean Rocking Bolster.
9. Reliable Novo Engine, sturdy, reliable, without trouble.
10. Bean Re-filler, which fills a big tank in five minutes, or less.

THE BEAN SPRAY GUN makes the largest power sprayer a handy one-man outfit.

American Centrifugal Pumps

When it comes to downright dependability, for day-in-and-day-out service, American Pumps are in a class by themselves. They DO THE WORK!

Combination Elbow and Check Valve

Practically eliminates priming. Order it with the American pump, or can be supplied for the pump you now have.

Write for Catalog of Centrifugal Pumps

If your water problem can be solved with any pump, it can be solved with an American. These pumps are designed to meet every possible condition. They get the MOST water at the LEAST cost and with the LEAST TROUBLE. Put your irrigation problems up to irrigation experts. Also write for Catalogs of Motors, Gas Engines, and Oil Engines.

AMERICAN PUMP COMPANY

The Commercial Value of Beauty

By Ernest Braunton

I'VE often wished that I had clear,
For life, six hundred pounds pounds a year;
A handsome house to lodge a friend;
A river at my garden's end;
A terrace walk, and half a rood
Of land set out to plant a wood.
—Jonathan Swift.

Thus did the brilliant Dean Swift, best known to young and old as the author of Gulliver's Travels, bemoan his fate, a few years before the year 1700. He died quite wealthy, however, and possessed ample means to gratify his expressed desire for a fine country home. This longing for a quiet and pleasant home in the country comes to all men at some time of life. The bustling captain of industry yearns just as strongly for such a refuge as those in other walks of life, but usually he waits until hard business cares and advancing age force him to desist, and he then, for the first time, turns to look for repose in a home as far removed as possible from the scenes of active business life. To such a retreat he may have gone, on occasion, when near a breakdown from weight of cares and woes incident to every busy life. He may have taken time by the forelock and provided a charming rural home, but the percentage of those making such provision is indeed small.

The question then arises: Where? Where will he spend his declining years in the midst of peace and comfort? Where may he get the greatest amount of joy and recreation every day in the year? He has been a busy man six days each week for long years. He must still be busy every day in the year. To coop such a man up in a house for the duration of a long Eastern winter is to send him to his grave in a comparatively few years. He must find a climate where he may enjoy outdoor life at all times, in that period of life that Burns describes as "When bones are crazed and blood is thin." The hand of destiny points to California, and here he comes. Herein has been pointed out the brief life history of but one class, but all share in common that desire for peace and comfort and much enjoyment toward the end of life. For he spoke truly who said, "Once a man and twice a boy." This boy of mature years will seek a home as good as his purse will provide. He will seek it in the best climate he can find. He will go to that country or state reputed to be the most beautiful and most enjoyable. Arriving there (which is here) he will look for a section given over to beautiful homes. (In California he will find some everywhere.) He will either purchase a home fully equipped or a suitable site either with or without a house. Thousands of cases may be found where a beautiful rural site has been bought that has for years been occupied by a farmer of very ordinary means but who has had the foresight and taste to plant trees and shrubs in proper place and order. The old house has been moved back for the occupancy of manager, superintendent or other help and a fine residence erected in its place. The site is all that was considered at the time of purchase. I wonder how many of my readers have a fine site, but little means with which to improv it.

The cost of beautifying fine building sites is not heavy. It is not expected if you are looking merely for an investment that you will build ponds, garden houses, rockeries and put out a great flower garden to make a heavy annual expense. These will, each and all, add to the value of the place and to your own enjoyment of the same, but for the moment we are considering an investment of a limited amount. All of the things listed may be built in a year, but trees and shrubs require many years' growth before they are effective in the landscape or provide a proper and attractive site for a fine rural home. If, then, we offer no other advice, let all plant trees and shrubs so that, while ministering to your own pleasure and comfort you may build that that will have an ever increasing commercial value. Many years ago, by request, I wrote an article for the Cultivator entitled: "A Landscape for a Dollar." I had in view the bare building sites now far less common in California—not a tree, shrub or flower to be seen. I told how a box of blue gums, at an investment of one dollar, could be planted about the house and other buildings, and made to provide shade, shelter and an anchor on the general landscape that would proclaim the place a home site. The notice taken proved the article struck a responsive chord. But the first comment was from a well to do business man of the city, who said: "I don't believe many ranch owners of California who live on their own place are so devoid of taste and foresight as not to provide shade and shelter afforded by trees, but I have two ranches occupied by tenants where I can see I could mightily improve them by spending a few dollars for small trees." A rancher wrote: "I fear you have misjudged the standard of the Cultivator readers. The man who could improve his place by spending one or a few dollars does not take the Cultivator and therefore you did not reach him. His numbers are few anyway; give us something a little higher up the scale." But the article opened the eyes of all to one fact, evidently overlooked: that even one dollar, rightly applied, will improve a place, run down, or insufficiently supplied with shade or shelter, or both. It also emphasized the fact that but a small expenditure is needed, based on good judgment, to make any place more attractive, and therefore of greater market value.

Save the Oak Tree for a Beauty Spot on the Ranch

Monster oak on the ranch of Dr. F N. Reasoner, Guinda, Yolo County. The circumference of the tree four feet from the ground is 28 feet and one inch; 16 inches from the ground, 36 feet and four inches; height, 99 feet; spread of branches, 121 feet.

Courts of law have always placed a high value on ornamentive vegetation into which decisions age has largely entered. Where fires have been allowed to get beyond control and destroy trees and shrubs only, the awards have run into thousands. A single tree has been adjudged to be worth a thousand dollars. A few years ago, in Los Angeles, a street was to be cut through private property. Within the proposed street line there stood a tree known as Pircunia dioica, which experts agreed in court was worth six hundred dollars. I was not one of the witnesses at that trial, but was present, and much as I love trees, I would say no tree of that species in California is worth that sum. But it was a rare species in those days. Such decisions nevertheless prove that trees have a heavy value in the eyes of the law. A visitor from Nebraska, looking at a large palm in my yard, said: "If I buy a home here, I would give five hundred dollars more for a place with a tree like that." A Pasadena Avenue, Highland Park. It man and wife last winter arrived from the East during the night and were taken in a taxi to a friend's house on was their first visit. As they left the conveyance they walked toward a fine large specimen of this Canary Island palm. They walked round and round the tree, forgetting their friends and relatives inside, and uttered such exclamations of wonder that a man and wife living next door came out to see what was wrong, but found all was right. Curiosity may prompt many to so express themselves, hut this newcomer said: "No wonder California homes are high in price when they have such things growing outdoors in the front yard." This speech was reported to me by the man who was called out by the exclamations of wonder and admiration. A place on the corner of Figueroa and Twenty-third Streets was a few years ago purchased by a man at present a state official. He stated he gave $5000 more for the place than he otherwise would have done, because of the presence of two of these large palms in the front lawn; and they are two of the finest in the city. But is it necessary to present argument as to the value of trees and other plants? I think not; for all over California instances are known of heavy monetary considerations being given in the purchase price where finely decorated grounds surrounded the house site. That nearly all are impressed with values is evidenced by the very few indeed who do not beautify.

But why do all so value ornamental vegetation? First, because it is natural, just as much a part of nature as ourselves, but in a far more primitive or natural state, and one of the very foundations of the world, so far as man is concerned. It is part of that nature of which man is the highest expresson, and, try as we may, we cannot resist the call of nature. For are we not, in common with the tree, a part of creation? The tree is not of our creation, therefore is it a fellow creature and the love for it but a natural expression. We surround ourselves with the beauties of nature in order to get the greatest enjoyment out of our homes and lives, while

OUR ADVERTISERS RELIABLE

We guarantee our subscribers against loss through dishonesty of any advertisers in the Cultivator. We do not attempt, however, to adjust trifling differences between subscribers and honest, responsible advertisers, nor will we pay the debts of honest bankrupts. Notice of complaint must be sent us within 30 days from date of the transaction, and the subscriber must have mentioned the Cultivator when writing the advertiser.

THIS WEEK'S COVER

The use which may be made of a piece of waste hillside is shown in the cover illustration. This view is on the place of Mr. Spinks in the foothills of the Sierra Madre. The mesa or rolling sections were used for orange and avocado planting and the rocky and more forbidding portions for the residence and grounds. And wonderful use has been made of these rocky hillsides.

If this place should ever be offered for sale we doubt not these beauty spots would add as much to the real selling value as the more immediately profitable fruit bearing trees. More general discussion of the subject of the commercial value of beautification of the ranch or home place is given in the article on third page of this issue.

HIGH FINANCING HOGS

One of our readers writes to inquire whether we would advise investment in any of the so-called hog raising syndicates, companies or associations offering stock for sale to the California public.

He refers to one outfit that agrees to sell a sow, care for her and her litters (she is to produce two litters, averaging six pigs, a year), feed them and deliver half the produce weighing about 200 pounds at six months, to the investor without further cost. All of which sounds very good if they could make good their proposition—but they can not.

Hogs can be raised at a profit and when properly managed will make money for the producer, but there is no possible way to produce 200 pound hogs in six to eight months at a cost per pound that would enable any concern to give an investor half of the hogs free of cost and stay in business.

In order to make good, the company would have to charge the entire overhead, feed, labor, equipment, insurance, etc., to their half—thus increasing their production costs 100 per cent.

California has a blue sky law that is supposed to head off wild cat, get-rich-quick propositions and it strikes us that it could be applied to these concerns.

Heretofore these outfits have been "getting by" through the fact that they have not offered stock, but have operated on the unit plan, but one layout has just been issued a permit to sell stock. Our advice to our readers is to put their money in the next Liberty Loan—they will be safe and net more than such schemes.

BEANS

With prices for California beans dropping daily; with Japanese beans being daily landed at Pacific Coast ports, our bean growers are asking why the bean market has been handled as it has this year.

We note that the Pacific Rural Press of February 1 presents, under the title, "The Bean Situation — An Explanation," a statement by the food administration office in San Francisco, of why the California bean grower is not receiving—and probably will not—cost price for his beans, which "explanation" may or may not soothe to rest the bean grower's apprehensions of failure. Here is the statement:

"All beans supplied to the United States army and navy are American grown beans. Imported beans have been bought by the government men for the allies and only on orders from them. These beans, which our government has been commissioned to buy for the allies, come to the United States in bond and are reshipped in bond."

The "explanation" in the Press ends with "Some of the foreign beans are brought in by importers, as they always have been, and distributed here. It is a legitimate business and there is no law to prevent it."

Perhaps it is legitimate and perhaps there is no law—neither ruling—to prevent it, but in view of the fact that Californians were appealed to to produce beans for food for ourselves—and for our allies—and have produced those beans at heavy cost, and the government agents (the United States Grain Corporation) have seen fit to make importations from China and Japan, even if they are later to be transported to our allies, the bean grower naturally has one big question, and that question is: If the ship builder is protected in his profits; if the wheat grower and the pork producer are given a measure of protection, why deliberately import beans at prices below the cost of production in California when warehouses are filled and the market flat? Note these quotations in the last two reports issued by the bureau of markets:

"Dragginess and tendency to declining values continue the chief characteristics of the bean market. About the only brisk demand is for export, the United States Grain Corporation having bought over 1,500,000 hundredweight for this purpose, but even in this outlet there was competition of Asiatic beans at lower prices." "Practically no demand or movement, very few sales, market weak. Practically all stock in growers' hands."

Mr. Serres showed in last week's Cultivator his cost production. Read it, then note quotations on market page this week.

SACRAMENTO STOCK YARDS

Announcement has been made that a $5,000,000 packing plant and stock yard will be established at Sacramento. Chas. E. Virden, one of the promoters, states that the necessary capital has been secured and that work on the project will start early in the spring.

In a published interview it was stated that all classes of live stock would be handled, and an open market would be made for live stock producers. There is little doubt but that an open market is a very vital problem in this state, but we are wondering if such a plant at Sacramento will correct the weak places in our present system.

We believe that the weakest points in the existing plan of marketing center around the fact that there is slight competition among the buyers for any particular lot of stock and that our markets, speaking generally, are not based on grades.

The reason we say there is slight competition is due to the fact that each packer receives his country consignments direct. If a central yard were established the shipper could send his stuff to a commission firm who would be in contact with all the buyers, and the killers would be on the market every day. Of course there is always the danger of price agreement, but we believe that enough independent plants are in operation to serve as a powerful check on the much talked of "Big Five."

Now granting that modern yards are established at the proposed Sacramento plant, would the situation be much different from that now existing? Practically, each packer is operating his own "yard" now and it is hardly probable that the established plants in the bay district or at Los Angeles would come to Sacramento to get their supplies. They might, but we doubt it. If they bought there the stuff would be unloaded and shipped to the home plant—and the added expense would be figured in the price. If all the plants could be moved to the proposed yards, well and good, but they will not be moved. Therefore would it not be easier to take the yards (which are only on paper) to the plants? Then if a new packing plant could be financed it could be built near the yards, and if operated independently, it would furnish competition.

We believe that the established plants would welcome a union yard. As a matter of fact some of them would like to finance such a plan if they could keep the contract. But the live stock producers want an uncontrolled yard.

We are not opposing a Sacramento yard and plant, but we doubt if the announced plan will afford much improvement over the present system, and because we believe that yards, without packer control but properly located so that they would be accessible to the greatest number of buyers, would prove a great boon, is our principal reason for questioning the soundness of the Sacramento proposition.

If the interests back of the proposed plant would enter either of the established centers, secure the cooperation of the producers and the other packers, build a modern union stock yards and erect their own plant, the live stock development of this state would be pushed ahead a good many years.

MARKETING

Many a farmer has concluded that the job is only half done when the crop is raised and harvested. The other half consists in marketing. Unfortunately that is often the end of the job least successfully done. The farmer who has spent his year combating the elements is in no position and has neither the information nor the training to combat the methods employed by many a shrewd dealer. Hence the necessity of cooperation and the employing of one thoroughly conversant with market conditions and market methods. But the purpose of this paragraph is not to discuss cooperation; rather one phase of marketing methods, that is, quotations made in this and other papers. These quotations are often entirely misunderstood and we fear sometimes purposely used to mislead and misinform rather than give a fairly accurate view of the market. In the first place there are some farmers who expect to turn to the paper and find the figure which they will receive for their pound of butter or pound of beef or other product providing they bundle it up and send it into market. Such market quotations will never be had. The best that possibly can be done is to give the range of prices and the conditions so far as possible under which those prices were paid, and then the farmer must use his judgment as to whether these conditions will prevail when his products reach the market. A good explanatory note is given in a recent bulletin sent out by H. H. Warner, Assistant in Market Surveys, in charge of the Los Angeles office of the federal bureau of markets:

The prices in the reports you have been receiving from this office have in some instances been misunderstood. The prices we report cover three kinds of sales, namely: Sales to Jobbers and Other Large Buyers; Carlot Sales, and Sales Direct to Retailers. All information represents actual sales made by original carlot receivers in these markets to jobbers or various buyers.

"Sales to Jobbers and Other Large Buyers" refer to sales in jobbing lots of the commodity in question when the car is first broken. By jobbing lots is meant wholesale quantities in which the commodity is sold by the original carlot receiver to the jobber and other large buyer, such as 25, 50 or 100 bushels, barrels, crates, dozens, baskets or other unit of container or measure by which the fruit or produce is sold. "Sales to Jobbers or Other Large Buyers" must not be confused with "Carlot Sales" or "Sales Direct to Retailers" in small lots.

By "Carlot Sales' 'is meant those sales made by the original carlot receiver in a terminal market to a jobber or other large buyer, who is able to handle his purchases in carload lots. In only the larger markets is this kind of sales consummated, and then only upon the more staple commodities.

By "Sales Direct to Retailers" is meant sales made by the original carlot receiver in small lots direct to the retail stores, peddlers, etc., in those smaller terminal markets where the volume of business is too small to justify the operation of a jobbing business as such.

In no cases do the quotations based upon any of these terms of sale represent prices paid to growers. For the grower to estimate what he should expect to receive for his product in a given market on a given day, he should consider the grade, pack, quality and condition of his product as compared with the bulk of that product reported for that day, and then deduct freight or express charges, commissions and other regular charges usually incurred in distributing such farm products.

Sales to jobbers or other large buyers are given in the market reports whenever available, because they more truly represent the actual market conditions. Sales of this character respond to increased or diminished supply or demand more rapidly than either carlot sales or sales direct to retailers, and are usually made the basis for returns on consignments after the usual deductions for expenses.

More About Bean Market---or Lack of Market

THE article by Anton Serres on "The Bean Situation" in the issue of the Cultivator of February 1, also the editorial in same issue, are calling forth comment on the part of bean growers in California. Of the 17 or 18 million bushels of beans produced in the United States in 1918 California produced close to 50 per cent. In fact, we have seen the statement that California produced 65 per cent of the beans of the United States.

Be that as it may, there are millions of bags of beans stored in warehouses and costing for storage and protection thousands of dollars. The people of Europe are hungry for beans — are actually starving—and yet the bean situation seems to be bantered between broker and big jobber until the growers are—some of them—discouraged; others good and mad.

Meantime the brokers are allowed to bring from Asia shipments of beans produced by cheap labor, and these are used to hold down the prices for California beans below actual cost of production, as was shown by Mr. Serres' article last week. Bean producers are smarting under the injustice which has been imposed upon them by these importations. In this matter of importations and production in China we refer to quotation from "The Bean Bag" on another page of this issue.

This is a California question and must be settled largely by California growers, and we believe it may be through cooperation, at least if our government will give some consideration to American produced goods. The rice growers have a committee in Washington appealing to congress for protection. The poultry people are confronted with the problem of importation of large quantities of cheap Chinese eggs and are also asking for protection of their industry. (See letter to poultry men in the poultry department of this issue.)

The rest of the country cares little for the affairs of the producer on the Pacific Coast; it is up to him to insist on justice and to inform the country what the injustice is in the present situation. The temper of the growers is well shown by an article just received from Knute Norswing. He says, in effect, in the following article: "Let's stop sitting tight and do something."

Knute B. Norswing

Editor California Cultivator: You have thousands of readers that are bean growers, and what you say about beans nowadays proves intensely interesting, because others too are getting interested in the predicament of the bean growers. The sooner these gentle rumblings develop into a substantial roar that producers, consumers, Democrats and Republicans, will take cognizance of, the better it will be for people who eat beans.

That was an admirable statement on the bean situation by Anton Serres in the February 1 California Cultivator. Anyone that has raised beans knows Mr. Serres has managed most economically, and even then, the beans cost to produce over eight cents per pound. The writer raised beans, too, but had to pay higher prices all along. Interest cost us six and seven per cent instead of his five per cent. Hay cost $23 to $33 per ton against his $20; threshing 75 cents per sack instead of his 50 cents, and so on. Surely Mr. Serres gets off easy on expenses for this season as any bean grower will know, and still the cost mounts to over eight cents per pound. Most of the 1918 crop cost nearer 11 to 12 cents per pound to grow than any other figure. Read the article again!

Now what is wrong? Is it not that we are not organized? Are we not now where the orange growers and the walnut growers were about 25 years ago? At that time the orange grower was lucky to get 25 cents to 50 cents a box for his fruit and the shippers got rebates enough to make them millionaires. The walnut growers got four and a half cents per pound for walnuts if they could sell at all. You say what has that to do with this? It shows the work of the broker before the orange and walnut growers organized. It shows precisely what these fellows, who produce nothing and render no real service, always do if they can get a chance. It shows exactly what they are doing to the bean growers today. Yes, and were not the raisin and peach growers in the same fix until they organized? Bean growers, we must organize or quit. We have to get away from these brokers, as the orange and walnut growers did, or they will get us.

In 1917 these bean brokers got the best of us by contracts. In early spring their agents combed the country to get contracts for beans. For 1917 crop we contracted at what we thought were good prices but, when threshed, the beans were worth about twice as much as they were contracted for. The brokers made millions. That was in 1917. What did they do in 1918? Not a contract. They were not heard of. Now the state council of defense urged us to plant, to produce food; and the experiment station suggested that we in such an emergency plant beans between the rows of trees and so on. We did. The market reports from the bureau of markets, Los Angeles, show that thousands of tons of Jap and China beans have been coming to Seattle and Tacoma this fall and winter and are shipped east. Certain it is there is a market for these Jap-China products. There is not for ours. Possibly the brokers are getting the Jap-China beans for little prices so they clean up their millions on them this year. Are we holding ours until they have their oriental products sold?

But you say you have an organization. Is that so? Where is it? What is the street and number? I have been growing beans the last six years and wanted to find a bean association but couldn't. But there is one. California Cultivator, February 1, explains it, and that it is going to "sit tight." Is their object, their purpose to "sit tight" now until the brokers' oriental beans are disposed of? Looks that way, doesn't it?

"Sit tight." Isn't that what they have been doing? Why don't they get out and "cackle" and sell the growers' beans? The warehouses are full of them. There are more housewives in this country and in Europe that want the good California beans than that Jap-China stuff. Give them a chance to get them. Don't "sit." Get out and "cackle," advertise how good, wholesome and cheap they are and move them. Find new uses for them. The Exchange for instance would find a way to make drinks out of them should that be necessary to market them, or Carlisle Thorpe would get up a cracking plant that would process the beans so confectioners would buy them to make fancy confections out of. The beans would be sold and without a slump in the market too. These fellows don't "sit" not even "tight," but are ready to "cackle" (advertise) on the slightest occasion. And things are merry and joyous among the orange and walnut growers. I belong to both associations, so I know.

And there is that state market commission. Does not that "sit tight' too? Has it ever "cackled" so a producer or a consumer heard it? Adios.

The Association That is Laying Golden Eggs

WE MAY deplore the fact that farmers are not as shrewd in handling financial matters as the money changers in the larger markets of the world. We fear it is true as a general thing, but there are certainly exceptions, for instance, the Poultry Producers of Southern California organized less than two years ago.

On a capital of less than $25,000 this association now has assets of $79,000 and did a business during the 12 months of 1918 aggregating over a million dollars. According to the report of President Davison:

"Your organization rendered its marketing service to 422 members. There were handled for these members 2,433,612 dozens of eggs, for which they received $1,089,410.24. It is very gratifying to be able to report that these eggs were handled at a cost considerably less than the two cents per dozen deducted for handling charges. Our accounts are now being closed, and as soon as the exact operating expenses have been determined, each of you will be advised of the total of such expenses, and of the amount of refund to be made to shippers, namely, the difference between the two cent deductions and the actual cost of operations.

"During the past season we have stored 43,304 cases of eggs, all of which have been sold, and have realized a profit from storage operations of $18,143.96. From this and the miscellaneous profits, your board of directors will recommend to you that you in turn recommend to the incoming board that a dividend be paid to stockholders. This extraordinary showing was made possible only because of our contract with our manager, H. W. Stanley, by the terms of which he was to finance the purchase of our eggs for storage purposes. An increased capital is absolutely essential to the future success of our storage operations."

Doing a business of over a million on almost no capital certainly calls for some shrewdness and no little nerve—nerve, because in this particular case credit was liberally used to the extent that if the market had gone absolutely wrong at one particular moment disaster would have come, not only to the association but especially to the directors who hypothecated their personal credit.

Not good business? Perhaps not, but it shows the determination on the part of some of our producers to carry through to success an organization which is being attacked or at least obstructed by "business tactics". But the venture has won, is winning, as was shown by the large attendance of the membership at the last annual meeting held last Friday.

This organization is the first to ship carlots of eggs and broilers to New York City markets. It has taken the eggs at a time when they were becoming cheap here and saved them from storage and put them into a far better market and not only made money for its members, but has cleared the market so that all local poultry producers have benefitted.

On this particular point President Davison, in his informal talk at the opening of the annual meeting, remarked that if these eggs had been pressed on the local market without the relief secured from shipping to the East in carlots, he had every reason to believe it would have resulted in the taking of at least six or seven cents less per dozen on every dozen marketed in Southern California.

Besides these shipments, when the Eastern market becomes indifferent or when prices drop below the profit point, then cold storage is resorted to and, as noted in the quotation from the president's address, thousands of cases are stored until the higher prices of the next fall. Our local producers are looking with regret at reports of thermometer readings in the Eastern centers at the present moment. The Eastern winter has been exceptionally mild and Eastern hens have generally shown little respect toward California hens and gone on laying, so that little call is made for California produced eggs. This has resulted in a slump in the New York market, the price being shaded daily, some days to the extent of over seven cents.

The success achieved by the association has not been due to the accident of good markets so much as it has to the standardization and delivery of honest goods honestly marketed. On this point Manager Stanley made a strong appeal to producers in the matter of delivery: "Don't wash eggs." "Don't even wipe off." "If they are dirties, let them take their proper place." Of course when classed in the lower grade the price is shaded, but perhaps not more than one cent per dozen, but when washed and accidentally slipped into another case which goes into cold storage, the loss may be far greater.

Connected with the marketing association is a supply association. This is conducted on an entirely separate financial basis and as yet has no capital. It is only handling feeds and supplies for members who advance the cash for every purchase. It is hoped this will be placed upon a more solid basis.

Directors are elected from various districts of the southern portion of the state. Los Angeles County has five representatives. They are: Pomona, C. G. Ross; Van Nuys, B. R. Holloway; San Gabriel, A. J. Neimeyer; Gardena, A. C. Olsen; Burbank, L. W. Prewett. Riverside County's representative is J. M. Davison; San Bernardino County, T. C. Browning; Orange County, W. L. Grubb; San Diego County, T. M. Hurley; representative state market director, Austin O. Martin. These directors elected officers as follows: President, J. M. Davison; first vice president, W. L. Grubb; second vice president, B. R. Holloway; secretary-treasurer, L. A. Brooks. The directors also elected the following as executive committee: C. G. Ross, B. R. Holloway, A. O. Martin. The attorney for the association is Judge Willis T. Morrison.

Agricultural News Notes of the Pacific Coast

Northern California

Turkeys are bringing Yolo County growers some long prices.

Glenn County reports many applications for national farm loans.

Ukiah reports sales of 70,000 pounds of hops at 19 and 19½ cents.

Prof. E. C. Voorhies is again at University Farm after service in the trenches.

Sacramento Valley bean growers are getting impatient over market conditions.

Hayward, Alameda County, is now one of the largest shippers of fresh vegetables.

The biological survey now has three official coyote and lion hunters in the Trinity national forest.

Vegetable farmers throughout Alameda and Santa Clara Counties have formed a marketing union.

Auburn, Placer County, olive growers are selling off their next crop to a packing concern at Corning.

The 11th annual meeting of the California Sheep and Wool Growers' Association was held at Davis, January 22.

The forest service has been grubbing out poisonous larkspur on the ranges of Pyramid Peak in the Eldorado national forest.

The El Dorado farm bureau association recently elected officers for the coming year. F. W. Goff is president and John Harris secretary.

The state fish and game commission has a fish hatchery in Inyo County which is giving a large quantity of young fry to the streams of the Sierra Nevada.

The irrigation and drainage system installed at the state land colony at Durham was recently inspected by Frank L. Adams, federal irrigation expert stationed at Berkeley.

The state legislature is to be asked to send a memorial to the tariff commission urging that the tariff of six mills on Japanese rice be raised to at least two cents in order to protect California growers.

H. C. Dunlap of the California Prune and Apricot Growers' Association reports that he found both the governor and the state board of control favorable to the proposed state appropriation of $150,000 for experiment work in nut and deciduous fruit culture.

Humboldt County and the federal government have completed arrangements whereby each will pay half the cost of constructing seven miles of road connecting the Klamath River with the Salmon in Siskiyou County and thereby open direct communication with Eureka and the coast.

Capitalized at $5,000,000 a stockyards has been erected at Sacramento. The company is headed by Charles F. Virden, president of the Sacramento chamber of commerce and of the California Fruit Distributors. A meat packing plant in connection will be established in West Sacramento.

Manager Barber of the Poultry Producers of Central California has informed members that Chinese eggs are coming in by the shipload since the war stopped and urges them to write their congressmen and senators insisting on a protective tariff on the Chinese eggs that will enable the American poultrymen to make a living profit.

Central California

Lindsay, Tulare County, has shipped 1000 cars of navels.

Watsonville Creamery is now making record shipments of butter to San Francisco.

Squirrel extermination is the effort of a large district near Chowhilla, Madera County.

Prof. F. T. Bioletti has given olive pruning demonstrations at several points in Fresno County.

Apple growers of the Pajaro Valley are hoping for the passage of the new standard apple pack bill.

The farm center at Ducor, Tulare County, recently met and discussed plans for the next year's work.

A recent auction sale of dairy cows in Tulare County averaged $115, the higher priced cows going at $157.

A Fresno County fig grower reports the nematode a serious pest on the roots of some recently planted trees.

The planting of Tuscan and Phillips Cling peaches in the San Joaquin Valley has been more general than for years.

Merced County's sweet sorghums for forage yielded so heavily that the planting for the coming season will be extended.

Watsonville is shipping out storage apples rapidly and there is considerable movement of dried apples also from that point.

Pajaro Valley apple growers are contemplating an 80 cent per hundred rate on apples to New York by way of the Panama Canal.

Prof. J. E. Doughterty of the University Farm gave an address at meeting of poultrymen, Tulare, February 3. The topic was "Feeding for Egg Production."

Cotton men of the San Joaquin Valley recently met in Fresno and discussed cultural and marketing plans for the coming year. The planting in the valley will be greater than in 1918.

County Horticultural Commissioner Roulard of Fresno is giving demonstrations in spraying of peaches. Motion pictures have been taken of these demonstrations within the last week.

A Fowler, Fresno County, raisin grower has invented a dryer which enabled him to save 84 tons of wet raisins after the fall rains. The dryer is 24 feet long, 20 feet wide and ten feet high.

The fourth farm bureau hog auction of Merced County was successful, the first car selling at $16.10 per hundred. This was one dollar above the buyers' offering to ranchers the day preceding the sale.

Stanislaus County dairymen met in Modesto Saturday, January 25 to consider oleomargarine legislation and to appoint delegates to the annual convention of the California Dairy Association at Sacramento.

The bureau of soils of the United States department of agriculture and the University of California united in making a soil survey of the lower San Joaquin Valley. A report of this survey is now being issued.

The board of supervisors of Tulare County has decided to secure the services of an experienced citrus culturist to give advice to orchardists whose trees are showing lack of best thrift and health. He will be under the direction of the farm adviser.

Southern California

The bean market is generally looking up.

Redlands shipped about 1000 cars of navels.

Imperial Valley has a 600 acre wheat field.

Brawley, Imperial County, is shipping carlots of spinach.

The Escondido cannery put up a total of 75,000 cases of tomatoes.

There were 80 students enrolled at the recent tractor training center at Hemet.

Imperial Valley growers of Pima cotton are discouraged because of the extreme slowness of the ginning.

Riverside and San Bernardino Counties beekeepers recently met at Riverside and held annual election.

The marmalade factory at San Dimas is now employing 170 workers, turning out 114,000 jars of marmalade a day.

W. L. Russell of Garden Grove, Orange County, reports extension of orange planting in frostless Garden Grove.

A lemon and orange packing house is to be built for the North Whittier Heights section on the Salt Lake railway.

Riverside County's greatest crop is citrus fruits, $3,500,000. Alfalfa is a close second, however, valued at $3,250,000.

Artesia, Los Angeles County, claims the erection of more silos during the past season than any other section of like scope.

The California Lima Bean Growers' Association recently filed an order for 2,860,000 pounds of Limas at $10.15 per hundred.

A plan of organization of mutual water companies in Oceanside, San Marcos and Vista is being perfected, the water to be brought from the San Luis Rey River.

Frost protection will be the question discussed at the coming citrus institute at San Bernardino, February 20 and 21, in conjunction with the National Orange Show.

Senator King has introduced a bill into the state senate making provision for the formation of a district organization which will provide frost insurance for citrus districts.

Imperial Valley citrus growers propose to make an exhibit at the National Orange Show. In addition bolls of cotton will be given as souvenirs to attendants at the show.

Walnut growers of Southern California are asking for an appropriation of $10,000 to be used by the University of California to investigate methods of control of the codling moth or worm affecting growing walnuts.

Riverside County farm bureau is furnishing waste balls for use in the application of carbon bisulphide to squirrel holes at cost, which is about 45 cents per hundred balls. The carbon bisulphide is furnished at 35 cents per quart.

Irrigators who have filed request with the state water commission to store waters in the upper San Gabriel and San Dimas Canyons have withdrawn these applications and filed new ones asking permission to divert flood waters below power diversion. It is possible the storage may be secured in Puddingstone Canyon reservoir.

The Coast and General

Cablegrams from England indicate exceptionally strong apple markets.

Tractor schools are being conducted by the state college of Washington.

Sugar beet growers of Colorado received $9,000,000 for sugar beets last season.

The national forests of Arizona will spend $54,410 for roads during the next fiscal year.

It is expected that the work of all draft boards in Arizona will be completed inside of a month.

The Arizona Live Stock Sanitary Board is planning a revision of the 20,000 brands now on record.

The "Produce More Food" slogan of war times has resulted in a vast increase of irrigated lands in Utah.

Arizona may have a special term of legislature in order to consider fully the matter of the state highway system.

It is expected that the Grand Canyon National Park will have an extensive system of highways similar to that of the Yellowstone Park.

A concrete highway between Mesa and Tempe, Arizona, is being built and will probably be completed in about 60 days. The road is 18 feet wide.

The water table in the city of Phoenix, Arizona, is to be lowered by tiling. A complete gravity drainage system for the city will cost, it is estimated, about $125,000.

The L. L. Bates Cattle and Land outfit in Yavapai County comprising 1000 acres of land and 800 head of cattle has recently been sold to Wm. Wilkinson of Bethany, Illinois, for $60,000.

Colorado has a law permitting the formation of pest districts within the boundaries of which is permitted the cooperative effort to control grasshoppers, prairie dogs, ground squirrels or other pests and diseases.

Architects are now working on a plan for a new court house for Maricopa County to cost $500,000. Funds for building this will be secured through the sale of bonds and an election may be held at an early date.

The Phoenix, Arizona, chamber of commerce has requested all farm organizations in the Salt River Valley to appoint representatives to form an agricultural committee to discuss legislation needed by the agricultural industry.

The Arizona state game warden Joe E. Prochaska states that "predatory animals constitute the greatest menace to game in Arizona." He says further, "mountain lions, cats, wolves and foxes destroy more wild game than all the hunters."

Governor Campbell of Arizona has recommended that an agricultural building be erected on the state fair grounds. The governor says that the state needs and the great agricultural industry deserves a large fire proof building at the fair grounds.

The Water Users' Association composed of more than 4000 land owners in the Salt River Valley of Arizona has arranged to furnish all members of the association with cement and lumber for the improvement of irrigation ditches, building checks, etc., at wholesale rates, material to be supplied from the warehouses of the association.

Grafting Over Peach Trees

Written for California Cultivator By Claud D. Tribble

THE question is often asked: "Can a peach orchard be successfully grafted to other fruits?" All advice on this subject is to discourage the inquirers. Why?

We have grafted over many peach trees, ranging in age from four to 20 years, with perfect success. If the work is properly done there is no excuse for failure. To begin with the tree must be grafted as low as possible. In most California orchard practice trees are headed back at 18 inches or lower and three laterals are branched at this head. We saw off these laterals about eight inches or less above where they start from body of tree, and use the frame pruning saw to cut off and saw for the cleft, cutting out the cleft with a half circle harness knife and cut scions to fit or cut out cleft according to size of scions used.

Under no circumstances split a peach tree for cleft grafting as the center will decay no matter what precautions may be taken, and as we use three or more scions in each limb splitting could not be done, and care must be taken to place one of these on the southwest side of each limb grafted to bring up sap on this side as it tends to resist sunburn.

When our tree is grafted and carefully waxed, we wrap every portion of trunk, limbs and above the wax with burlap or other cloth and tie or tack it to the limbs and at bottom. If this is followed the owner will have a full bearing orchard in three years when he would have to wait six or seven years to attain the same result if he had pulled out his trees and planted nursery stock.

A peach orchard that has reached its decline can be grafted to prunes, plums or apricots and made profitable for many years, even though the trees have been sunburned so badly that they have decayed and broken off. In our experiments we have grafted side suckers from base of trees that had broken off at the ground and in four years we had trees of plums, apricots and almonds larger than the original trees which were approximately 20 years old when grafted. In one instance where a tree had died back to the ground a sucker was grafted to an almond and this tree is now over 25 feet high.

Another method of grafting the peach (also other fruit trees) is not to cut off the tree the first season but saw in the side of each limb at about the height mentioned. In sawing make a diagonal cut of about one and a half inches and three inches long and use half circle harness knife to cut out the cleft. In all instances where the saw is used in making the cleft the scion must be tapped in lightly so it will hold. It is well to make clefts on the inside of the tree as the scions will be better protected from being knocked out. In peach trees grafted by this method the first year there should be an average growth of six feet from each scion. The season following the tree can be cut off just above the union, the cut waxed, grafts properly pruned and the tree wrapped as before mentioned, and the job is complete. In expetimenting with new fruits we have grafted over peach trees as many as four times and these trees are still in good condition.

When a peach orchard begins to show signs of sour sap trees can be cut below the ring of sour sap, grafted to any variety of prune or plum, the tree saved and a good orchard result. Sour sap rarely goes below the surface of the ground more than four inches and does not affect the roots till growth starts when the air is cut off by the ring of dead cambium or sap layer. To get best results the tree should be grafted as soon as it shows signs of sour sapping.

ELIMINATING WALNUT MOTH FROM SACKS

We recently made note regarding Mr. Mackie's recommendations that the walnut moth may readily be eliminated from walnut sacks by running between heated rollers. The Anaheim Walnut Growers' Association has, during the past season, followed the plan of destroying every form of insect life in their orchard sacks by heating in steam chest. The sacks are placed in small bundles on shelves and dry steam released under them. The actual cash cost, not including labor, for sterilizing these sacks is not over $25 for the entire season. In addition to this there has been spent a few dollars, less than $100, for setting up the steam box and pipes which will be in use for years. This simple outfit has processed 13,000 sacks. The account of labor has not been kept because of its being done at odd moments by the regular help in the packing house. In any case it is estimated that the entire job would not require more than two days of one man's time.

Frosted Fruit

THE amount of frosted fruit is still a matter of conjecture, at least of very rough estimate. Water separators are being installed and the weather has been favorable to making the frosted fruit prove its own case, so that separation will be fairly accurately done. Deputy State Horticultural Commissioner Geo. P. Weldon has made examination in the citrus districts and makes the following notes on his observations:

A trip through some of the frosted sections of Los Angeles, Riverside and San Bernardino Counties, as well as through many packing houses where oranges are being packed at this time has furnished convincing proof that the damage to citrus fruits while possibly not as bad as the public feared immediately following the freeze, must not be minimized, and that the packing interests as a whole are recognizing their obligation to the industry and are packing fruit only from groves where the injury was lightest and from which the fruit will pass both government and state regulations.

While the packing interests as a whole recognize this obligation, there are a few money grabbers who would pack anything the color of an orange regardless of the condition within the skin. These few selfish individuals

La Crosse TRACTOR

IN buying your tractor think not only of today but also of tomorrow. The value of your tractor tomorrow depends upon whether or not it is standard today. This is the day of standardization.

The new La Crosse Tractor is the standard three plow tractor. It contains every feature which has made the La Crosse Happy Farmer Tractor so successful. It is the tractor which is up to date in every respect.

The tractor situation today is much like the automobile situation a year ago. The man who bought a standard automobile a year ago, can sell it today for more than he paid for it. To purchase a standard La Crosse Tractor today is to purchase a tractor which is not only the most practical type of farm machine but which is in addition a good financial investment.

12-24 Horsepower for $1250

The new La Crosse Tractor at its minimum rating offers you 12-24 horsepower for $1250, or practically one drawbar horsepower for every $100 invested. In the La Crosse Tractor you secure full three plow capacity under all ordinary conditions, with a guaranteed drawbar pull of 2000 pounds.

In buying a La Crosse Tractor you profit directly by the size and strength of this Company. Our immense buying and manufacturing power make it possible for us to offer you maximum power for the minimum price at which a successful tractor can be built.

The La Crosse is the real one-man tractor. You can run it, together with La Crosse Tractor Implements, single-handed. You can reach every working part of its engine from the driver's seat.

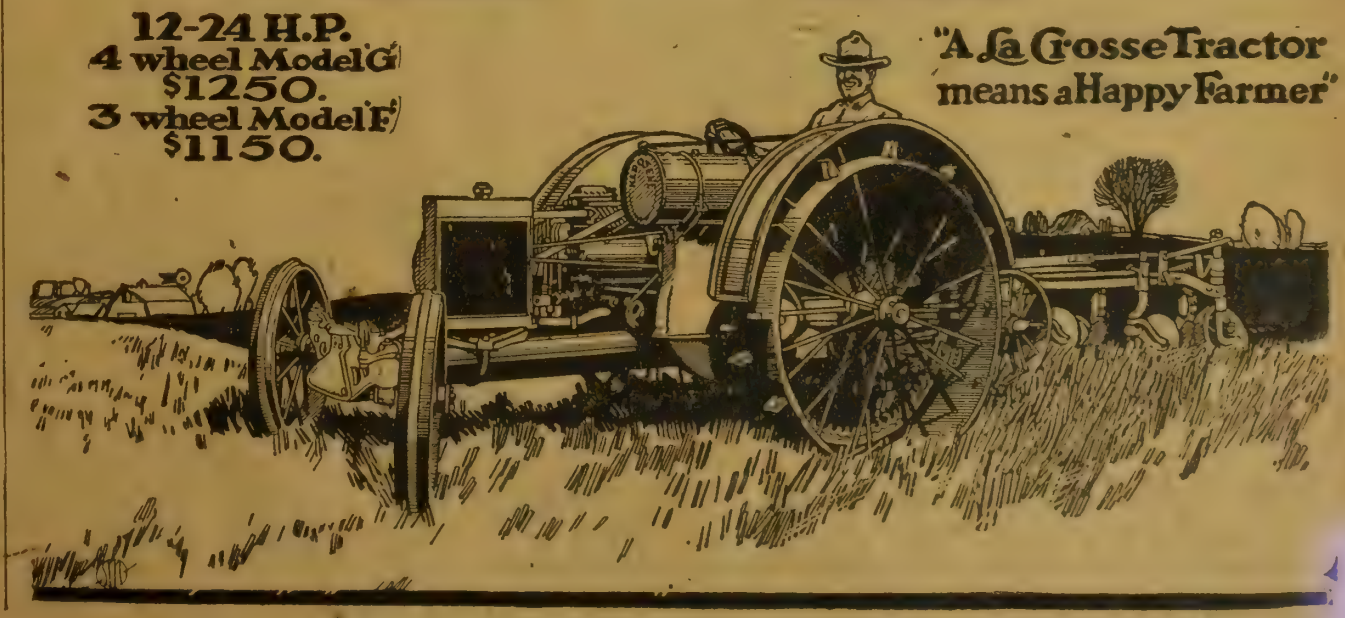
The La Crosse is the tractor which is self-guiding in the furrow and which turns in its tracks to right or left within a radius of nine feet. With its wide tread and perfect balance you can't upset it. Either front wheel will clear an obstruction 23 inches in height. Its double brake differential makes it especially fitted for hillside work.

The La Crosse Tractor is the perfect kerosene-burning tractor. It is exceptionally economical on fuel, holding the year's lowest average record for fuel consumption; does not overheat and is in every way reliable.

La Crosse Tractor Implements

The right implements are important. With your La Crosse Tractor, use La Crosse Tractor Plows, Disk Harrows and Power-Lift Grain Drills. All of them can be handled by the use of a rope from the driver's seat on the tractor. Ask your dealer to show you these well-made implements.

Write for Dealer's Name



The La Crosse Tractor means a Happy Farmer. It solves the worst of the labor problem, and makes farming easier, pleasanter and more profitable.

Write us today for the name of your La Crosse Dealer. You cannot see him too soon if you hope to own a La Crosse Tractor this season, as the demand for the La Crosse Tractor is greater than the supply. Write now.

LA CROSSE TRACTOR COMPANY

"A La Crosse Tractor means a Happy Farmer"

With the Return of
Peace and Prosperity
Plant
Teague Quality
Citrus Trees

With the present demand for feed stuffs, the return of peace and normal economic conditions there will be a growing demand for all orchard crops and a corresponding larger demand for nursery trees. Already this return is finding expression in an increased demand for Teague Quality Citrus trees, which leads us to advise intending planters to book their orders early, as the available supply of really good, bud-selected (pedigreed) trees is rather limited. For this reason we invite correspondence. Prices cheerfully furnished.

The R. M. Teague
Citrus Nurseries
San Dimas, California
FOUNDED IN 1889

The
Killefer
Automatic Double-Disc
Harrow

Killefer Effeicincy
Killefer Quality

Working Position

Without doubt this is the most important development made in the manufacture of farm tools to-date. This is the only Automatic Disc Harrow on the market. It was designed and built in our own shops completely. We are therefore the originators and have it fully covered by patents.

In the development of this, our latest triumph in Disc Harrows, we have not only maintained the greatest strength and durability as originally designed but have added additional valuable features, namely our

Automatic Shifting Device

controlled by the operator from the seat of the Tractor and a greater flexibility so desirable in a tractor disc harrow, but not found in other makes.

This Harrow is built in all sizes from 5 to 12 feet inclusive.

Orders should be placed now to insure delivery.

The Killefer Manufacturing Company
2209-21 Santa Fe Auenue Los Angeles

will come to grief just as surely as their methods will be discovered, and whether or not the country horticultural commissioner succeeds in his efforts to secure a prosecution, the red ink sales will disclose their short-sighted policy and condemn their dishonest practices.

For the present the state commissioner of horticulture will use every effort toward bringing about united effort on the part of the southern county horticultural commissioners in an attempt to prevent the picking of fruit from groves when considerable frost injury is apparent, until such a time as it may take for the cells to dry when the damage can be better known, and when the water separation process for the elimination of the frozen fruit may be applied effectively. In case it becomes necessary for the county horticultural commissioner to cause arrests for violations of the fresh fruit standardization act the office of State Commissioner of Horticulture Hecke will support the county commissioner when the evidence is such as to justify his stand.

From the National Orange Show

California citrus fruit growers are preparing the final details of their annual exposition, the Ninth National Orange Show. The exposition will open on the night of February 14 and will close on the night of February 23. There will be two Sundays and one holiday, Washington's birthday for the big days of the show.

The citrus institute, to be held February 20 and 21 is in charge of Dr. H. J. Webber of the citrus experiment station at Riverside. This will be of intense interest to growers for Dr. Webber is arranging an excellent program including some of the most prominent growers in the state. There will be particular reference made to frost damage. Dean Thomas F. Hunt of the University of California will be present and will deliver one of the lectures.

One of the elaborate features of the exposition this year will be the tribute of the California growers to the victorious conclusion of the war. A pageant of peace will be staged on a platform in the main fruit exposition.

Many districts, particularly in Orange, Riverside, Los Angeles, San Bernardino and Imperial Counties, are arranging extensive displays of their choicest fruits. The exposition will, in a measure, be a demonstration to the Easterners, who have arrived in large numbers all over Southern California, that the frost damage is not serious to the industry as a whole.

The decorative and illumination scheme will be brand new. One of the big features will be a court of victory at the entrance. Spanning the entire streets will be an arch and wall supporting Victory, mounted on the world, which is in turn supported by the California bear. The interior decorative scheme is entirely changed, and will center about great peacocks, the plumage of which will shine with varied lights. At night there will be a rainbow effect in indirect lighting throughout the exposition.

There is little change in the awards system this year, the most important being the adding of the grapefruit to the sweepstakes class. Sweepstakes honors will be given to Washington navels, lemons and grapefruit.

The industrial show will include all the latest devices in the care of the orchard and farm and the automobile show will demonstrate the latest models.

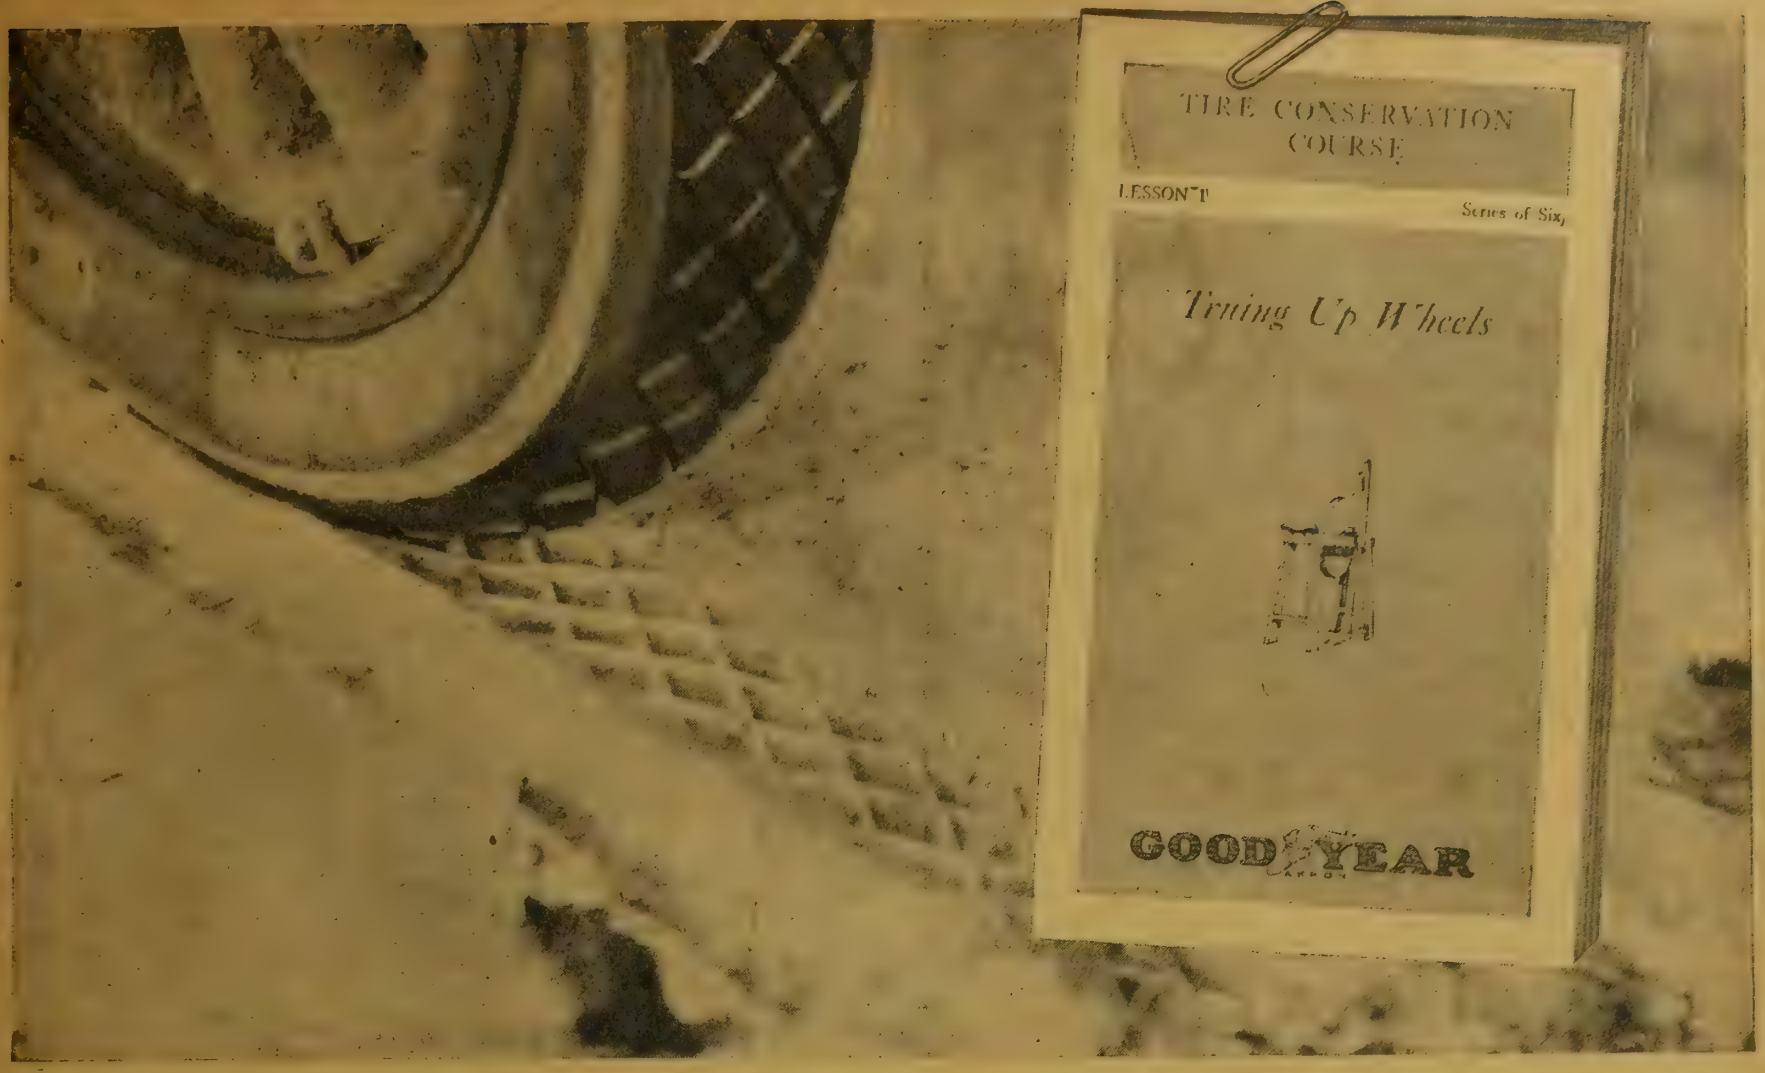
Tractor Course at Citrus Experiment Station

Registrations for the short course on tractors to be held at the citrus experiment station, Riverside, February 24 to March 1 are coming in rapidly. Applications are being received from all of the southern counties of the state and as far north as San Francisco and Oakland. The interest taken in this course would seem to indicate that the applications for enrollment will exceed the number that can be accommodated. This was the case last year when the enrollment for the course was 207 while fully 40 applicants had to be turned away as they could not be accommodated. For this reason, applications for enrollment are filed in order of receipt, when accompanied by the registration fee of $1.00.

Arrangements have been made for the following makes of tractors: Best, Cleveland, Fordson, Moline, Samson, Sandusky and Yuba. These machines will be available for demonstrations and practice work, while various parts and models will be used in the class room demonstrations. Class room work, for example, will be given on valve grinding, adjustment of carburetors, timing of ignition systems, babbitting and adjustment of bearings, while lectures will be given on all phases of traction engineering. This course is a practical one and will be of benefit to tractor operators and owners alike, and many owners employing tractor operators are taking out enrollments for their operators.

Application blanks and general information may be had by writing the Dean, Citrus Experiment Station, Riverside.

The lecture subjects cover practically every topic of gas engine principles and operation. In addition there will be demonstration and practice work in carburetor adjustment, ignition timing, valve timing, ignition troubles, clutch adjustment, gas engine testing, inspection and operation of several tractors covering several periods, belt lacing, babbitting of bearings, pipe fitting, rope and cable splicing, soldering, field practice with tractors, plows, and other tillage machines, forge practice, welding, sharpening plowshares.



Peaches in the South

Written for California Cultivator By Ernest Braunton

SOUTHERN California has much to learn about peaches. We do not grow enough; we do not grow a sufficient variety; we do not grow them good enough. Probably the most serious problem we have to solve is that of adaptability, in regard to varieties. In the South we have not experimented with the half a hundred sorts to be had, nor have we tried peaches out in all the southern sections. One Fresno catalogue now before me lists 43 varieties. The largest and best peaches I have eaten in California were at Newcastle, growing on rather steep hillsides. We have identical soil, climate, and other conditions in the South, while our canneries ship in trainloads of peaches annually from north of the Tehachapi.

A few days ago I called upon E. J. Kitterman, superintendent of the large cannery of the California Packing Corporation at Los Angeles. I asked him, first, what varieties he preferred. He gave them in their order of desirability as follows: Clings; Tuscan, Phillips, Sims, Orange. Sims Cling is a new one to this gigantic cannery, but Mr. Kitterman says it is apparently the best of all but he has received so few that he did not wish to be quoted as saying it is the best. In the freestones first came the Lovell, the grandest of all peaches for canning and the only one this firm

Saving 5,000 Miles
by "Truing Up" Wheels

A LARGE multi-cylinder car recently came to a Goodyear Service Station in Chicago with the treads on two Goodyear Cord Tires showing evidence of recent rapid wear. The tires had run 8,500 miles, but in the last few days the treads had been wearing down alarmingly. It was found that a recent accident had twisted the front wheels seriously, so that they were out of line. The grinding action due to this misalignment was cutting down the treads so rapidly that in a few days more the tires would have been out of commission. The wheels were re-aligned. The tires ran a total of more than 13,500 miles. 5,000 miles of tire wear were saved in this case by "truing up" the wheels in time. Have your Goodyear Service Station Dealer test your car today for wheel alignment.

ONE car in three has wheels out of line that rob their tires of thousands of miles.

Not even the Goodyear All-Weather Tread can long resist the grinding wear that such wheels inflict on tires.

They grind down a tread precisely as if it were held squarely against a revolving grindstone.

Misalignment is most common on the right front wheel, because it is most frequently run into ruts and gutters and against curbings.

On others a rim improperly applied, a bent steering knuckle, a worn bearing, or a warped axle may cause a like condition.

A misalignment of only three-quarters of an inch is enough to reduce by 5,000 miles or more the life of the best tires.

Only the most careful measurements can detect the condition.

Ask your Goodyear Service Station to inspect your car today.

Ask also for Lesson 1 of the Goodyear Conservation Course, dealing with the detection and correction of wheels out of line, so that you or your chauffeur can in future make inspections when you delay too long your calls at your Service Station.

Northern California

Written for California Cultivator By A. R. Gould

THERE is always plenty to do in this department as the subjects are so varied and many so hardy that even the frost does not harm them. Soon the Snowdrops and other bulbs will be showing through and the earliest of the flowering shrubs will be out in their full glory. Any plant moving, which is often necessary where subjects have been planted close together, should be carried out this month, and any new trees or shrubs which might be brought in from the nurseries should be planted. Every care must be exercised to see that the hole is dug large enough and the soil at the bottom loosened up to give the new fibrous roots plenty of chance, and where the soil is poor manure should be dug and mixed well in. Never plant too deep, but see that the ball or whole roots are covered. Newly planted flowering shrubs can be cut back but conifers should not be so treated. Always water shrubs immediately after planting and if you handle your plants roughly when planting or neglect them afterwards do not blame the nurseryman and above all do not buy cheap, small stock and expect it to produce large specimens in 12 months. Your home grounds are worth beautifying and are worthy of the very best, as choice shrubs and graceful trees add to the value of your property as well as making you feel happy in your home surroundings.

The Australian Bunya-Bunya
Araucaria Bidwillii from Braunton's Garden Beautiful.

Bulbs

A little bone meal raked in the surface of the beds and borders will help the bulbs, as also will a slight dressing of nitrate of soda. Gladiolus may be planted this month. There are quite a few named varieties on the market, good, bad and indifferent, and let us mention here that from our experience the higher priced are not always the best. Gladiolus have been developed to a high state of perfection in this country and owing to the fact that many varieties set seed so readily quite a number of new varieties are now in existence embracing almost every shade of color. They are easily raised from seed and some even flower in 12 months. The resulting "bulblets" or young seedlings are very small and need careful handling, but by growing these one can often secure a choice hybrid. The point desired in a good gladiolus is a tall spike, self supporting, with most of the flowers on the spike open at the same time. Their flowering season is not a very long one, hence they should be planted in a bed or border which is also planted with some subject having a long season of bloom. Gladiolus could be planted through a bed or border of gaillardia or myosotis. A few good named varieties of gladiolus are: America, light flesh pink; Peace, almost white; and Mrs. Francis King, one of the very best, light scarlet. Lemoines and Childsii hybrids give a good range of color and often many splendid types are secured from these strains.

Annuals

Many of these useful subjects should be sown at once on a finely prepared border of sandy soil in the warmest place in the garden. Among the best are the African Golden Daisy, dimorphotheca, clarkia Vesuvius, calliopsis, Tiger Star, browallia, dianthus lacinatus, godetia double pink, lobelia celestial, marigold, African and French, the fragrant mignonette, nemesia and nemophila. There are others which should be sown later as they are somewhat tender. Seeds should be sown very thinly.

Ipomeas

The morning glory, evening glory and the moon flower are all very popular climbers and most useful for covering fences in a single season. Seeds should be soaked a few hours before sowing, in pots or boxes of garden loam. Care should be taken in transplanting these to their flowering quarters.

Roses

These should be sprayed with Black

Leaf 40 if the green or black fly are in evidence on the young shoots. Sulphur should also be applied when mildew appears. Clean out all the dead wood and finish pruning.

Perennial Borders

Existing clumps of campanula, Michaelmas Daisy, heuchera, delphinium, etc. may still be divided and replanted. Your nurseryman can probably supply you with some newer types of perennials. There are a few new beautiful delphiniums and Michaelmas daisies and quite a number of single chrysanthemums.

Violets

After these have finished flowering the bed should have a good coating of manure, which may be dug well in between the plants. New beds may be formed by planting and subdividing the existing clumps.

Southern California

IF THE LAWN ever looked brown and ugly in former years it is far worse this year. It has been cold and dry so long that the sprinkling of Bermuda which gets into pretty much every lawn has lost every spear of green. A double handful of nitrate of soda thrown into the sprinkling can and dissolved in two or three gallons of water and sprinkled over the lawn will aid in giving it an earlier green than will be secured if left to itself. Still better and more permanent is the application of well rotted stable manure two or three times during the next week or two, then the surplus raked off and thrown onto the compost. Or, if preferred, a liberal dressing of complete fertilizer, or at least bone meal, is a wonderful help. Before the fertilizing a severe raking with a sharp garden rake will pull out many of the longer of the Bermuda runners, which may then be mowed off with the lawn mower, and this will give the blue grass an opportunity to get another start.

Gladiolus may be planted, or if the negligent gardener has allowed them to stay in the ground until this time since last season's growth they should be taken up at once and divided, and the little corms—if the variety is valuable—may be taken and put into seed bed. Some of our finest glads are easily multiplied if one is careful in saving these little corms.

Take up and divide cannas and calladiums! also plant most of the lilies, anemones and ranunculus, callas and dahlias.

If one has iris which should be divided at this season they should be handled at once, though it is really too late to get best results in dividing. But this plant is so extremely hardy that it will stand for almost any treatment. One may still sow California poppies though these should be almost ready to bloom. Practically all the annuals, such as poppies, corn flowers, calliopsis and asters and other annuals may be sown this month. It's a bit late but sweet peas may be planted during the next week or two.

It is a trifle early yet, but later in the month will be perhaps the best time to divide golden glow, Shasta daisies and chrysanthemums and other hardy perennials. But as to dividing chrysanthemums, we may say that it is usually claimed that better plants and more satisfactory flowers may be had by using the tender herbaceous tips and growing from these cuttings.

Use fertilizer everywhere, and in shady positions good results may be secured by careful application of nitrate of soda. This is recommended where the gardener usually claims better results from the use of blood or meat meal because in these shady conditions the soil remains cold longer and best results are not had from the organic forms of fertilizers so quickly as from the nitrate.

Leaves and dead weeds should be entirely cleaned out of the garden and made into compost heap. These with a little poultry manure, ashes or other house refuse make after a few months of composting one of the best potting soils. It is also excellent for use close to the young plants just set in the open.

LEGGY RUBBER PLANTS

Much complaint is heard from owners of rubber plants that they become long-stemmed or "leggy." But this is one of the easiest of all plant problems to solve. Simply cut it down to within a few inches of the pot; it will quickly sprout again. A much better disposition of the top is to propagate it and thereby gain one or more new plants. Make a slanting cut upward, about half through the stem and put in a piece of wood to keep the cut open. Pick a large handful of sphagnum moss to pieces until finely divided, drape it around to cover the cut portion, wind it about with string so it will stay firm and keep the moss moist, watering every day. When roots appear through the moss, cut through remainder of stem and pot the separated plant in as small a pot as you may without injuring the tender brittle roots.

The Butte County farm bureau has begun a campaign to secure 1000 members.

DISC PLOWS

The same accurate knowledge of Pacific Coast farming conditions, the same careful and simple designing, the same high quality of material and workmanship, the same high standards of strength and sturdy construction that have made the "Caterpillar" Tractor supreme in the farm-power field, have gone into the building of "Caterpillar" Disc Plows.

"Caterpillar" Plows are not a new product—we have been building them for years. They were produced primarily for use with the "Caterpillar" Tractor, so they had to BE good and MAKE good—we couldn't afford to endanger the enviable "Caterpillar" reputation by offering a plow that wouldn't prove equal to the severest tests of strength and service.

With any make of tractor, we know that they will help the farmer do a better job of plowing and enable him to get more out of his tractor by increasing the tractor's capacity for work and eliminating delays due to plow troubles.

Get the "Caterpillar" Disc Plow catalog and learn of the many exclusive features not found on any other plow!

Questions and Answers

ANSWERS BY EDITOR AND STAFF

Questions to be answered in this department should be received at the office one week before reply is expected. Write plainly on one side of the paper and sign full name and address. Unsigned communications receive no attention.

Pruned Walnuts Bleeding

The sap is running very freely from my recently pruned walnut trees. Will this injure them, and if so what is to be done? Should the pruning be continued?—Subscriber.

Cold nights and warm days makes the sap flow from recent cuts on walnut trees but does no harm, and in fact is sometimes an advantage if late frost should occur as it delays the opening of the leaves and may prevent frost damage. Sap is likely to flow from fresh cuts on walnut trees at any time during the dormant period and until new leaves are formed. This excessive flow of sap is often very troublesome when top grafting of walnut trees is undertaken as the scions will not grow unless all cuts are kept covered with wax and are airtight which cannot be done when there is a strong flow of sap uncontrolled.

The flow of sap from the stubs in which the scions are placed can be controlled by boring small holes in the trunk of the tree near the ground. By using a brace with a one-quarter inch bit and making one or more holes two or three inches deep the worst cases can be controlled.

The method we have followed is to bore one hole and wait a few minutes to see the result. If this is not enough bore another hole and continue, with a few minutes wait between borings until the flow over the top stops, but do not make holes after the flow stops as it is necessary that some sap reach the scions. Then clean off the cuts, wipe dry and wax thoroughly. It sometimes happens that the holes stop and the overflow begins again. In this case clean out the holes with the bit and rewax the scions.

Walnut pruning can be continued all through the month of February and into March until the buds open, and in fact might be done after the new leaves form if it was not for the difficulty of removing the prunings without breaking off the fruit buds.—J.B.N.

Three Year Old Leghorns Profitable

We have S. C. White Leghorn hens that will be two years old in May. Is it advisable to keep them another year?—Subscriber, Porterville.

Many White Leghorn hens are profitable for three years. Some are not. You can judge something of the class to which yours belong by their record the past year. If they laid so well that they would still be profitable with the record reduced ten per cent, keep them at least till fall. The chances are that a hen will lay fewer eggs in her second year than in her first, and fewer in her third than in her second. They will probably lay well this spring. As production begins to decline with the coming of summer you can cull out the hens that are not laying and get rid of them. You may find in the fall that some have done so well they are worth keeping through another winter as breeders. The early molters and those that do not pass the color test in October and November, if you have kept them that long, can be culled out. We thought some years ago that a hen was hardly worth keeping after her first year. Now we find it costs so much to raise a pullet that old hens are just as profitable if they lay fairly well and breeders are working for the hen that will lay profitably for five years.—J. A. K.

Hoeing About Old Trees

What advantage is there in hoeing old trees?—Subscriber, Winters.

It is impossible to give specific answer to such a general question. Whether our subscriber is referring to live oak, lemon or other varieties of trees is impossible to imagine. If lemons or oranges are referred to, or any other variety of tree which is of low growing, spreading habit to the extent that it is impossible to get next to trees with cultivator or weed cutter, then it is perhaps necessary to cut out the big weeds and to loosen the soil underneath these trees so that the air may enter and keep the soil sweet and pure. In case of trees like pears, walnuts or others where it is possible to work with plow or cultivator clear up to the trunk such method of handling is much cheaper.

Branches Growing Downward

What makes limbs of the fruit trees grow downward?—Subscriber, Trowbridge.

Because it is the habit of some trees to do so. On the other hand it is the habit of other trees to send the branches upright until the weight of fruit carries them over and downward until young buds come out on the top and again start upward. We have seen prune branches upright and with almost every branch pointing to the sky, carried over so some of the longer branches literally lay on the ground with the weight of the fruit.

Citron

How is citron grown and what process is used to prepare it for market?—Subscriber, Trowbridge.

The citron is grown as is the lemon or grapefruit or others of similar citrus fruits. It is usually very large with thick skin which is the only part of the fruit used. The small amount of pulp in the center is waste. The tree will not endure the frost which the orange will and scarcely even as much as the lemon. We know of only one orchard in California and that is near Riverside. The main reason why

UNIVERSAL BRAND

ORCHARD SPRAY

For dormant season spraying you want a good, general clean-up spray; a spray that will serve not alone as an insecticide—but will tone up and stimulate your fruit trees. For instance—

Crude Oil Emulsion

You can depend on this to control the scale insects. It penetrates the cracks in the bark and *kills the eggs*. So—what chance is there for Red Spiders, Aphids and their creepy brothers to do much damage?

Order your Universal Spray now—don't take any chances.

Among the other sprays we manufacture or distribute are:

Dormant Soluble Oil
Bordeaux Mixture
"Triumph" for Citrus Trees
Lime Sulphur Solution
Arsenate of Lead
Miscible Oil No. 1 for Olives
Miscible Oil No. 2 for Thrips

Whenever you have any questions to ask—write our Service Department, in charge of Paul R. Jones, Entomologist. This expert advice costs you nothing.

A SPRAY *for* Every Purpose

citron has not been produced in California is the labor question. Most of the supply for this country is shipped from Italy, pickled in a brine and the curing is done here. When the fruit ripens, pick, cut in the middle and soak in a brine. Later it is boiled, the salt water removed and candied.

Skunk Farms

Will you please furnish me with the address of one of the most reliable skunk farms in my section? — Subscriber, Kingsburg.

Do any of our readers know of successful skunk farms in California?

Spray to Kill Stumps

Is it practicable to kill willow sprouts and alder stumps along irrigation ditch where it is not possible to blast or pasture goats? Is there a spray which, if applied to the tender shoots, will ultimately kill out the stumps and roots?—Subscriber, Grass Valley.

We question whether such a spray could be used which would be very economical. A method of controlling weed pests has been explained by Prof. G. P. Gray, chemist in insecticide laboratory of the University of California, who can give more complete information.

Sprouted Barley

I note in last week's issue, answering a subscriber from San Diego in regard to a grain ration for poultry, you advised barley for one cereal and stated that part should be sprouted. I would like to know what proportion should be sprouted and what the object is. I am feeding corn in the morning, barley in the evening, keep a dry mash before them and feed greens twice a day, mostly cauliflower and cabbage leaves and would like to know if you consider these good greens.—Subscriber, Rivera.

The object of sprouting barley is to make it more digestible and more palatable. When I said part of the barley ration should be sprouted I was thinking of the various forms in which barley may be fed. Seed barley, I believe, should be all sprouted when possible, but sometimes rolled barley is used, and sometimes hulled or scoured barley, in which case sprouting is impossible. I should have said, perhaps, that part of the barley ration should consist of seed barley sprouted from three to five days. Cauliflower and cabbage are good greens, but it is said that when used to the exclusion of other greens they are apt to flavor the eggs. Barley run through a cutter after it is a few inches high is one of the most easily raised and satisfactory greens.—J.A.K.

Ducks Not Good Mothers

My Indian Runners did not care for their ducklings, never hovered them, just let the little ones freeze. Is that the usual way with Indian Runners? Out of 40 or 50 hatched out I did not raise one. These ducks are not very extra layers. It is now almost February and they are not laying. I am a greenhorn with ducks. Should I have taken the little ones away and raised them by hand? — Subscriber, Dos Palos.

You are not the first person that has been disappointed in Runner ducks. Some of them may be good mothers—I do not know—but the average duck, except the Muscovy, cannot be depended on to hover her babies. They are usually raised in brooders, fireless or with some heat. As soon as you saw your ducks did not hover the ducklings you should have put them in a box with a hot water bag or bottle and raised them by hand. Ducklings do not require a great deal of heat and are raised successfully in the coldest weather we have in fireless brooders when a sufficient number are together. Perhaps one reason why your old ducks are not laying is that they have not sufficient animal food. They should have a moist mash of corn meal and bran with about ten per cent beef scrap added twice a day and cracked corn or other grain for the noon meal.—J. A. K.

Marmalade Factories

Will you kindly tell me how many factories there are in Southern California that make marmalade from citrus fruits?—Subscriber, Porterville.

We believe there are only two factories that make an exclusive business of making marmalade from citrus fruits. These are at San Dimas and at Anaheim. There are others of course handling waste products of citrus fruits. Of these are the W. H. Bush Company, National City; Kingsbury plant at Redlands, large exchange plant at Corona.

Alkali Land

I have a piece of alkali land about three acres, and would like to know how to get rid of the alkali. It is only about two inches thick. Below the alkali it is sandy. What crop would be best to raise, trees or vines? — Subscriber, Hanford.

If your subsoil is sandy to a depth of several feet and the drainage is good, flooding will leach out most of the alkali with a few irrigations and in time will take it all out. If the drainage is not good, you cannot wash the alkali out unless you tile it. The tile should be at least three and one-half or four feet below the surface. I would plant grapes in preference to peach trees. Alkali land is usually very rich in plant food and if the alkali is properly removed the soil is as good as any, provided too much common salt is not present. A large percentage of common salt leaves a bad effect on soil long after it has been removed.—J. W. M.

Almonds not Bearing

We have several almond trees that do not bear hardly at all. They have plenty of water, cultivation, pruning, etc. Neighbors have advised us that the linnets and sparrows have a great liking for the buds, and probably strip them. In that case what would you advise to do? We have tried poisoning with fruit, poisoned wheat, etc., but don't seem to get many of them.—Subscriber, Delano.

This may be because of the birds, but perhaps it is because you have planted a variety not suited to the section or because of lack of pollenization. If almonds generally bear well in your section, then this variety may be one that blossoms early and is caught by late spring frosts. Investigation in other orchards of the same variety may help to solve the question.

Overbearing of Apple Tree

I have an apple tree in my door yard which has very long branches and is so loaded every year the limbs have to be propped. An early summer variety ripening in July. Last year the apples were of a very inferior quality, worm eaten and shriveled. What should be done to it? Should the long limbs be cut back? How many main branches should there be? I suppose it should be sprayed; when?

Break that habit

In the early days—before our time—when grain was shipped in olden sailing vessels, it was *sacked* to help in overcoming the listing of the ships on their then long and dangerous voyages around the Horn.

That was in the old days of '49. But it started a costly habit. Using sacks to ship grain has stayed in California—though the rest of the grain-growing world discarded the habit long ago. Stayed, in spite of the fact that California mills and railroads are fully equipped to handle grain in bulk.

How do farmers in other grain districts handle grain in bulk? They install metal grain bins on their farms. They thresh directly into dump wagons and haul to their own storage bins. They cheat the rats, the rain and the thieves. They eliminate the entire cost of sacks, twine and needless labor.

Use metal grain bins

CALCO Metal Grain Bins are made for the California grain grower—to save grain and the cost of marketing grain. Two men with hammers and monkey wrenches can erect a Calco Bin very quickly with the punched and shaped-to-fit galvanized sheets that come. Strong bolts hold the rust-resisting sheets together securely.

A Calco Metal Grain Bin will last a great many years. It will pay for itself quickly—and then costs nothing. It fits the economical bulk handling facilities of mills and railroads. The Calco Bin breaks the old, costly, disadvantageous, rat-feeding, grain-losing sack habit.

Get this booklet—free

Write for the booklet, "Calco Grain Bins." It compares costs in a simple, direct way. It tells of actual installations of Calco Bins. You should have it. It's entirely free if you write for it at once.

CALCO Metal Grain Bin

Chinese Production of Beans

IT IS only within the past ten years that the outside world has become acquainted with the soya bean of China. It is probably safe to say that the sudden rise of the soya bean from a position of comparative obscurity to a position of prominence in the world of trade, during a period of little more than a decade, constitutes one of the commercial wonders of the world. In the Far East soya beans are used for the following purposes: (1) For bean sauce or soy ("soya" is a corruption of the Japanese "shoyu"), known to the Chinese as "chiang-yu" and made "by boiling the beans, adding an equal quantity of wheat or barley and leaving the mass to ferment; a layer of salt and three times as much water as beans are afterwards put in when the liquid is pressed and strained." The sauce is clear, resembles Worcestershire sauce, and is used in a somewhat similar way. (2) For "chiang" or bean paste, eaten with fish, meat, and vegetables, and made by boiling together one part yellow beans and two parts water, grinding the mass into the shape of a pancake, and laying it in a cool place for fermentation; completed after two months, after which salt is added from time to time as the water evaporates, making the mixture ready in two weeks for consumption. (3) For "toufu" or bean curd, made from green or yellow beans by steeping the beans in water, grinding in a stone mill, passing through a strainer (which retains the epidermis of the beans), then boiling in a pot, after which the preparation is poured off into a jar and a well-diluted brine added, which, being stirred in, causes coagulation of the proteid compound legumin or vegetable casein; the mixture is then ready to be drained off and cut into blocks for sale. (4) For a form of flour, extensively used for bean vermicelli, which is tasty and nutritious. (5) As a table vegetable. (6) For soups. (7) For making confectionery (in Japan). (8) For oil, as a substitute for lard, as a lubricant, as an illuminant, and to make waterproof cloth, paper unbrellas and lanterns.

Bean Products—Exports

Bean cake is the residue after the oil has been extracted and is extensively used throughout the Far East as a fertilizer and to some extent as cattle feed. Consul Johnson describes the manufacture of bean milk at Changsha from the small yellow soya bean. The product looks like unskimmed cow's milk, has a slight odor of beans, a fat content of 3.1, is not unpleasant to the taste, and can be delivered to customers at Changsha at 50 cents gold per month for one pint a day. In the western world the soya bean is used but little as a foodstuff. Its principal use is for oil; a refined variety mixed with other oils serves as a salad oil or in margarine. One of the principal uses to which bean oil is put in western countries is in soap manufacture, though it is not as good in quality for this purpose as cottonseed oil. It is also used in the manufacture of various edible goods, toilet powders, paint oils, lubrication and lighting oils. The soya bean contains about 18 per cent oil. There are three main classes of soya beans—the yellow, the green, and the black, each with several subvarieties. Manchuria is the center of the soya bean and the bean oil industry, with Dairen as the chief port of export. Dairen exported, during 1917, 110,000 tons of bean oil, valued at 16,000,000 taels or United States dollars, the bulk of which went to America, mostly via direct route to Seattle. This is a surprising record and one that in view of such present factors as high war freights and unfavorable silver will probably be maintained after the war. The vast bulk of the bean cake goes to Japan. Consul Williamson, of Dairen, estimates the Manchurian bean crop at 1,500,000 to 2,000,000 short tons. Consul Moser estimates the soya bean crop of northern Manchuria at more than 1,000,000 tons a year, 50 per cent of which goes to Japan.

The exports of beans and bean products from China during 1917 were as follows: Black beans, about 4,000 tons; green beans, about 15,000 tons; white beans, about 10,000 tons; yellow beans, about 530,000 tons; other beans, about 120,000 tons; total, about 679,000 tons, valued at 20,000,000 taels (one tael in 1917 equivalent to $1.02 United States Currency.) Bean cake, about 1,030,000 tons, valued at 24,000,000 taels; bean curd, about 2200 tons, valued at 270,000 taels; bean oil, about 130,000 tons, valued at 19,000,000 taels. Total, beans and bean products, 1,841,200 tons, valued at 63,270,000 taels.

In the above total of beans exported are included Hankow broad or horse beans, which are different from soya beans, but which amounted in value to less tnan 1,000,000 taels. They are shipped abroad as cattle feed.—The Bean Bag.

All Southern California was visited by a soaking rain last week.

Put Your Farm on a Goodrich Basis

TAKE up your farm account book, and run your pencil down to the item, *tires*. Write Goodrich before the item, and cut its figures for 1919.

For the long lasting life of Goodrich Black Safety Tread Tires attack tire costs fore and aft.

Make Goodrich tire costs your standard. If you pay more, the tire takes it out of your pocket; if you pay less it takes it out of you and your automobile.

Have a close face to face look at the burly, broad-shouldered Goodrich Tires.

Notice how their extra wide SAFETY TREAD, with anti-skid bars set well up the side of the tire, fortifies the sidewall against the grinding of road ruts.

All through and all around, Goodrich Tires are built to render service value up to the last cent of their cost.

Goodrich Truck Tires give the same low operating cost in your heavy hauling.

A farm on a Goodrich basis is saving money in its tires, pneumatic or truck.

Buy Goodrich Tires from a Dealer.

"BEST IN THE LONG RUN"

COTTON AT PORTERVILLE

By Martha L. Baker

That Egyptian long staple cotton can be successfully grown in this part of the San Joaquin Valley has been demonstrated by S. H. Stevenson, who has just completed harvesting a crop of two and a half acres grown on the A. M. Sanborn ranch about three miles southwest of Porterville, Tulare County.

The cotton, amounting to about 1000 pounds, was sent to Fresno to be ginned. Mr. Stevenson estimates the crop will yield him returns of about $400 to the acre.

The cotton, which was grown on soil of a sandy nature, was planted May 20. An earlier planting on April 20 was destroyed by bugs, necessitating replanting which made the crop several weeks late. Part of the cotton was grown between rows of olive trees as the Sanborn ranch is developed largely to olives.

The crop was given three cultivations and five irrigations. As high as 250 boles were found on one plant. The cotton was planted by means of a wheat drill, about six pounds of seed to the acre being planted. It came up so thick about two-thirds of the plants had to be thinned out.

Sixteen acres of kaffir grown on the Sanborn ranch yielded only about $750. The two and a half acres of cotton will yield fully $800. The cost of production of both crops was about the same.

The success of this, the initial experiment of commercially grown cotton in this district, is expected to lead to quite an extensive cultivation of this cotton in this district this coming season. Mr. Sanborn, recently discharged from army service, expects to put out ten acres of cotton this spring. Another progressive rancher contemplates planting 40 acres.

DEPARTMENT OF AGRICULTURE

Some of the leading farmers of Nebraska recently met with their new governor, McKelvie, and discussed putting the general direction of the agricultural activities of the state under one head. Then too there has been a board of managers which has handled the annual state fair, made certain reports as to agricultural activities, but done little in the matter of general direction of agricultural activities. The general recommendations resulting from the conference are extended. In the main they are:

"The first and most important thing to be accomplished is to remove from party politics the different state boards which have to do with the control of all activities pertaining to both commerce and agriculture. Any plan that fails to recognize this important thing is doomed to failure and will not be approved by the people in the final verdict."

"The different activities should be grouped under two general heads. With our present constitution the governor would have to be the head of each department. We recommend that the head of one department should be known as the commissioner of commerce and welfare, and that the other one should be known as the commissioner of agriculture."

"Under the commissioner of agriculture we would place the state board of agriculture, live stock sanitary board, and veterinary department. Stallion registration, inspection of foods, feeds, oils, seeds, dairy and similar activities, with power to enforce all laws pertaining to the same. Of the department of agriculture we wish to make more definite recommendations at the present time, which can be worked out still more in detail later."

"17-YEAR LOCUST" DUE THIS YEAR

The year 1919 is likely to be one of the worst "locust years" on record. But entomologists of the United States department of agriculture see nothing alarming in the prospect.

The periodical cicada, the real name of the insect commonly called "locust," will appear this year in the following states: Alabama, District of Columbia, Delaware, Georgia, Illinois, Indiana, Iowa, Kentucky, Maryland, Massachusetts, Michigan, New Jersey, New York, North Carolina, Ohio, Pennsylvania, South Carolina, Tennessee, Vermont, Virginia, West Virginia, and Wisconsin.

The injury done by the periodical cicada consists almost wholly in chiseling grooves in the branches of trees

for depositing eggs. This injury always appears to be greater than it actually is. Popular alarm is usually out of proportion to general damage.

When the insects begin coming out, hand pick them from young fruit trees or spray them with pyrethrum powder, kerosene emulsions or a solution of carbolic acid or acetic acid.

Later, when the insects are ready to begin laying, spray young fruit trees with whitewash.

HOW TO WIN THE REST OF THE WAR

By Herbert Quick

We think we have won a great victory over Germany — and we have. Germany is so weak that an army of 30,000 Poles, as I wrote, are threatening Berlin. It looks now as if anyone might kick Germany around—the once all-powerful Germany!

Why is Germany weak?

Because the Germans have lost control of themselves.

Unless we retain control of ourselves — of our own souls — we have have not won a complete victory over Germany. If we retain or acquire complete control over ourselves we can win the rest of the war. Unless we do win the rest of the war we have not only defeated Germany, but we have defeated and disgraced ourselves!

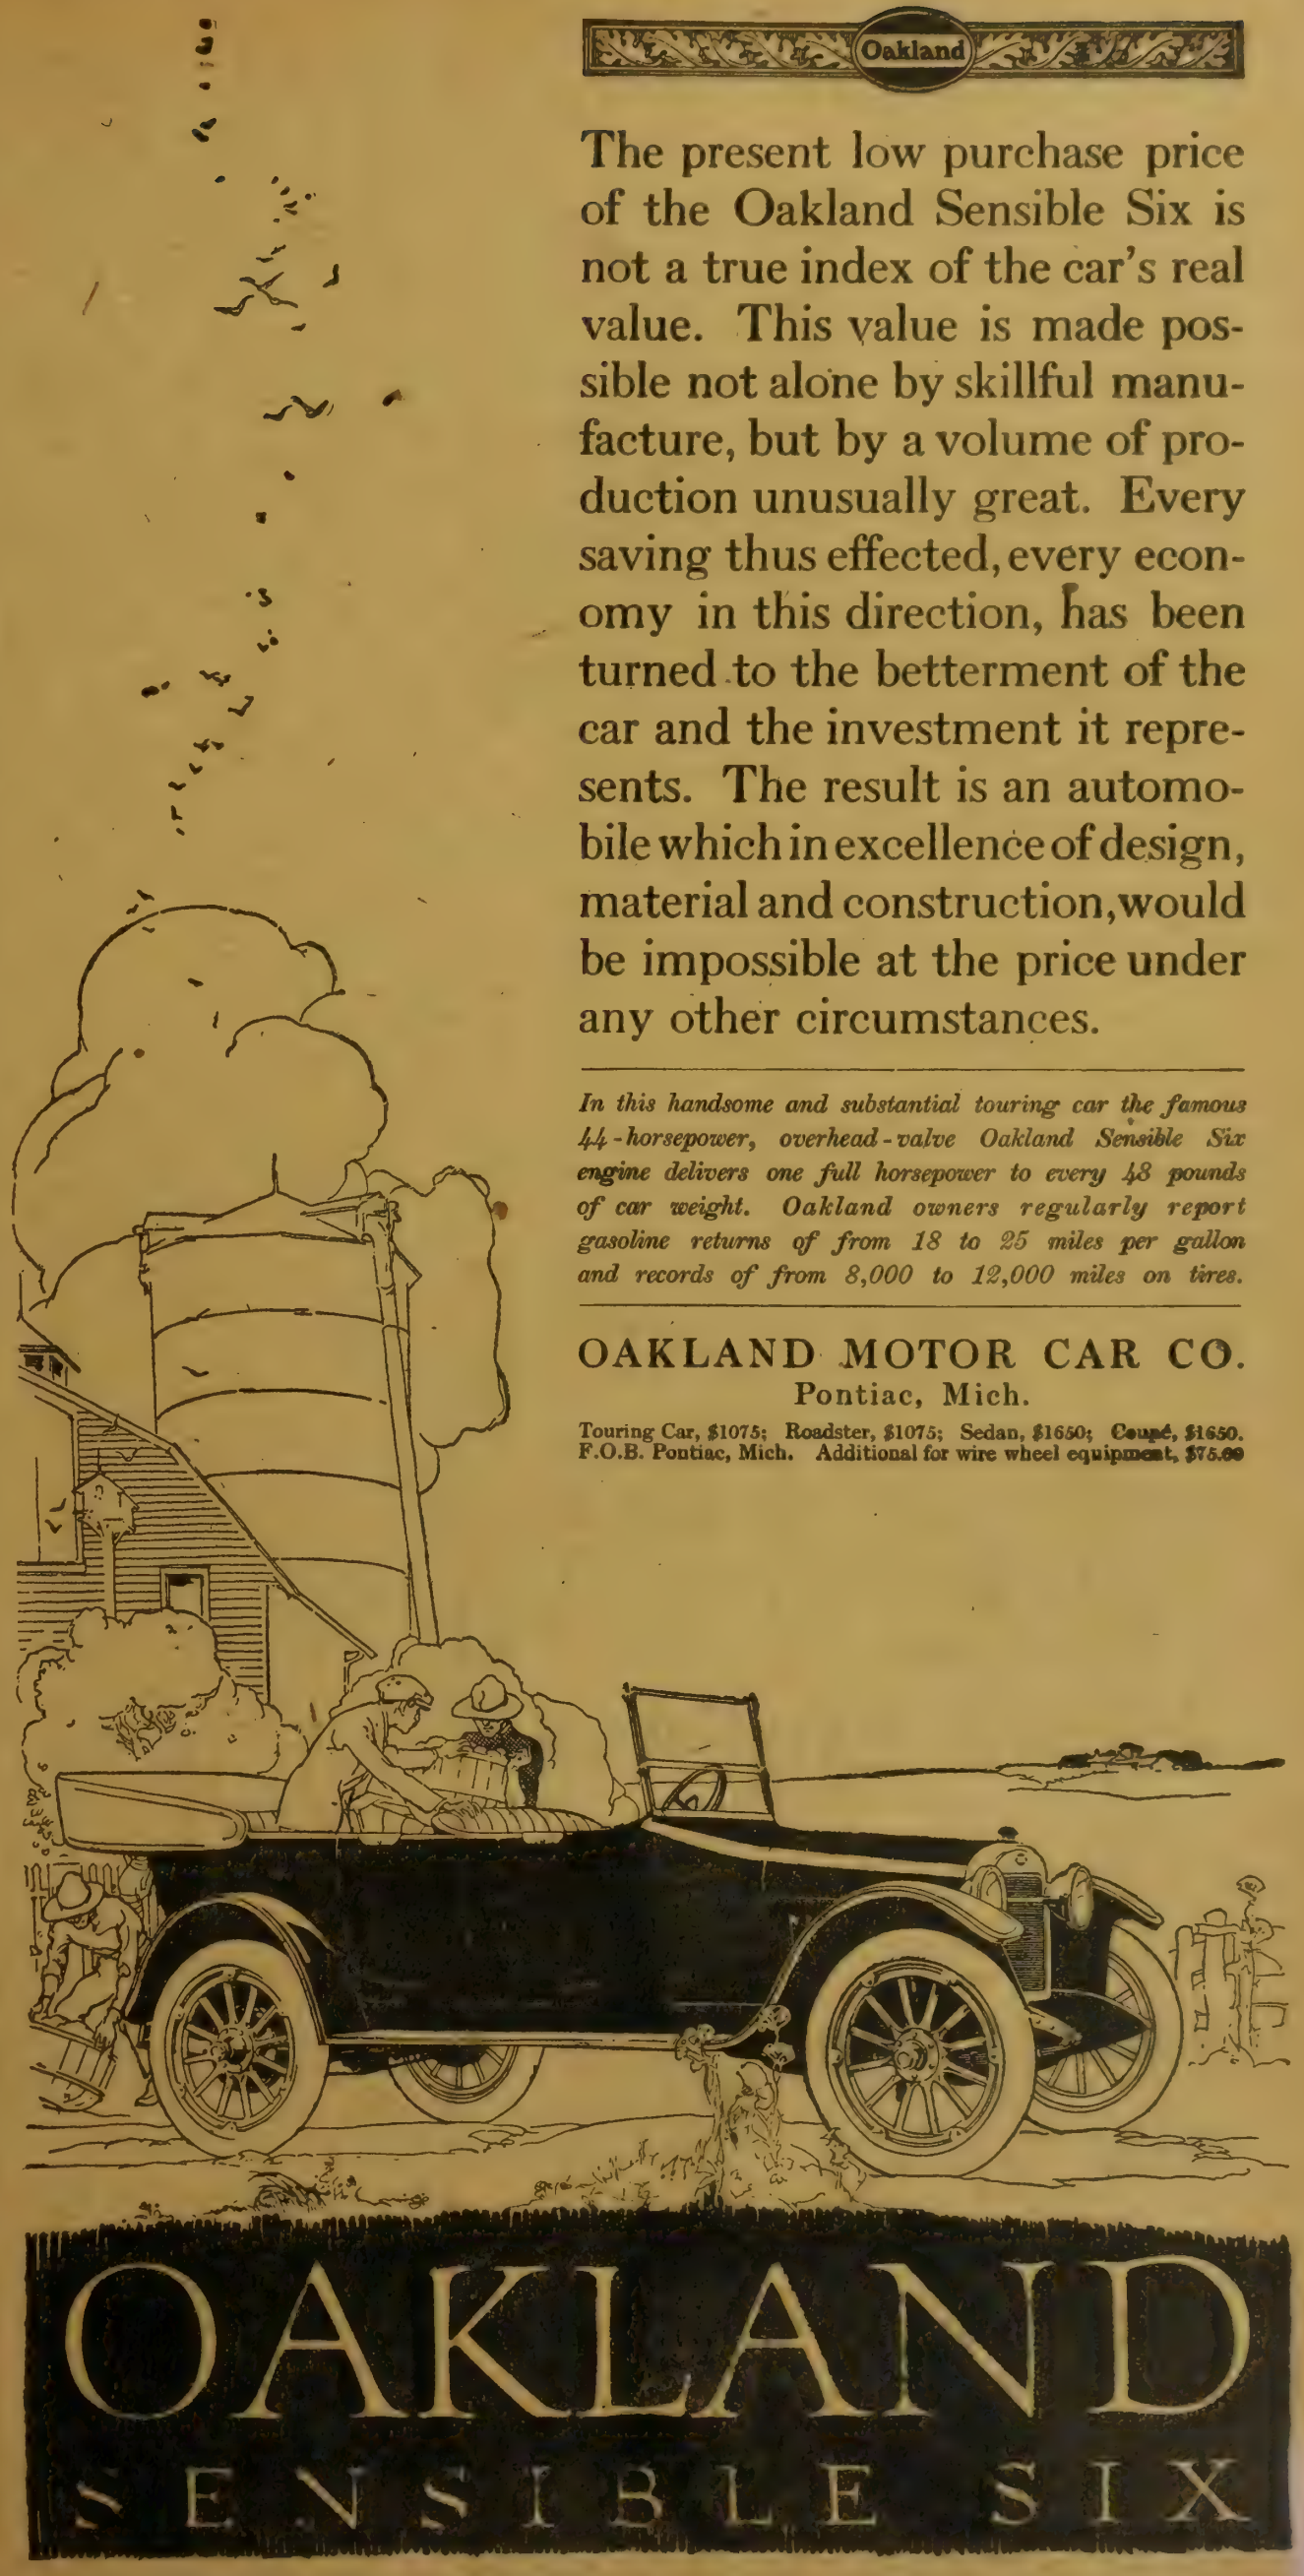
The saddest nation, the nation most completely crushed is the nation defeated by itself; and the deepest disgrace is that which is self-inflicted. Germany can emerge from her defeat and humiliation and disgrace, after a while, by getting a new grip on her own soul. The only hope for victory for her is the hope of victory over herself.

What do I mean by suggesting that we must win "the rest of the war?"

I mean that the heaviest, if not the bloodiest, part of the task is still before us. We have that great army of which we are so proud—it seems to us the bravest, finest, most splendid army the world ever saw—still under arms and encamped on the soil of Europe. They said in Germany that we could never get that army across the ocean, but we did. They are across the ocean now, our soldiers, 2,000,000 of them. They must be supported, clothed, fed and made as comfortable and happy as boys so far from home can be made, until they can be brought back.

And they must be brought back.

When they are through with their wonderful, their epic task, they must be brought back.



And it will cost as much to bring them back as it did to take them over. It will be in some ways a harder task; for all the world on our side wanted them to go over and was willing to help while nobody but the little old United States is especially interested in getting them back.

INSTALL A FARM REPAIR SHOP

A small farm shop, equipped to handle the simpler repairs, will soon pay for itself. It saves money, returning its original cost rapidly. F. A. Meckel of the University of Missouri college of agriculture says the shop need not be equipped with expensive tools; that some of the handiest shops have been installed at very reasonable prices.

The greater part of many winter days can be spent in putting the farming implements into good condition. It doesn't require much shop equipment to make welds and bend rods. A forge, anvil, tongs, and hammer will do it. With these tools as a start, others can be made. Old machinery ready for the junk heap can be rescued and handy tools made from its steel. Chisels of all shapes and sizes, S-wrenches and the like can be shaped from old steel and tempered to suit the use to which they are to be put. Tongs of any size and shape may be made from the wrought iron parts. Old files can be made into useful tools.

Add to the equipment a press drill, and many visits to the village blacksmith will be forestalled. The best thing about having a shop is that the more it is used, the more proficient the operator will become. Results at first may be disappointing, but the new smithy can soon develop a proficiency in handling the common repairs. And there is always the opportunity open at the university to learn shop practice.

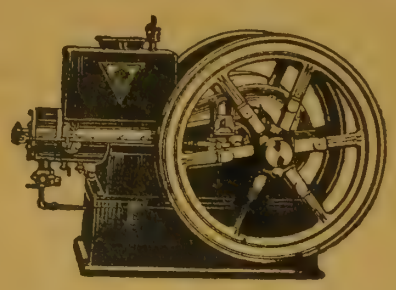
Can you drill *Arcadian* Sulphate of Ammonia? Why, Certainly.

ARCADIAN SULPHATE OF AMMONIA



ARCADIAN Sulphate of Ammonia has been kiln-dried and ground so that it will spread easily in a drill or distributor at the rate of 100 pounds per acre or less if desired.

Each particle of fertilizer falls on its alloted inch of ground and each plant gets an equal share. This results in an even start, uniform growth and proper ripening of the whole crop at one time. It is the modern machine against hand labor again, and the machine wins every time. Try it and see.

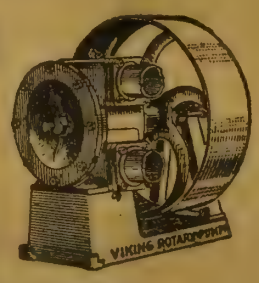
Pumping Equipment

Alpha Engines



1¾ to 18 H. P.

Have the quality and stamina to develop full power economically, season after season without that rapid deterioration common to engines of lighter construction or less efficient design. Buy it—the Alpha is the easiest starting, most perfectly balanced engine made.

Viking Pumps

20 to 1100 gallons per minute

The ideal pump for irrigation. Excels in efficiency due to low speed and positive discharge. Will pump against any head up to 150 feet. High efficiency reduces power costs—no churning of water or wasted power with the Viking.

Legal Queries

Louis B. Stanton, attorney, 243 Wilcox Building, Los Angeles, will answer legal queries in this department.

Immediate mail replies cannot be given except where fee to Mr. Stanton is paid. When replies are wished in Cultivator address query to 115½ N. Broadway, Los Angeles.

Road Right

Several years ago I sold a right of way for road along the lower part of my orchard to my neighbor. Now, during my absence, he has dug a deep ditch along my side of the road which has the effect of excluding from me the use thereof and also diverts storm and irrigation water from its natural course away from my land and settles it in this ditch. What are my rights?—Subscriber, Lindsay.

Your rights are of course dependent upon the length of time this condition has been allowed to exist by you. If for five years or over you could probably do but little. If the ditch is of recent character or if it is sought to deepen it you could undoubtedly prevent the condition through injunction proceedings, providing that your grant of the right of way does not provide for such a condition. It is a matter so dependent upon the exact and detailed facts that you should take it up with your local attorney.

Division of Property

Wife has helped to accumulate a few thousand dollars and now desires a division of the property as she has nothing to say about business matters. What steps should she take?—Subscriber, Lindsay.

Apparently there is an erroneous idea in the mind of the above subscriber. Marriage is in the nature of a life contract of partnership. The law provides that upon the dissolution of the partnership by death the wife shall have one-half of the community accumulation; in case of dissolution by divorce the division is frequently made by the court according to the facts of the case. During the marriage the husband is given the management and control of the community property; this is essential as he is the business man of the firm and the general business of the community could not well be otherwise conducted. It may work hardship in some instances, but it is for the general good.

To Perfect Title

In 1912 I bought land for which the vendor sent me a deed signed but not acknowledged. I returned it for acknowledgement, but the letter was returned undelivered. I have been unable to locate him since. How can I proceed to perfect my title?—Subscriber, Los Angeles.

There are several methods which could be employed. You might bring action to establish adverse possession under the written claim of title providing the land has been usually cultivated or improved, or substantially inclosed, or used for fuel supply, fencing timber, pasturage, or the ordinary use of the occupant and payment of all taxes for the period since 1912. Or, under section 1203 of the Civil Code, you may institute an action against the proper parties for proving the instrument to be entitled to record, in which case you could doubtless serve by publication of summons. Or you could take the usual action to quiet title with publication of summons. And there are other ways.

Contract by Minor

Kindly let me know whether or not a contract signed by a minor is valid.—Subscriber, Solvang.

A minor cannot appoint an agent nor, under the age of 18, make a contract relating to real property or any interest therein or relating to personal property not in his immediate possession or control. He may make any other contract subject to his power of disaffirmance. He cannot disaffirm a contract made for the reasonable value of the things necessary for the support of himself or family entered into when not under the care of a parent or guardian able to provide, nor a contract made under express authority of statute; in all other cases he can disaffirm if made whilst he is under the age of 18 either before majority or within a reasonable time thereafter; if such contracts are made whilst he is over the age of 18 it may be disaffirmed in like manner upon restoring the consideration to the party from whom it was received, or paying its equivalent.

Defective Tractor

I bought a tractor from a responsible concern which represented it to be all right, for which I took their word and paid $500 down and gave note for the balance, with no written contract. The tractor continually broke down and although the concern continually fixed it it is clearly a defective piece of machinery. I have demanded back my money but they claim it is my fault. What should I do?—Subscriber.

It is purely a question of fact whether or no the breakdowns are by reason of your handling of the tractor or by reason of defective machinery; if the former is the case the seller is, of course, not liable; if it is defects in the tractor you are entitled to resist payment of the note and probably recover monies paid. The rule has been declared by our courts that any affirmation made at the time of sale as to the character or condition of the thing sold will be treated as a warranty, if so intended, and if the other party acquired the property upon the faith of the affirmation. The only difficulty you would experience would be in proving the representation; if proven, your measure of damages would be in excess, if any, of the value which the property would have had over its actual value with, possibly, fair compensation for the loss incurred by an effort in good faith to use the tractor.

QUESTIONS AND ANSWERS

Continued from Page 173

When the leaves dropped in fall we found there was much of the fruit had not dropped and are yet hanging in the tree dried and shriveled. — Subscriber.

If this tree has been bearing crops it is too late to begin shaping it. This should have been done the first three years of its growth. If it has long branches they may be topped, cross limbs removed, and it might possibly be advisable to thin so as to let light and air into the interior of the tree. Then when the fruit is just setting at the close of blossoming, spray with arsenate of lead, three pounds to 50 gallons. This may be repeated every two or four weeks, using a nozzle which permits a fine fog to be delivered so as to leave some of the poison in the blossom end of the fruit. This spray is for the codling moth or worms of the apple. There may be scale or other insects infesting the tree which call for other sprays. Again, it is possible that the fruit shrivelled because of lack of moisture, for it must borne in mind that last year's supply of moisture was very limited.

Sow Bugs

I notice a great many round blue bugs, called by some "sow bugs". Will you kindly instruct me what damage they do and the best method of eradicating them. My soil is a heavy dark loam, almost an adobe and holds moisture a long time and I notice these bugs collect thickest under boards or heavy strawberry plants or in piles of rubbish where there is continuous moisture.—Subscriber, San Jose.

Sow bugs are as a rule feeders on decaying vegetable matter and unless starved to it will not attack living tissue excepting such food plants as mushrooms, and sometimes strawberries. They infest damp places and are attracted by rich soil with plenty of humus. A good poison bait is made by slicing potato, rolling in Paris green and placing under the fruits or leaves where they gather.

Dates

Can the date palm be successfully grown in the San Joaquin Valley either for home use or as a paying industry for market? What kind of soil do they require? Is the date palm dioecious or a hermaphroditic? How long before they come into bearing? How old must they be before transplanting from the nursery? Does it take much water to make them grow?—Subscriber, Reedley.

The date palm has not yet been commercially grown in the San Joaquin Valley, but there are individual trees, and an experimetnal planting has been made by W. R. Nutting near Fresno. We believe this planting has not yet fruited. Date palms are not partial as to soil but have been known to do well in very heavy soil even with a large percentage of alkali. They do require a sufficiency of water. "Their feet in the water; their heads in the burning suns of the desert" is one of the slogans of the North Africa date growers. Grown from suckers and from the right varieties they will bear in two or three years from planting. A year in nursery is sufficient, when they may be transplanted. They are dioecious so that in planting seedlings there is practically a 50 per cent loss from the male trees. One male, or pollen bearing tree, is sufficient to pollinate a great number of bearing trees.

Chlorosis or Mottle Leaf

I would like to get a little information about yellow leaves on orange trees. I have them on two different kinds of soil; about four acres is light sandy loam and two, heavy granite mixed with a little alkali. In sandy loam they are all right, green and thrifty; but in the heavy soil they are looking yellow. — Subscriber, Anaheim.

Your heavy soil needs lightening with abundance of vegetable matter such as coarse strawy manure, leaves or anything which will lighten it up, warm it and allow air to enter. Besides it is very probable those particular trees are getting too much moisture. Citrus trees require air at the roots, which means that they are easily drowned out. However, the nature and control of chlorosis or yellowing of leaves is a long problem and there may be many answers to the question as to what is the cause of the yellowing of leaves on this particular tree, but the application of lime and a great abundance of vegetable matter spaded into the soil, with raking away of the hard soil from immediately around the trunk and filling in with sand may prove beneficial.

Katydid and Its Method of Depositing Eggs

Katydid Eggs

I am sending in separate package a small peach twig with some kind of insect eggs on it. What are they? Please tell me what to do for them if they are harmful.—Subscriber, Winton.

These are katydid eggs, and unless present in great quantities are no menace whatever.

There are so many who are concerned over the appearance of the "mammoth scale" that we have made reproduction of an engraving in "Manual for the Study of Insects" by Comstock. As will be noted these are eggs and not a scale insect, but eggs which when hatched produce the comparatively harmless Katydid. Though there have been times when they have been somewhat of a pest, this is so seldom that unless present in immense numbers they may be ignored.

Casey: "Now, phwat wu'u'd ye do in a case loike thot?"

Clancy: "Loike phwat?"

Casey: "Th' walkin' diligate tills me to stroike, an' me ould woman orders me to ke-ape on workin'."—Western Christian Advocate.

WALLIS

America's Foremost Tractor

WHETHER plowing, threshing or doing other farm work, the Wallis Tractor gives true economy.

Wallis first combined light weight, great power and durability in a tractor; built a tractor weighing 1000 to 5000 pounds less than others of equal power.

This was accomplished by replacing heavy cast and malleable iron with strong, light steel; by designing light-weight, sturdy drive wheels; by introducing the simplified "U" frame—the lightest, yet strongest construction known to mechanics.

Wallis first enclosed all gears, including the final drive—thus saving power and protecting vital parts. The Wallis motor and transmission are as perfectly finished as an automobile motor.

The result is a tractor that burns one-third to one-half less fuel per acre plowed; that cuts the cost-per-acre of plowing to the lowest figure ever known. It made the Wallis America's Foremost Tractor.

The latest Wallis catalog tells all about this tractor. Write for a copy and for name of nearby Wallis dealer.

$3,000 in Cow Testing Prizes

A. E. GREENE, chairman of the committee in charge of the contest being conducted by Sacramento-Yolo Cow Testing Association, states that $3000 worth of prizes will be distributed among the winners. The contest is similar to the one conducted by the University of California.

The contest has been arranged for the purpose of encouraging better methods of management among the rank and file of dairymen and for that reason most of the classes are for grade herds. The association defines a grade herd as one consisting of 50 per cent grade cows. Herd prizes will be based on the average number of cows tested during 1919.

The complete classification follows:

Class A—Grade herds of one to 20 cows.

Class B—Grade herds of 21 to 50 cows.

Class C—Grade herds of more than 50 cows.

Class D—Grade herds in Classes A, B and C that are headed by grade bulls.

Class E—Highest yearly record by cow, grade or pure bred, under five years.

Class F—Highest yearly record by cow grade or pure bred, over five years.

Class G—Highest monthly group of five grade cows in one herd. Winning cows barred each succeeding month.

Class H—Highest yearly average made by a grade Jersey herd.

Class I—Free for all. Herd showing greatest improvement during the last six months of 1919 over the last six months of 1918.

Class J—Champion herd, grade or pure bred.

The following individuals and firms have contributed cups, merchandise and registered dairy bulls for prizes:

The California Cultivator; Sacramento Clearing House Association; The Sacramento Bee; Patterson Dairy Supply Company; Newbert Implement Company; J. N. Blair Company; A. W. Morris & Sons Corporation; Fred W. Kiesel; Bonita Stock Farm; McCurry Photo Company; Sperry Flour Company; Ord L. Leachman; Emigh-Winchell Hardware Company; Dr. H. C. W. Litchenwalter; Geo. P. Robinson; News Publishing Company; Sandercock Land Company; Judge Peter J. Shields.

How the Horse Holds His Own

In the course of an address recently delivered by Wayne Dinsmore, secretary of the Percheron Society of America, before a meeting of Kansas horsemen some interesting facts and opinions regarding the effect of truck and tractor competition on the horse business were presented. Mr. Dinsmore said, in part:

"The competition of trucks and tractors has had a distinct influence. It has frightened thousands of farmers into a partial, or complete, discontinuance of horse breeding. Where it inhibited the breeding of mares of 1200 pounds or over to draft stallions this has been harmful. Where it stopped the use of small stallions, or the breeding of very small or decidedly inferior mares it has been a benefit. More good than harm has probably resulted, for we had a vast surplus of horses ranging from 1000 to 1400 pounds, and horses as a whole were being produced more rapidly than demand warranted. Especially was this true of the smaller, inferior kinds. A surplus of inferior horses drags down the price on good ones, so that every man who is producing good horses has reason to thank any factor which materially retards the breeding of scrubs, even though the same factor may temporarily depress interest in the production of real drafters.

"How far truck and tractor use may limit the field for drafters in the future no one with certainty can foretell. We do know that in the large cities trucks and teams appear to be reaching a balance. Teams are cheaper and more effective in short hauls, trucks superior in the long hauls. For a time trucks replaced teams at a very rapid rate in our large cities. Chicago, especially favorable to truck usage, has exact data on this. During the three years ending April 30, 1915, two-horse teams decreased 15 per cent, three-horse teams 30 per cent, and auto trucks one ton or over increased 441 per cent. During the next three years, ending April 30, 1918, two-horse teams decreased 21 per cent, three-horse teams only eight per cent, and auto trucks over one ton increased only 174 per cent—less than half as rapidly as the preceding period. Furthermore, there was an increase of two per cent in the three-horse teams in the last year, and this tallies with the statement of very competent draymen, who stated that there had been a tendency on the part of some firms to swing back to heavy drafters for more of their short haul work, for reasons of economy. In Greater New York there was during the two years and four months ending in March, 1917, a reduction of only 2100 horses, despite a great increase in trucks. This was a decrease of less than two per cent.

"The limit of profitable replacement appears to have been reached, or nearly so, and not 30 per cent of the heavy drafters have been displaced. The most experienced city transfer men who have been in the business for 20 years or more declare that teams can never be entirely eliminated in city work by trucks, as the increased cost of handling short haul traffic would be prohibitive; and these are men who have both trucks and teams in constant service, do draying on a tonnage basis, and are interested in the proposition solely from a financial standpoint.

THE BEST LINIMENT

OR PAIN KILLER FOR THE HUMAN BODY

Gombault's

Caustic Balsam

IT HAS NO EQUAL

For the Human Body — It is penetrating, soothing and healing, and for all Old Sores, Bruises, or Wounds, Felons, Boils, Corns and Bunions. CAUSTIC BALSAM has no equal as a Liniment.

We would say to all who buy it that it does not contain a particle of poisonous substance and therefore no harm can result from its external use. Persistent, thorough use will cure many old or chronic ailments and it can be used on any case that requires an outward application with perfect safety.

LAWRENCE Auto Power Equipment

Write for Circular.

408 Minnesota St. ST. PAUL, MINN.

LAWRENCE AUTO POWER CO.

"Tractor competition to draft horses on farms is a newer development, and has not yet reached its limit. The use of tractors will continue to increase up to the limit of profitable replacement, wherever that may be, and the farm power question will then go into a balance between tractors and horses, just as in our cities. The proportion of horses displaced on farms, however, will be much less than in the cities, for there are many factors on the farm which do not exist in the city to retard the use of gas engine power units. Among these the most important are soft ground, lack of skilled mechanics, distance from repairs, and the higher cost of gas, oil and repairs. Horses also cost less, whether reared or bought, and are maintained at a much lower cost, especially as regards shoeing and feed."

HORSE OUT OF CONDITION

On page 116 of the issue of the Cultivator of January 25 Dr. Petrie gave information regarding horse out of condition, and on this one of our subscribers, Dr. J. E. Minney, comments:

"Horse out of condition" in last week's Cultivator sounds like intestinal indigestion or pin worms. If the former the feces are probally acid. To learn if acid get a dime's worth of litmus paper. Press a piece of the paper on the fresh discharge and if the blue litmus paper turns red the discharge is acid — sour. This sour condition is brought on by the food rotting in the alimentary tract, stomach or intestines, one or both.

Treatment: Give 60 grains of calomel in some corn meal or rolled barley at one dose. In four hours give one-fourth to one-half pound of salts, according to the size and known habits of the horse. After the physic acts freely test the feces and if sour give from one-fourth to one-half pound of baking soda,—not baking powder,—in one-quart of water three times a day or until the feces become alkaline or neutral as shown by the blue litmus paper not changing its color. Change feed. The soda acts as a laxative, neutralizes the acid in the alimentary tract, enables the horse in crepitus, thus relieving the gaseous pressure and rumbling noise in the intestine.

JERSEY NEWS

F. W. Eleby of Modesto has sold to Geo. A. Moore of Ripon his well known herd sire, King Polo of Bleakhouse 101114. This is one of the best bred bulls in heavy producing lines in California. His dam has a register of merit test of 521 pounds of fat in a year as a two year old. His granddam a R. of M. test of 794 pounds of fat. Mr. Moore expects to mate him with the well known cow, Empress Lass, and other good females purchased from the Locke herd. Mr. Eleby has also recently sold to Mr. Esparta of Escalon the yearling bull Marco Polo a son of King Polo, and to the Hearst Ranch at Pleasanton the Jersey cows, Ruby's Eminent Lily, a granddaughter of the noted bull Eminent, Katherine of Belleview 4th, a daughter of the well known sire Gedney Farm Girl's Oxford, and three heifers, granddaughters of the herd sire King Polo Bleakhouse.

James A. Goodall of Keyes has just sold to the Hearst Ranch seven head of Jersey cows and heifers of Sophie's Tormentor blood. The Hearst Ranch owned by Mrs. Phoebe Hearst is founding a herd of registered Jerseys under the management of Chas. A. Adams.

C. D. Hayworth of Modesto has sold to W. C. Cornwell of Modesto a son of his herd sire, Laura's Altama Interest, out of one of his young register of merit cows.

Guy H. Miller of Modesto has recently sold to Herbert G. Wylie of Los Angeles the richly bred young bull Pearl's Altama Underwood, sired by his noted prize winning herd sire Altama Interest. The dam of this young bull is the well known cow Pearl of Venadera, register of merit test 702 pounds of fat in a year. Mr. Miller has also sold to C. H. Sturges of Yuma, Arizona, the young bull Altama of Palomar, a son and grandson of Altama Interest, out of the young register of merit cow Signora of Venadera, 427 pounds fat in a year.

W. J. Hackett of Ceres has sold a three year old daughter of his senior herd sire Signora Bruce's Fox to Herbert G. Wylie of Los Angeles. Mr. Wylie is founding a herd of registered Jerseys on his ranch at Naples in Santa Barbara County.

D. F. Conant of Modesto has just sold to Heitt Bros. of Modesto three cows for a foundation of a registered Jersey herd, and to Wm. Sproul of Modesto a young Jersey bull by Pansy's Gertie's Lad, and to Yeiser Hughson, a bull by the same sire.

THE ROSELAWN HERD OF SHORTHORNS

Dr. H. M. Elberg, Woodland, proprietor of the Roselawn herd of Shorthorns, is quite enthusiastic over the manner in which his two herd bulls, Crescent Dale and Roselawn Champion, are developing.

This herd, which, by the way, is one of the oldest established herds of Shorthorns in California, has shown marked improvement during the past few years and if present plans materialize it is destined to play a leading role in the beef cattle development of the Pacific Coast.

Old time breeders are familiar with the worth of the former herd bull, Gibson's Goods, by Choice of All, who was one of the greatest sons of the champion Choice Goods. He left a strong impression on the herd and was followed by Ringleader, a son of Ringmaster, one of the most popular show bulls of recent times. As the herd stands now the majority of the females represent the blood of these two bulls. When it became necessary to secure a bull to follow the two named above, Dr. Elberg selected Crescent Dale. This bull, who will be three in March, is a dark red son of Whitehall Rosedale by Avondale, the greatest son of Whitehall Sultan. Crescent Dale was not shown at the 1918 state fair owing to a slight injury, but would have made his initial show at San Francisco this month. He is a bull with ample scale, put up on nice lines and carries a wealth of flesh laid on very smoothly under a hide that is a delight to handle. He is fronted with an attractive head and sports a coat of curly mossy hair about his head and neck that one likes to see. As yet only a few of his calves have been dropped at Roselawn, but those seen are straight lined, thick fleshed youngsters, especially good in the quarters and carrying rich coats.

Assisting the above bull, and regarded by many as being a more promising bull, is the white Roselawn Champion. Visitors at Sacramento will recall this youngster. Under the capable management of Carl Johnson, he has done well and gives every appearance that he will develop into a rare bull. He is by Eastlawn Champion, a son of Champion of Scotland. The latter bull was regarded highly in the East and a few years ago was secured by the Paicines Ranch of this state. He died but recently. The dam of Roselawn Champion was Mischief E. 3rd, grand champion at the 1918 state fair.

With two such bulls to head the herd of 45 Scotch and Scotch topped females that constitute the breeding herd it is but reasonable to expect that the Roselawn herd will assume a commanding position in Shorthorn affairs in California.

COOPERATIVE MARKETING SAVES MONEY

Approximately $2154, or an average of 11.3 cents a pound on a carload of wool, was saved by the farmers of Wayne County, New York, through a cooperative arrangement started by the Wayne County farm bureau. When the cooperative enterprise was undertaken last spring the farmers were paid 67½ cents a pound. An additional dividend of $1528.01 has recently been received from the buyers, which brings the average price of the wool a pound up to 73.8 cents. When the interest is received the farmers will have been paid 75.3 cents a pound. The farmers of the county seem to think the farm bureau is responsible for a very successful undertaking.

A lot of our people who refer to foreigners as "wops" and "dagoes," stayed at home and made money, while the wops and dagoes fought for them in France.—Pajaronian.

Get more milk!

Get more milk from *your* cows. Others have proved by actual record that Dr. LeGear's Stock Powders make cows give from one-half to three-fifths of a gallon more milk per day. I *guarantee* that

All stock do better with Dr. LeGear's Stock Powders (my personal prescription)

They tone up the animal's system wonderfully, produce perfect digestion, increase the productive *value* of the feed, drive out worms, and keep stock strong and healthy. The formula for these powders has been worked out from my twenty-six years' veterinary practice, and *tried out* by thousands of dairymen and stock raisers, with big success.

This time of the year all stock *need* help—cows, horses, hogs, etc. You should get your cows in good condition for the freshening period; tone up your horses for hard spring work; and insure healthy, sturdy spring pigs. Feed your cows and sows Dr. LeGear's Stock Powders—give it to your horses. Besides being a splendid conditioner it is an excellent remedy for coughs, colds, distemper, worms, kidney troubles, loss of appetite, hide-bound, loss of flesh, etc., because it eliminates the *causes* of these ailments.

Dr. L. D. LeGear, V.S. (in Surgeon's Robe), Graduate of Ontario Veterinary College (Toronto, Can.), 1892. Nationally famous specialist in treatment of stock and poultry. 26 years' actual veterinary practice.

Get a package today — *at my risk*

Ask your dealer today for Dr. LeGear's Stock Powders. If my Stock Powders fail to do all that I claim for them, your dealer is authorized to refund your money.

Dr. LeGear's Poultry Powder keeps hens healthy, insures winter eggs, and means more profits to you.

Dr. LeGear's Antiseptic Healing Powder cleanses, dries and heals sores and cuts quickly. Handy to use.

Dr. LeGear's Lice Killer (powdered) rids your flock quickly of lice, protects chicks, etc.

Free sample—ask your dealer

Dr. LeGear's Remedies are sold by 40,000 of the best dealers—never by peddlers. Ask your dealer today for liberal *free sample* package of Dr. LeGear's Stock Powders or Dr. LeGear's Poultry Powder, and get a free copy of Dr. LeGear's Stock and Poultry Book. If your dealer hasn't samples and books, ask him to write us. We will supply him promptly.

Does *all* the Seed-Bed Work

In the important work of preparing the seed-bed, the Cleveland Tractor *does more than merely plow.*

Any tractor will plow.

But the Cleveland because of its track-laying construction travels *on top* of the soft plowed ground with harrow, seeder or other implements.

It does its work rapidly and economically *under conditions most difficult for the ordinary machine.*

The Cleveland, with its tremendous traction surface, *rides on top* of the ground like the great battle tanks—*without wallowing, sinking in or packing down the soil.*

The Cleveland uses its power *to pull the implement*—not to pull *itself* out of the ground. That is one reason why it operates on so little fuel.

The Cleveland will pull a roller over your young wheat *without injuring the crop.*

It does the hauling, the manure spreading, the ensilage cutting, the stationary engine work and the hundred and one *other* things that every farmer expects a tractor to do.

And it does the work *better,* as well as faster than before.

Orders for spring delivery should be placed *now.* Write for booklet and name of nearest Cleveland dealer.

BERKSHIRE CONGRESS AND SALE TO BE AT UNIVERSITY FARM

Written for California Cultivator
By Frank B. Anderson

Arrangements have been completed for a two-day Berkshire exposition at the University Farm, Davis, Wednesday and Thursday, February 19 and 20, under the auspices of the Western Berkshire Congress, which will hold its annual meeting and sale at that time.

One of the features of the meeting will be a fat barrow and carcass contest which will bring out two score or more of fat porkers to be judged in the showing and end with competition on the block. The Western Berkshire Congress directors have voted to place prizes of $25, $15 and $10 for pens of barrows, and $15, $10 and $5 for individual barrows. Bert Nixon, a Berkshire and Guernsey breeder of Yountville, has offered a registered Guernsey heifer as a grand champion barrow award.

A students' judging contest will be a special feature of the program. Gold, silver and bronze trophies will be awarded. Prof. J. I. Thompson has been selected to judge the barrows and place the first five breeding animals consigned to the sale.

The congress directors have arranged a combination guaranty sale of 50 bred sows, gilts and a few selected boars, representing the top herds of the Pacific Coast. The sale will be held on the second day of the meeting, starting at 1 o'clock on Thursday, February 20.

The annual Berkshire dinner will be held in the University Farm dining hall on the evening of February 19, at which time a number of leading hog men will talk on subjects of interest to swine breeders.

SHORTHORNS AND BERKSHIRES AT CARRUTHER'S FARM

W. M. Carruthers, who has transferred his Shorthorn and Berkshire breeding operations from Mayfield to his new ranch near Live Oak, is enthusiastic over the crop of calves now being developed. To date about 35 calves have been dropped and a total crop of about 50 or 60 is expected. The two herd bulls, Count Glory, grand champion at the last three state fairs, and Hallwood Villager, a white son of Village Flash, are evenly represented. It is too early to forecast accurately as to the merits of the two bulls, but the statement can be made with assurance that each has to his credit some exceptionally attractive prospects that promise much for the fall shows. Among the bull calves one of the most attractive is a red son of Count Glory out of a graceful dam sired by Ringmaster. A September calf by the same bull and out of an Evangeline dam has every appearance of developing into a bull of high order. He is a roan, very straight in his lines and a sagginess and thickness throughout that catches one's fancy.

A white-footed red calf by "the Count" out of a Fair Knight dam has a lot of good things about him. Hallwood Villager is responsible for a roan out of a good Orange Blossom dam by Fair Knight that will be a calf to reckon with. Another calf of promise is by Rookwood Monogram, the bull now in the Rossiter herd at Santa Rosa.

Several of the heifer calves show exceptional promise, but it will take time to rate them correctly. One little lady of rare quality and style is a red daughter of Count Glory and out of a March Violet dam. She has a lot of show ring attributes but is scarcely so thick or deep as two roan calves by Hallwood Villager — one out of the Hall-bred cow, Ringlet 2nd, by Prince Abbotsburn, a son of Lady Abbotsburn, one of the most celebrated show cows in the old Tebo Lawn herd; the other calf, also a roan, and very much after the same pattern is out of a daughter of Fair Knight. Perhaps one of the most valuable heifer calves on the farm is a rich coated red daughter, Hallwood Villager and out of Lady Dolly, a daughter of Lady Dorothy 5th. Mr. Carruthers regards the Dorothy stuff very highly and plans to develope this good family in the herd.

Among the older things are a number of good young bulls, several of which will doubtless find their way to good herds, as a number will be consigned in the forthcoming Shorthorn sale.

The good roan Broadhooks Sultana

2nd, shown last year has done well as has the white, Lady Ruberta. Carruthers has another heifer of the same age, and a white, Mayfield Ury by Count Glory, that has developed splendidly since the Sacramento show. She lacks the scale of the Ruberta heifer but at the rate she is developing she will be strong competition. She is rather a favorite with John Carruthers, who really deserves the credit for the condition the herd is in.

The Berkshire herd is in a strong position. Ames Rival 100th still holds his place as senior sire and is assisted by three good young boars. A son of Superbus is being used on the Ames Rival gilts with good results.

Recent sales from the Berkshire herd include a boar by the son of Superbus to the University of California.

Champions Are Bred
NOT MADE

Breeding animals that are sound in breeding, type and health make secure your future as a Berkshire breeder.

I am sending to the guaranteed bred sow sale of the Western Berkshire Congress five sows of championship blood and bred to champions.

No. 1—Princess Lee 48th.
No. 2—Princess Lee 49th.
No. 3—Princess Lee 50th.

Three litter sisters by Winona Lee Champion 6th, son of the famous Laurel Champion and out of a 650 pound litter sister to the Grand Champion sow of the world These are part of a litter of nine, six of which averaged 428 pounds at ten months. No. 1 and No. 3 are bred to Baron Duke 201st, Grand Champion boar at the Omaha National Swine Show; and No. 2 is bred to Rincon's Rival 2nd, Grand Champion boar at Oregon State Fair, 1917. Another good sow is Symboleer's Natomas Laurel, by a son of Laurel Champion and out of a daughter of the American Berkshire Congress Grand Champion Symboleer 5th. This sow is bred to Rincon's Rival 2nd, weighing 756 pounds at 22 months.

Miss Villa Rookwood, while a trifle under size, is a sow that will pay her way wherever she goes and is bred to Winona Lee Champion 6th.

THE BOAR

Winona Lee Champion 6th, a son of Laurel Champion, will also sell. This boar has good length, a well-set, meaty ham, strong in the back and feet, a remarkably good heart girth and carries his depth his entire length. He is guaranteed a sure breeder, has a very typy head and his future will be much greater at the head of some good herd. I have several of his daughters and a number of sows bred to him in my herd and this is my only reason for disposing of him.

Keep your eyes on these animals day of sale.

Sandercock Land Co.
906 K St., Sacramento

In charge of Natomas Land Sales

Veterinary

Answers in this column by Dr. Wm. Petrie, 2714 South Harvard Boulevard, Los Angeles, are without charge. For immediate mail answer remit $1.00. In writing questions give full symptoms or particulars of injury of animal.

Unsigned communications receive no attention.

Barrenness

I have a two year old heifer that has been coming in heat for the last year and I have the bull with her often without being able to get her to breed. Can you suggest any medicine or treatment that will get her with calf? I have read that one pint of hempseed given regularly for a couple of months is beneficial. If you think hempseed is good where could I get it?—Subscriber, Loleta.

We know of no value of hempseed as a medicine for man or beast. It is listed among the medicines but no action is given so it can be of little value. She may be completely barren or there may be an obstruction to the entrance of the womb. If she is of a very valuable strain have her examined by a veterinarian and he may be able to find the cause of the trouble; otherwise it would be best to send her to the butcher.

Blindness

I have a mare that went totally blind almost over night. She seemed all right when put in the stable in the evening. The next morning she stepped high and was afraid to walk out when led by the halter. The eyes are not watery nor is there any film on the surface but the pupils have a dead and somewhat milky appearance. She has a good appetite and seems well in every other way although she has fallen off some in flesh since going blind. She has not been worked hard nor had any blow that I know of. Can anything be done for her? — Subscriber, Raymond.

This is one of those unaccountable instances that occur from time to time. Something went wrong with the circulation of blood to the eyes or with the nerves that supply the eyes with nerve force. These cases are of such rare occurrence that no one has had a chance to find out anything about it. Nothing that we know of can be done for it.

PURE PORK SAUSAGE

To each 100 pounds of meat, preferably 60 to 65 per cent lean and 35 per cent fat finely ground, take one and one-half pounds of salt, four ounces of black pepper, two ounces of sage and one ounce of nutmeg. Mix all together well, sprinkle over the meat and mix thoroughly.

If the sausage is to be kept for several months it should have two pounds of salt instead of one and one-half pounds. It should also be stuffed in casings, or packed in jars and covered with lard. For convenience and to insure keeping, it can be made into cakes, fried, packed in containers and covered with lard.

Carruther's Shorthorns and Berkshires

Choice collection of breeding cows—mostly Scotch—and representing the leading families, headed by Count Glory, grand champion at the last three state fairs, and Hallwood Villager. Bulls for sale at reasonable prices. Berkshire herd headed by the noted boar Ames' Rival 100. Correspondence invited.

W. M. CARRUTHERS, Live Oak, Cal.

Buy These Berkshires at Your Own Price

We are consigning the following Berkshires to the annual

BERKSHIRE CONGRESS SALE

2 GILTS
Sire { Ames' Rival 70th No. 209850, Grand Champion boar State Fair 1918.
Dam { Winona Artful Laurel 9th No. 229354, member of first over one year herd, California State Fair 1918.
Farrowed March 2, 1918. Litter of 10

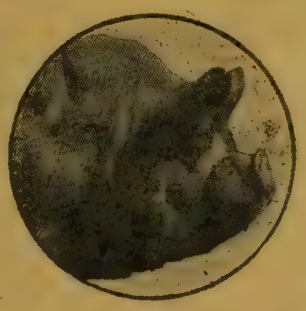
These gilts have everything in their favor and are well worth the attention of any breeder who wants better Berkshires. The sire and dam are both prize-winners at the 1918 State Fair. We consider their breeding the best in our herd.

2 GILTS
Sire { Winona Compton Champion 8th No. 250345.
Dam { Mills' Luster Girl 2d No. 255633.
Farrowed March 5, 1918. Litter of 10.

The sire Winona Compton Champion 8th is a son of Laurel Champion, who was many times a prize winner. The dam, Mills' Luster Girl 2d was raised on the Mills Orchard Ranch. She is an excellent brood sow.

2 GILTS
Sire { Mayfield Rookwood 2d.
Dam { Miss Rincon A No. 247338.
Farrowed May 8, 1918.

1 BOAR
Sire { Ames' Rival 70th No. 209850.
Dam { Forest Grove Laurel 9th No. 221278.
Farrowed April 3, 1918.



With popular Grand Champion blood on both sides this boar has a lot to live up to and he surely can do it.

All have been selected as worthy representatives from our great herd and are the sort that will prove profitable to the buyer.

JAMES MILLS ORCHARD CORPORATION, Hamilton City, Calif.

Berkshires for Profit

50---Selected Bred Sows, Gilts and Boars---50

Annual Congress Guarantee Sale

University Farm, Davis, Cal., Thursday, Feb. 20

The Offering:

Following an established precedent, the Western Berkshire Congress offers for sale 50 head of carefully selected bred sows, gilts and boars. Every animal selected for this sale represents, to a high degree, the most acceptable type of modern Berkshire—size, quality, vitality, bone and prolificacy being insisted upon. Every sow listed is guaranteed to be a breeder or purchase price refunded.

Berkshires are the profitable hog. They are money makers. There never was a better time to enter the hog business than NOW. The scrub must go, and this sale offers an opportunity to replace the low producing scrub with a profitable pure bred at a reasonable price—your own price.

Remember, every bred sow sold is a guaranteed breeder and has been immunized from cholera.

The few boars to be offered are of the highest class and fit to head good herds or go into any kind of a herd and sire the kind of pigs that will be profitable. The blood lines are the best, the type is right, the quality is first class and the price—your own.

Breed Berkshires—The Standard Hog, the Hog of Quality, Style and Vitality

The Congress Meeting:

The Annual Meeting of the Western Berkshire Congress will be held the day preceding the sale. Matters of vital interest to the hog industry will be discussed by men competent to talk on every angle of the business.

A Fat Barrow Contest will demonstrate to all the reasons why the Berkshire is the Universal Breed.

A Carcass Contest will be conducted as a demonstration of the killing qualities of the Berkshire.

A Students' Judging Contest will bring out emphasis on the finer points of this Great Breed.

The Berkshire Dinner will be held the evening before the sale.

A 2-DAY BERKSHIRE EXPOSITION

Meeting: Wednesday, February 19th. Sale: Thursday, February 20th, 1 o'clock.

Catalogs and other information may be secured by filing applications with the Secretary.

Los Angeles, Calif.
Dec. 10, 1918.

Germain Seed & Plant Co.
Sixth and Main Streets,
Los Angeles, Calif.

Gentlemen:

Replying to your recent inquiry asking if I had any occasion to buy Hairy Peruvian Alfalfa this season and what I think about it:

Will say, that I purchased some in the San Fernando Valley which was grown from Germain's Proven Hairy Peruvian seed, and it was the best hay I ever had in this market. It not only sells for more money than the common alfalfa hay, but it also makes satisfied customers. I am looking forward to the time when this will be the only variety grown.

Yours truly, J. R. Cale

THE SELF-OILING WINDMILL
has become so popular in its first four years that thousands have been called for to replace, on their old towers, other makes of mills, and to replace, at small cost, the gearing of the earlier Aermotors, making them self-oiling. Its enclosed motor keeps in the oil and keeps out dust and rain. The Splash Oiling System constantly floods every bearing with oil, preventing wear and enabling the mill to pump in the lightest breeze. The oil supply is renewed once a year. Double Gears are used, each carrying half the load.

We make Gasoline Engines, Pumps, Tanks, Water Supply Goods and Steel Frame Saws.

Live Stock News Notes

Wisconsin Holstein Breeders' Sale

The Wisconsin State Holstein Breeders' Sale will be held March 12 and 13 at Fond du Lac. F. H. Everson of Lake Mills will manage the sale.

Holstein Guaranty Sale

The date of the Holstein Guaranty Sale has been set for March 27, and will be held at state fair grounds, Sacramento. The highest record cattle ever sold in the west have already been entered, according to a statement made by C. L. Hughes of California Breeders' Sales and Pedigree Company, who will manage the sale.

Black Patti on Test

Black Patti, a great Holstein cow owned by Walter F. Mitchell, Visalia, recently completed an official record of over 26 pounds butter in seven days.

New Hog Feeding Plant at Willows

The Western Rice Co., who control large holdings in the Willows district, have recently established a hog feeding plant just south of that town. Perry Garland, who formerly operated in the Imperial Valley, is in charge.

The plant, which is one of the most complete in Northern California, consists of a central house with adjacent lots. The house is a two story affair, so arranged that the feeding is done from a central alley. The sleeping quarters are on the second floor and are reached by means of an incline. The capacity of the plant is 500 head.

Mr. Garland states that hogs of good thrift and quality are purchased at weights averaging between 100 and 125 pounds. Upon arrival at the plant they are gradually brought onto a full feed, which is usually a mixture of rice and wheat by-products, barley and corn fed as a wet mixture. The cost of the feed is said to be about $60 the ton and it is claimed that eight pounds of the mixture will produce two and one-half pounds of gain. In other words, at present prices, 24 cents worth of feed will produce 41.25 cents worth of pork.

Mr. Garland also claims that hogs so fed kill out exceptionally well and do not register a heavy shrink in shipping.

New Duroc Herd for Glenn County

F. D. Barr of San Francisco, who is installing a herd of Durocs on his ranch near Orland, has recently purchased nine bred gilts from H. P. Slocum & Son, Willows. Mr. Barr plans to build up an extensive herd of pure bred hogs and is selecting his foundation stock with care.

Witherow's Durocs Now in Sutter County

H. C. Witherow, whose herd of Durocs was maintained near Palo Cedro, has recently moved his herd to his ranch south of Live Oak. Mr. Witherow's herd boar is Johnson's Defender Jr., a son of Johnson's Defender and Cherry Chief Lady. Cherry Chief Lady will be remembered as the 1917 grand champion at Sacramento.

Mr. Witherow states that he has never noted a stronger demand for Durocs and he is impressed with the quality of stuff insisted on by buyers. Several of the young sows now in the herd are daughters of Model Col—the University Farm boar.

Kounias Makes Good Holstein Sale

George Kounias of Modesto, who breeds Holsteins and Berkshires, reports a recent sale of three females and a young bull to J. R. Coons Modesto, for $2500.

The Greatest Cattle Sale

The most remarkable sale of pure bred beef cattle ever made was held last month by Mousel Bros., Cambridge, Nebraska, when 50 head of Hereford bulls and cows were sold for $192,250 — an average of $3845 per head.

Practically the entire offering represented a concentration of Anxiety 4th blood and nearly all the animals sold were direct descendants of the Mousel herd sire, Beau Mischief, thus demonstrating the value of a superior sire.

Superior Domino fetched $21,000 and the cow, Mariana 8th, brought $7200.

One of the features of the sale was the number of new names noted in the list of buyers.

More Eastern Herefords for California

Clifford B. Harris, Los Angeles, Western representative of the Hereford breeding establishment of O. Harris & Sons, Harris, Missouri, states that he is expecting a shipment, consisting of four or five carloads, of bulls early this month.

Mr. Harris recently furnished a Repeater calf to the Sierra Vista Vineyard Company of Minturn, for $2500.

For a good many years Harris Herefords have dominated the show rings of the Middle West and at the 1918 American Royal and International cattle from this establishment wrote some very brilliant records. Repeater, Jr., the two year old son of the famous Repeater was senior and grand champion at both shows, but each time he had to beat his half brother, Repeater 129th, who in turn won the junior championship only after he edged ahead of Repeater 191st. A further fact of interest is that Repeater 7th Model a son of Repeater 7th sold in the association sale during the Royal, for $24,000.

Tulare Jerseys in Demand

A. A. Jenkins of Tulare reports having sold a young son of Gertie's Son's Victor to C. W. Brown of Tulare. The calf is out of Glenwood Clara 2nd with a recently completed register of merit record of 621 pounds butter. Her sire and dam and each of her grandsires and granddams are in the register of merit. Her dam holds a record of 630 pounds butter; her maternal granddam 631 pounds butter and her paternal granddam 767 pounds 15 ounces butter.

Gertie's Son's Victor is proving a sire of merit and Mr. Jenkins states, that without exception, his daughters are producing more than their dams.

Another son of the above bull and out of Owl's Witch has been selected by Jacob Sifers of Tulare. This youngster is not only a splendid indi-

River Bend Farm St. Helena, Cal.

vidual but is backed by high production—six 1000-pound records appearing close up in his pedigree.

Mr. Jenkins also maintains a herd of Durocs and has made recent sales of bred sows to A. V. Bennett, R. T. Trogan, and J. C. Rodgers, all of Wasco; Harry Helsey of Shafter, and Mrs. H. B. Tout of Sultana.

Fifty Durocs Average $501

Pine Crest Farm, Charleston, Mississippi, recently sold 50 head of Durocs for an average of $501. P. C. Orion Lady A, junior champion the National Swine Show was included in the offering and sold to Enoch Farms, Fernwood, Mississippi, for the record price of $2850.

P. C. Orion Lady A is a daughter of Orion Cherry King 11th and out of a Jack's Friend sow. A litter mate brought $1500.

In the same offering a 10 month old boar by Scissors, sold to Fairacres Farm, Gregory, Arkansas for $2300.

University Farm Sells Guernsey Bull

Peter Saxe and Son of San Francisco have secured from the University of California, a 17 month old Guernsey bull sired by Squire of Richneck Farm, and out of California Questa Queen. The dam is now on test and in five months has produced 300 pounds of buter fat.

Gable Herefords to Hawaii

H. H. Gable of Esparto has sold his entire crop of Hereford bull calves to James Wight who is now in this country purchasing live stock for two Hawaiian Island ranches.

The Gable bulls were bought for Harold W. Price of the Island of Maui. The calves were all sired by Donald Hope a Splawn bred bull sired by Beau Donald 31st by Beau Donald, and out of Bright Hope, a cow that was a splendid producer in the University of California herd.

Mr. Gable is president of the Pacific Coast Hereford Breeders' Association.

Eastern Offer for Champion Berkshire Sow

Castle View Ranch, of Calistoga, has been asked by the secretary of the American Berkshire Association, for a price on Rookwood Lady 100th.

This sow was made grand champion at the Omaha National Swine Show and has been pronounced by competent Berkshire breeders as worthy of the position she occupies in the breed.

Mr. O'Connor, her owner believes she will do the breed as much good by remaining in California as if she were sent East, consequently has declined to price her.

The Castleview herd, which is one of the newer herds of this state, represents very largely the top selections from the Brush herd and the Hopland herd formerly owned by A. W. Foster, both of which were purchased by Mr. O'Connor. In order to properly care for the expanded herd more land was needed for pasture and 60 acres have been added to the ranch. This land will be used for pasture and a deep well is being drilled to supply water for irrigating the alfalfa.

Guilford May Go to England

W. S. Guilford, of the Butte City Ranch, Butte City, is considering making a trip to England within a year for the purpose of visiting Shorthorn, Shropshire and Berkshire breeders. If plans materialize Mr. Guilford will perhaps make an importation of cattle, sheep and hogs for his plant in Glenn County.

Mr. Guilford is enthusiastic over the prospects for the pure bred live stock business in this state and recently expressed the belief that during the next ten years California will take a prominent place among the great live stock states.

Several years ago Mr. Guilford established a herd of Berkshires, later he added a herd of Shorthorns and more recently a flock of Shropshires were put in.

Polands Profitable

Wm. Bernstein, the Poland-China breeder of Hanford, divides his time between his business in the city and his ranch. He has found the Poland-China very profitable as his sales have totaled a little more than $14,800 the past 15 months. King's Big Bone Leader, sold in one of the previous Hanford sales was from his herd.

Buys the Toppers

W. L. Hoag & Son, Hanford, are establishing on their Lendorris Ranch what they hope to make one of the leading Poland-China herds of the state.

Mr. Hoag has been a liberal buyer at the sales and his purchases are usually the highest priced animals sold.

Holstein Bulls

F. D. Ross, of Hanford, who is breeding both Poland-Chinas and Holsteins has recently sold young bulls to C. M. Blowers, G. L. Fletcher and Ray Hall, all of Kings County.

Bountiful

Beautiful Bell might well be termed Bountiful Bell, as she has returned her owner, John Bernstein, the Poland-China breeder of Hanford, $2000 with her past three litters and is just now weaning her fourth.

Ramsay Buys Hereford Bull

R. M. Dunlap reports having recently purchased a young Hereford bull, for T. H. Ramsay of Red Bluff. The bull was secured from Miller and Lux

New Tractor Facts
In This Free Booklet

How to make comparisons
How to get the most for your money

No farmer should try to decide which tractor is best until he has studied the latest offerings of the J. I. Case Threshing Machine Company, builders of power farming machinery for 77 years.

We have just published a handy little pocket manual which describes Case Kerosene Tractors and which gives a man the needed information by which he can make comparisons. This is the only way to get the facts.

Our two new sizes, the Case 10-18 and the Case 15-27, both bring betterments and finer materials — items which mean much to performance and long life.

Other Case Booklets

Similar booklets have been prepared describing Case Steel Threshers, Case Silo Fillers, Case Steam Engines and Case Hay Balers. Write for the ones you are interested in. Sent Free.

Read Before You Decide

Learn about our one-piece main frame. Our four-cylinder engines. Our conservative rating for belt and draw-bar work. Note how many operations these tractors can be used for. Examine the pictures of working parts. Note the fine materials. Such as traction gears of cut steel, enclosed and running in oil. See how we have placed the belt pulley directly on the crank shaft. Study the Case air washer and the themostatic control of cooling system. Learn these and other vital facts. Then compare Case Tractors with others. See if you can find elsewhere all we offer. Your search, we are sure, will result in your decision that Case builds the finest, and that "It's Better to be Safe than Sorry."

A copy of this booklet—"The Case Kerosene Tractor Booklet"—will be furnished by any of our 9000 Case Dealers. Or write direct to us. A post-card will bring it.

and will be used on a Nevada ranch operated by Mr. Ramsay.

McCracken Buys Champion Poland

Leo McCracken of Ripon purchased King's Big Bone Leader, grand champion Poland-China boar at the 1918 California State Fair, in the Gatewood & Son dispersal sale, for $700.

King's Big Bone Leader proved to be one of the most popular champions at the fair. He is sired by Big Bone Leader and is out of Victoria Model 10th.

The general average of the above sale was $125.

Butte City Ranch Initial Sale

W. S. Guilford, who together with W. P. Dwyer owns the Butte City Ranch, announces that they will hold their first public sale of live stock, March 1, at which time they will offer 20 registered Shorthorns, 30 registered Berkshires, 20 registered Shropshires and 15 Welsh and Shetland ponies.

It is planned to make the sale an annual event. The Butte City Ranch herds and flocks have distributed a large number of pure bred live stock to farmers throughout the state.

A catalog of the sale entries may be had by applying to the secretary, Homer Hewins, Jr., Calistoga.

KINGS COUNTY POLAND-CHINA SALE

Washington's birthday will be fittingly celebrated by the Poland-China breeders of Kings County by the holding of their bred sow sale.

These sales, established some three years ago, have become a permanent fixture and are looked forward to, twice a year by those interested in this breed of swine.

Animals are being consigned to this sale that the breeder would hesitate pricing at private treaty but for the fact that, to convert new breeders to the Poland-China ranks, nothing but choice animals should be offered.

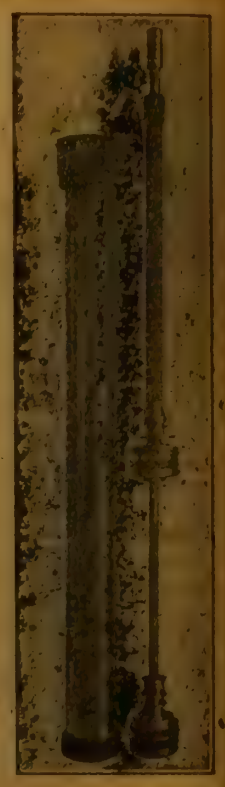
While this sale will consist mostly of bred sows it has been decided to offer a few open gilts and some young boars whose breeding marks them as excellent prospects.

The animals are from the well established herds of M. Bassett, Wm. Bernstein, F. D. Ross, W. L. Hoag & Son, W. S. Trewhitt, J. A. Crawshaw, C. J. De Raad, John Bernstein, C. A. Vaughn, W. S. Hubbard, H. C. McCune and Dimmick Bros. and the guarantee of both the breeder and the association is back of each sale.

In the sale there will be sons and daughters of King's Big Bone Leader, grand champion boar at the state fair last fall and recently sold at public auction for $700. A variety of blood lines of the most approved Poland-China breeding will be in the offering and those desiring to acquaint themselves with the individual breeding can secure a catalog by writing F. D. Ross, Secretary, Hanford.

DRY CURE FOR HAMS, SHOULDERS AND BACON

Meat cured with this formula has been found palatable and sweet after several years, says L. E. McGinnis of the University of Missouri college of agriculture.



To each 100 pounds of meat use eight pounds of salt, three pounds of warm syrup, (any good syrup can be used) two ounces of saltpeter, three ounces of black pepper and two ounces of red pepper. All these ingredients should be thoroughly mixed together. It will first lump and darken. When these lumps are rubbed out the ingredients are ready to be rubbed in the meat and should make a coating over it. The syrup causes it to stick.

The meat can be put into a barrel or box, or be piled on the floor or table. There will be drainage which is best taken care of in a barrel or tight box. Leave the meat six weeks in the cure and the extra heavy pieces a week longer. If you wish to smoke it, take it right out of the pile and hang it in the smoke house without washing. Smoke it until you get the required color over not too hot a fire.

Imitation Milk

The state dairy bureau is after the imitation milk manufactures, at least the bureau is encouraging the passage of Senate Bill No. 264 and its companion, Assembly Bill No. 534. Chairman A. R. Bates of the bureau writes:

"These bills to recognize, regulate, and properly control imitation milks are entitled to the support of everyone who believes in pure food and that products should be sold for exactly what they are. At the present time our dairy laws, which were framed when the substitution of alien fats for butter fat in milk was unthought of, must be amended to control this new class of products. Just as the sale of oleomargarine and filled cheese is regulated the above bills will regulate imitations of milk and properly protect the public from the menace which the loss of milk fat from the dietary would be. Milk fat being absolutely necessary to the sustaining of human life, it would be a national calamity if imitation cocoanut or other vegetable oil milks are unregulated and allowed to discourage the breeding of dairy cattle and the production of high grade milk.

"The state dairy bureau, health officials, dairymen's associations, creamery officials, in fact all handlers of milk products strongly endorse these bills and feel that the production of milk in California must be protected from the assaults of such imitation products from other territories."

The title of the bill is: "An act to regulate the business of producing, buying or selling imitation milk products, providing for the licensing of said business by the state dairy bureau." Section 1 entire is as follows:

For the purposes of this act certain manufactured substances, certain mixtures and compounds shall be known and designated as "Imitation Milk," namely: (a) any mixture or compound composed of skim milk or condensed, evaporated or powdered skim milk and any edible oil or fat other than natural milk fat, whether with or without any other ingredient or ingredients; (b) any mixture or compound made in imitation or semblance, or having the appearance or semblance, of milk or condensed or evaporated milk, or when so made or having such appearance or semblance calculated or intended, whether by intent of the compounder or other person, or by reason of the appearance or other characteristic of the mixture or compound, for use or disposition as or for milk, or as for condensed or evaporated milk, or to induce its purchase, or use as or for milk or condensed or evaporated milk."

Glenn Poland Breeders to Organize

R. J. Yates, Orland, one of the pioneer Poland China breeders of Glenn County, states that the Poland China breeders of that county plan to form a Glenn County Poland China Breeders' Association and that it is expected about 25 charter members will be enrolled.

Mr. Yates, who is one of the most enthusiastic swine breeders in Northern California, is building up a first class herd and expects to enlarge his herd to 50 sows. Much of his breeding operations will be centered around his herd boar Long Jumbo, a son of Mouw's Smooth Jumbo and Extra Long 7th by Big Jumbo 2nd.

Long Jumbo was three years old last fall and was grand champion in 1917 and 1918 at the Orland Fair. Assisting the above boar is Yates' Big Orphan by Hather's Big Orphan and whose dam was a daughter of Hather's Hadley 2nd. Hather's Hadley 2nd was the sire of Varsity Hadley, the boar Professor Thompson secured from the Iowa State College to head the University of California herd of Polands. Varsity Hadley was the sire of winning barrows at the 1917 International and was also the sire of the grand champion barrow of the 1918 show.

DEHORNING OF CATTLE

Methods of dehorning cattle have been the subject of demonstrations held by cattle specialists of the United States department of agriculture. The demonstrators show how to remove horns with clippers and saws, and with the use of caustic soda and caustic potash to prevent the growth of horns on calves. Dehorning chutes, for holding cattle while being dehorned, emphasized the importance of using them instead of throwing the animals with ropes, tying them to fences, or similar methods which are unsatisfactory.

The method of dehorning depends in each case upon the age of the cattle. Demonstrations with young calves showed how the growth of horns can be prevented by properly applying caustic soda or caustic potash. Older calves and other cattle were dehorned either with the saw or clippers. While clippers remove the horn more quickly and with less pain to the animal, the saw has the advantage of not crushing the horn, especially in the case of old animals whose horns are hard and brittle. Neither does the saw cause as much bleeding, since by lascerating the blood vessels it causes a clot of blood to form quickly.

HOLSTEIN ASSOCIATION OF AMERICA

The meeting of the executive committee of the Holstein-Friesian Association of America held at Detroit late in December resolved to recognize the Canadian Herd Book, partial agreement having been made between Secretary Houghton of the American association and Secretary Clemens of the Canadian association.

"All Holstein-Friesian cattle entering the United States from Canada shall be registered in the Holstein-Friesian Herd Book of America and all Holstein-Friesian cattle entering Canada from the United States shall be registered in the Holstein-Friesian Herd Book of Canada on the strength of the official certificate of registry from the country of origin without the registration of ancestors."

The agreement will have to be subjected to the approval of the Canadian and American associations at the annual meeting of members.

Merci Lad Korndyke Burke

Son of De Kol Hengerveld Burke who has a long list of A. R. O. daughters with records up to over 35 pounds butter in seven days, and out of Winnie Korndyke Cornucopia De Kol who made 31,034.1 pounds milk in one year and was the first cow in California to make over 1200 pounds butter in one year. A few of his good sons out of excellent dams for sale.

SANTA ANITA RANCHO — *Santa Anita, Cal.*
Anita M. Baldwin, Owner — *W. H. Taylor Supt.*

The Proof of the Pudding

KING KORNDYKE PONTIAC 20TH as a calf looked like the real bull to head our herd, adding to his great individuality the backing of a pedigree with an unbroken line of great producing dams and type of the highest character. The price of $6500.00 which we paid for him was really a minor consideration. Now that his calves are coming on we know that we made a fortunate choice, for they are certainly beauties. His oldest son in our herd was sold at 40 days of age to become the future head of a newly established Stanislaus County herd.

And the last six calves by King have all been heifers, mostly white in color, beautiful individuals, and every one of them has large well placed teats, just what we expect from the great uddered cows in his ancestry.

Better get in touch with us for one of his young sons for YOUR herd. We already have requests for reservations of unborn calves if they are bulls. Satisfaction of the buyer is our first consideration, and our prices are reasonable.

Our Entire Herd is Tuberculin Tested

Tulare Holstein Farm

W. J. Higdon, Owner TULARE, CAL. H. L. Redd, Herdsman

Prince Hiske Walker

He is by Prince Gelsche Walker and out of Hiske of Riverside, being therefore full brother to Lady Hiske Walker, 34.25 pounds butter in seven days as a junior four year old, former state record in class.

His offspring are uniformly straight, vigorous, and well marked. A few of his young sons for sale.

W. F. Mitchell, Owner Visalia, Cal.

Sir Aaggie De Kol Acme 2nd

Five of his seven nearest dams average:
Milk one year....24,089.88 pounds
Butter ..... 1,105.07 pounds

This butter average is equalled by only one other bull of service age in the world. Buy your next bull from

Eldorado Herd
Alex. Whaley, Owner Tulare, Cal.

A REAL DAIRY BULL
From a 900 Pound Dam

Do you know that it takes a real cow to produce 900 pounds butter in a year? And do you know what a real bull from a producing sire and such a dam would be worth to your herd?

We can offer just such a bull and at a price within the reach of any progressive dairyman.

His dam is about to complete a year right around 900 pounds with second calf and in addition to this she has the type that you would like to breed into your herd, a show cow with beautiful level udder and large well placed teats.

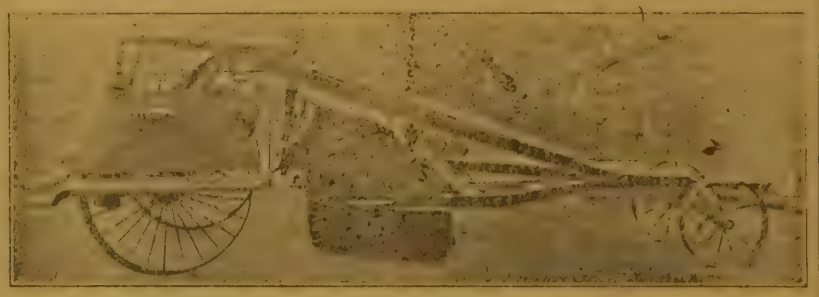
For seven days she has a 26 pound record, but you will be more interested in what she did the other 358 days.

His sire has produced five two year olds (first tested) that average 753 pounds in a year.

His dam and sire's dam average 990 pounds butter in one year and over 29 pounds butter in seven days.

In addition to this he will suit you as an individual, light in color and past eleven months old. Price $300.00.

A. W. Morris & Sons Corporation
Woodland, Cal.



Our Senior Herd Sire is KING KORNDYKE HENGERVELD ORMSBY 7th
Five of his sisters sold at public auction for $23,800, an average of $4760.
This blood has made some of the world's greatest producers.
Our junior herd sire is TOYON KING KORNDYKE SOLDENE, son of a 33.23 pound daughter of King Hengerveld Aaggie Fayne.
Young bulls for sale. No females.

More Pure Bred Beef Herds Needed

Written for California Cultivator By R. P. Royce

CALIFORNIA offers many unusual opportunities in live stock production, but we doubt if any field is more inviting, or holds greater prospects, than will be found in the production of pure bred beef cattle of any of the recognized breeds.

One who takes time to investigate the situation will not fail to be impressed with this fact.

California will always figure as an important cattle production center. There are throughout the state thousands of acres of land that can only be used to advantage as grazing areas. There is scarcely a county in the state that does not contain such areas and it is certain that in the future much land now utilized in other ways will be turned to cattle production.

It is inevitable that sooner or later the problem of soil fertility will force many ranchers to add live stock to their operations and it is equally certain that many will find that a herd of beef cattle will fit into their plans more satisfactorily than will other classes of live stock.

Now granting that the above is true, and few will question the statements, a basis is found for confidence in the outlook for the future. But there are other reasons why the beef cattle industry is attractive. California breeders are producing only a small percentage of the bulls used on the ranges of this state. Every season there are hundreds of bulls, pure breds and high grades, shipped in from the East.

There is no accurate means of knowing the number of bulls "imported" each season, but the number will reach four figures.

In the past the great majority of bulls used on the ranges have been grades—and poor grades at that. With cheap production costs the cowman was little concerned about the quality of bulls used—he just wanted a bull—a red bull—and the cheaper the better. But times have changed. Production costs have increased to the point where many outfits are finding it difficult to show a profit. Yet these outfits are not going out of business. They will continue to operate, but they are looking about for every means that will cheapen their costs. The surest way to trim their costs is through the use of better bulls, and more advanced and business like methods of range management. And the business will develop along these lines. Nothing is more certain. As a matter of fact, the past few years have registered an increasing demand for bulls of better quality because it has been demonstrated on every hand that a well bred bull used on the average run of range cows will sire calves of better type and quality that will weigh more at a given age than calves from a common bull. If an outfit can, through the use of better bulls, reduce the age at which their steers are sold and at the same time increase the market weight, more cows can be handled on the same amount of range; more pounds of beef can be marketed and, because of better quality, sold at a higher price per pound; they are rather certain to make a wide market for well bred bulls. And that is just what is happening in the range business of this state and accounts for the fact that California breeders are always sold out of bulls and buyers find it necessary to bring in train loads of bulls each season.

We know a good many range operators and there is not one who would not rather secure his bulls in California than outside the state. They know that a home bred bull will give them better service because he is acclimated and they figure that they could buy better bulls for the same money than Eastern stuff costs laid down, because the expense of traveling or commissions and freight could be applied to the purchase price.

Another fact that should not be overlooked is the probability of this state, following the lead of other Western statees, enacting legislation relating to the quality of bulls used on the open range. Several states require that only pure bred bulls be used on open ranges and the cattle interests of this state are considering such legislation. When the law becomes a fact the demand for good bulls will be greatly stimulated.

The above facts all indicate the possibility of the future from the progressive cattleman's standpoint. With a wide and unfilled demand existing now and the knowledge that cattle improvement is inevitable, and a comparatively few men making an effort to meet the situation, is there not ample reason for urging many more herds of pure bred beef cattle?

The pure bred beef cattle business of this state could be increased ten fold and still not meet the demand. It should not be imagined that California operators furnish the only outlet—Nevada and Oregon and other Western states will absorb California bred bulls, and there is an inviting field developing in the Pacific islands, Mexico and the West Coast of South America.

During the past year some very high class cattle have been loaded at San Francisco for shipment to the islands. Most of the cattle were bought in the East for the very good reason that they could not be found in this state, yet every one of the buyers would prefer to have filled their orders from Pacific Coast herds had the class of cattle been available.

Herds of pure bred beef cattle will solve many a rancher's problem. Such herds will go far toward eliminating the acute labor problem, will furnish a profitable outlet for vast quantities of feed now going to waste on many grain farms and will prove the salvation of many ranches on which the fertility of the soil will some day be the real problem.

Stock Notes From Arizona

State Dairy Commissioner of Arizona W. A. Barr has issued a circular letter to dairymen asking for improvement in sanitary conditions.

The Maricopa County, Arizona, Dairymen's Association, cooperating with the creameries and condensed milk plants of the Salt River Valley, are offering prizes to the boy or girl in the public schools of Maricopa County who writes the best essay on the subject "Why the dairy industry should be developed for Maricopa County." Prizes of $5.00, $4.00, $3.00 are offered. The same prizes will be offered to the writer of the best essay on the "Value of Dairy Products as Food." This is under the general supervision of the state dairy commissioner and assisted by some prominent educators of the Salt River Valley.

E. F. VanKirk, a prominent Salt River Valley dairyman states that he has just sold nine pigs which were grown on skim milk until about six months of age. During the last 30 days they were fed 1800 pounds of ground milo and cotton seed in an amount of about one pound of the cotton seed meal to 100 pounds of pork together with skim milk. Estimating the value of skim milk at 65 cents per cwt., he states that the profit on finishing these pigs was about $40 or between $1.25 to $1.50 a day for the bunch. Pigs averaged 194 pounds each when ready for the butcher.

A Salt River Valley dairyman stated that during the month of December, he sold $208 worth of milk from seven cows. This milk was sold to the condensed milk factories at the prevailing price.

LIVE STOCK QUERIES

Feeds for Pigs and Sows

How many pounds of barley will produce one pound of pork when the hog is in prime condition. About how much barley should be fed to a brood sow to keep her in good condition?—M. J. M., Peelga.

The amount of barley—or any other feed—required to produce a pound of pork varies with the age of the animal, the individuality and the general plan of feeding. With pigs weighing about 100 pounds, fed in a dry lot and furnished no other feed, around five and one-half to six pounds of barley

Retained After-birth

Cows can be made to clean easily without using force.

When cows do not clean properly after calving, it indicates a germ infection which is likely to run through the entire herd and result in Abortion and Barrenness.

The after-birth should be removed at once without force by means of the B-K douche and the cow treated to prevent her becoming an aborter or sterile. Authorities state that while there is no absolute cure for abortion and sterility, nevertheless the infection can be controlled by prompt treatment and the animal saved for successful breeding.

B-K is scientifically correct for this work. Used as a douche for the uterus, it quickly brings the after-birth, dissolves the slimy albuminous matter, kills the germs, stops discharges and controls the infection. B-K does not cause straining, but is soothing and heals the tissues.

Send for "evidence" and free Bulletin No. 2 "Contagious Abortion." If your dealer does not have B-K send us his name.

When Writing Advertisers, Mention The Cultivator.

will be required to produce a pound of pork. This amount can be materially reduced by feeding a protein supplement such as tankage, skim milk, buttermilk, middlings, or alfalfa. When tankage is fed in the proportion of one to ten of barley, the amount of barley required (dry lot feeding) will not be far from four and one-half to five pounds.

The amount of barley required to keep a brood sow in thrifty condition can only be stated in very general terms as it will depend on her size, present condition, and individuality. In feeding the brood sow one should aim to keep her in good strong condition, but not too fat and the amount of feed fed should be governed by the feeder's judgment. If it appears that she is losing weight or becoming too fat the amount should be increased or cut down as the condition indicates.

It is not a good plan to feed barley to the exclusion of other feeds. It should be supplemented with tankage or other available protein feeds and on the average ranch it will be found a good practice to furnish the sows with good quality alfalfa hay. The hay should be fed in racks to prevent waste and it is surprising how much hay a brood sow will eat. If possible, the sow should be given access to pasture, thus affording an opportunity to exercise as well as to forage.

Some mature sows in strong condition will maintain their weight on two or three pounds of grain—others will eat up to eight or nine—or even more—pounds.

An effort should be made to have the sow in strong condition at farrowing time. After farrowing little feed should be given for the first 48 hours. She should, however, have access to clear water, and it is not a bad plan to give her a light feed of bran—fed in a slop. Bran has a cooling effect on the septum and is somewhat laxative. After farrowing the sow should be brought to her full feed gradually, and she should be given sufficient feed to keep her from getting thin. Here again the exact amount of feed required cannot be stated. The amount should be increased as the litter develops. The character of the feed given should be rather high in protein. Most successful breeders prefer to feed middlings or shorts and the consensus of opinion is that middlings and skim milk fed in the form of a slop is about the most satisfactory ration.

SANDERCOCK DEVELOPING HIGH CLASS BERKSHIRE HERD

Near Sacramento, where is located the Natomorio Rancho, there is being developed a most excellent herd of Berkshires.

The dominant factor in establishing any herd is, of course, the foundation, and W. F. Sandercock, the owner, evidently had this in mind and has placed at the head of his herd the national grand champion boar, Baron Duke 201st, an extremely well sided and hammed boar.

As running mates there is Rincon's Rival 2nd, grand champion at the 1917 Oregon state fair, and Winona Lee Champion 6th, a son of Laurel Champion, a boar who has largely shared in making Berkshire history in the West.

Among the matrons maintained on the ranch might be mentioned Princess Leader, the only living sow with a world's grand champion sire and dam. She is from the mating of Grand Leader 2nd and Riverby Princess. Two litter mates to the above sow are Riverby Princess 2nd and Riverby Princess 3rd. The latter is the dam of a litter of six that averaged 428 pounds at ten months of age.

Recent sales are two boars by Baron Duke 201st, one going to Thos. A. Lawson, Kern County, and one to W. O. Robertson, owner of the Chowchilla Ranch, Chowchilla. Another by Winona Lee Champion 6th went to Harold Gish, Hanford. The entire herd of 22 sows have been carefully mated with the three boars for early spring farrow.

A man named Stone and a man named Wood met on the street one day and began talking of current affairs. A pretty young lady, wearing clothes of the latest style, passed. Stone turned to Wood, and Wood turned to Stone, then both turned to rubber.—Boys' Life for February.

POULTRY

OUR SPECIALTY
GUARANTEED TRAP NESTED
S. C. WHITE LEGHORNS
It's our business to improve egg production for you. We have the stock planned for your success. We hatch our own eggs and sell chicks and eggs from our own hens only. We have 1500 chicks yet to sell for middle of March, otherwise we are all sold out. Hatchery eggs from our high record hens at $5.00 and $10.00 per 15. Write us for prices on second season hens and yearling cock birds for April first delivery. These males are all bred from 200-egg hens or better and by hatching from them in May and June you will get eggs next December. If you really want the best in Leghorns, let us hear from you. ENGLANDS EGG RANCH. The home of "ACTUALLY" trapnested S. C. White Leghorns every day in the year since 1912. Box B 337, Inglewood, California.

For Sale—Bean Tractor in best condition with new improvements. L. F. Raftery, Owensmouth, California.

COMMERCIAL VALUE OF BEAUTY

Continued from Page 163

from a purely practical standpoint, the drives and walks outlined have a value in use quite aside from the beauty of the scene. Every passerby considers the home place an expression of the taste and personality of the owner, for people judge us largely by our exterior appearance, not only our houses, but ourselves as well. How will you be classified or indexed? It costs but little to be published aright. Cheap, unkempt grounds subject the owner to prejudice on the part of the beholder; while neat, orderly, artistic exterior appointments are entered to his credit. Let our home surroundings reflect us truly. Let us have a home that nestles snugly into a shelter of trees and shrubs, with a heavier background upon which the home picture is spread. Let us have a personal note apparent. Do not strive to get something different from what others have; do not have such a thought in mind. But plant as you think it should be, based upon observation and sober study of the problem. There will be found plenty of place for individual taste and expression in the flowers you grow and how you dispose of them.

Now let us leave ourselves and all selfish thoughts behind. We must also plant for the enjoyment of others; of all others, for every passerby gets pleasure from a view of your grounds. At least he should do so. Not only of the general public, but of your neighbor must you be thinking as you garden, for we are joyful in the thought that we bring joy to others. He who beautifies the earth is a benefactor, even though he does so largely for his own pleasure. And then that splendid generous spirit of cooperation that makes for community strength! Every fine garden contributes to the value of all property in the community, contributes to the enjoyment of all in the community, whether resident or visitor. The world is made better and brighter, and all that tends toward that end has not only an esthetic value, but one easily measured from a sordid dollars and cents standpoint. From whatsoever angle we view it, it pays to beautify the home grounds.

GREATER STRENGTH
Fewer Spoonfuls
BIGGER SAVINGS

The value of baking powder is based on its *leavening strength.* You can't judge it by the size of the can—or by the *amount* you get for your money. You must estimate it by the amount of baking powder *used* in each baking and the *results* you get.

CALUMET

is the greatest value ever offered in Baking Powder—it has greater raising *"force"*—it *goes* further than most of the other brands. You use only a rounded or heaping teaspoonful where others call for two teaspoonfuls or more.

But Baking Powder is not all you'll save when using Calumet. You save baking *materials.* Calumet *never* fails. The last *level* teaspoonful is as powerful as the *first.* Calumet is perfectly manufactured—*keeps* perfectly—and is moderate in price.

You save when you buy it—You save when you use it

One trial will satisfy you of these facts—will demonstrate beyond doubt that "Calumet spells economy."

Your grocer sells it on a guarantee of money back if you are not pleased with results.

Calumet contains only such ingredients as have been approved officially by the U. S. Food Authorities.

THE COST OF LIVING

"I do not see why folks complain,"
Said Jorkins, "of the price of meat;
For fifty cents a pound you get
A sirloin steak that can't be beat.
For the same money you can buy
A lucious English mutton chop.
Why should you ask for more than that?"
Yes, Jorkins keeps a butcher shop.

"The cost of living ain't so high,"
Said Jobkins. "Why should folks find fault?
For half a dollar you can buy
A full three months' supply of salt.
Just think what people had to pay
Right after our great civil war!
I tell you, flour cost money then!"—
Yes, Jobkins keeps a grocery store.

But Jobkins went to buy some meat
And said that Jorkins was a skin;
And Jorkins, paying Jobkins' bill
Declared he had been taken in.
And when the coal man asked for pay,
They both set up a mighty shout;
And just as they were feeling worst,
The plumber came and cleaned them out.
—Somerville Journal.

TEENY'S INSPECTOR

(Continued from last week.)

Teeny's eyes were so blinded with tears that she narrowly missed stumbling over the wastebasket, as Mr. Wallace sped out of the office toward the bank. He soon returned with seven hundred dollars, considerably more than the shortage, — which he proceeded to put with the daily sales money for the day. "I told them Mr. Dillon was too ill to bother with the bank account, and I would use my own money," he explained. "Now we'll count those missing stamps as sold until they're found!" He tried to calm down to wait on a man at the stamp window.

When the customer had gone, the inspector said, kindly, "I assure you, Mr. Wallace and Miss Schmidt, this unfortunate affair will go no farther until the adjustment is made. Mr. Wallace's manly action in trying to shield the postmaster from annoyance, as well as the putting up of the cash until the stamps are produced,

THE VALENTINE

February 14, 1919

This is the message, love laden,
I send
Bird winged through space to
the heart of my friend:
Strength for each day howe'er
lonely and long
Be thine, enriched by the lilt of
a song.
—Helen M. Richardson.

will weigh heavily with the department."

The task of inspecting the rest of the office kept the man busy until after dark. He chatted pleasantly with Mr. Wallace and Teeny, and even tried to persuade the girl to go to her evening meal; but she was too much excited to want to eat. She was hunting every spare moment for the missing stamps, as was Mr. Wallace; neither of them could have eaten a bite. However, Teeny would have to go home at seven o'clock, or her mother would be down at the office to see why she was delayed. Mr. Wallace was determined to spend the night there unless he found what he was looking for.

"Fire! Fire! Fire!" rang the cry in the street, and the red glare of a burning building lighted up the dingy office. In another moment the fire engines went clanging by.

In spite of his troubles, Mr. Wallace ran to the front door; the inspector was not far behind him. The rear doors were locked, and since they stood in the front door, both men knew that no one could rob the office. As Teeny was following the men to the door, she ran into a chair and upset the inspector's satchel and all his belongings. She uttered a groan, and expected both men to run back to investigate the commotion; but the noise in the street drowned the noise she made, and with trembling hands she hurriedly put the things back into the satchel. As she did so, she saw something that made her gasp; but she restored the things quickly.

"Let me see," said the inspector, as he and Mr. Wallace came back from the door. "I'll get my report out on that seven o'clock train, I think. I'll go over to the hotel and make it out, and then come back to help you."

He leisurely pulled on his coat, and did not notice that Teeny had hurried out of the door. She came panting back with two men, who looked bewildered and amazed, and then she made an awkward dart toward the inspector. She grasped his satchel just as he was about to take it up, and ran to Mr. Wallace.

"Take it! Take it! Our stamps are in there!"

Mr. Wallace looked at Teeny in amazement, and the inspector angrily made a move to take the satchel away from his. "This is an outrage!" he said. "Is the girl crazy?"

The two men whom Teeny had hastily called from the group at the fire looked on in bewilderment; but when the inspector scuffled with the assistant in an attempt to recover the satchel, they grabbed his arms and held him fast.

"If the stamps ain't in there," drawled one of the men, "we won't hurt you. If you're honest, you won't object to showing what you have."

"I upset his sachel by accident," cried Teeny, "and I saw the stamps in there! They are in our own old register envelopes, Mr. Wallace."

"You're right, they are, Teeny!" cried Mr. Wallace, hastily examining the contents of the satchel while the inspector struggled and cursed. "I knew they were not stolen."

"But they were," said one of the men, and he held the stranger fast. "Go and get a couple of policemen at once. This fellow's pretty strong."

When the excitement was all over, and the telegraph wires had clicked off the story, and the government officials at Washington knew what had happened, Christina collapsed and came near fainting.

"Teeny, you're a heroine," said Mr. Wallace, warmly, "and I beg your pardon for ever being unkind to you. Yes, I was unkind. I thought you were awkward and troublesome, but—"

"Well, I am!" wailed Teeny. "I'll never learn anything! I'm awfully awkward."

"And a blessed, lucky thing it is for us all!" said Mr. Wallace, fervently. "If you hadn't upset that satchel, that scoundrel would have stolen our stamps and my money. I've no doubt he intended to leave for parts unknown on the night train. He is a smooth rascal, and there's no telling how many offices he's held up."

The fraudulent inspector proved to be a criminal who had stolen an inspector's commission, and who had cleverly altered it to suit his own purpose. After he was safely lodged in prison, and his methods were discovered, a number of postmasters and their assistants confessed that he had held them up for large or small amounts. He would drop into an office and find the money or the stamps short, and then would "allow" the postmaster to straighten up the matter and get a good report. Of course most of them were willing and anxious to put in several hundred dollars rather than to lose their positions or to have the matter become public property, and the bogus inspector had escaped for a long time. No doubt he would have permitted Mr. Wallace to make the stolen stamps good out of his own pocket, and the matter would have been hushed up, had not Teeny upset his satchel.

Mr. Dillon and Mr. Wallace suitably rewarded Christina, but Mr. Wallace did more than merely reward her with a gift. He issued an order to the carriers; and ever thereafter the general delivery clerk was known no longer as Teeny, but as Miss Christina or Miss Schmidt. He was so kind and patient with her blunders that she improved wonderfully. Then he persuaded his sister to take the young girl under her protecting wing, and Teeny blossomed out in pretty clothes in a most astonishing manner.

"Well, Christina, your inspector will not try to defraud any more postmasters at present," said Mr. Dillon, the day the judge sent Charles Silver, alias James Greshom, to prison for a long term. "You did a good piece of work the day that you caught that thief, and I'm proud of you; but somehow I don't believe you'll ever do it again. You are always so careful and

quiet about your work now, Christina."

"I never want to do it again," said Christina, modestly, glancing down at her becoming dress and trim shoes. "One inspector is enough for me to catch in a lifetime—and I'll never upset any more satchels if I can help it, though I'm not sorry I upset that one."

"BIG SISTER"

Written for California Cultivator
By Mary Olmsted Lotspeich

The readers of the Cultivator are to be congratulated on the class of stories in the Household Department, as they are always practical and helpful, as well as interesting.

The one in a recent issue, which painted such a pleasing picture of the patient little knitter who was helped to do better work by sitting close to grandma, must have revived old memories for others as well as for me, of the daily "stents" which were required to teach us the use of the needle, in childhood days.

How interminably long the seams were in the sheets of those days, which must be sewed "over and over" with such care to have each stitch set so it should leave the proper slant, and how much shorter they appeared when divided by the tactful mother into sections of Europe, Asia, Africa and America, with stories told of each country as we journeyed through it with needle and thread. What delight to reach our own dear America, and the end of our task at the same time! Another time we would play the game of starting our work on the top step of the stairs, descending a few steps at a time as our work progressed. The dear mother had not forgotten when she was our grandmother's little girl and knew that "all work and no play" made Jacks and Jills dull boys and girls.

Then there were the days when the stock of trade of her school of needle work was a pile of patches and a pair of shears while she so carefully showed us how true to the pattern each piece must be cut and the light and dark pieces skillfully blended, if the blocks were to be perfect when pieced together. Patience and perfection were taught as well as the art of quilt making.

Though those days are far in the past, we are still "only children of a larger growth" and continue to have our "stents" to do; war work which took our time, taxed our nerves and tugged at our heartstrings, as we knit socks and sweaters, and prepared surgical dressings for our brave soldier boys. We have graduated now from knitting, and are once more busy with patch-work pieces for quilts, to go to make the people of the war-torn countries more comfortable, carrying warmth, we hope, for not only their wasted bodies, but their aching hearts as well, as they realize, by our deeds, that we, their more fortunate sisters, in this protected country are in spirit "sitting close by them," trying to help them over their rough places, and make their hard lives more livable, by giving them our cheerful service and heartfelt sympathy.

CHARD SOUP

Chard is a most versatile vegetable, for at least is capable of great versatility if the cook keeps her eyes open. The leaves are delicious greens; the stalks are better creamed like asparagus or salsify. But both leaf and stem enter the soup pot.

Last night for a quick supper I gathered a half dozen chard leaves, a handful of parsley and anotner of onion tops, put all through the food chopper and dropped in the soup pot in two tablespoons of hot fat, placed cover on pot and let steam for 10 minutes, then added boiling water a little at a time as needed. In 20 minutes the leaves were thoroughly cooked, salt and pepper were added and a thickening of a heaping tablespoon of flour and milk. Then I put in all the milk I happened to have, finishing out with boiling water and a little sour cream (sour cream adds a delicious flavor to all cream soups.

A loaf of French bread was crisped in the oven and served hot with plenty of fresh butter with the soup—and the rest of the supper was slightingly created by the whole family.

The house of every one is to him as his castle and fortress, as well for his defense against injury and violence, as for his repose.—Sir Edward Coke.

FRIED BRAINS

Do you know how delicious fried brains are? Better than oysters any day. Don't let this conjure up images of a melancholy scramble of eggs and brains—which is the usual way of serving them—good enough to taste, but not beautiful. A nurse taught me this way:

Clean the brains under running water, pulling the covering tissue off with the fingers, washing out blood clots. Drop in boiling salted water—a little vinegar or lemon juice added helps to hold the brains in shape. Let boil for 20 minutes. Drain and cool, divide in halves, roll in salted and peppered cracker crumbs, brown in medium hot butter or drippings.

Brains, by the way, are still reasonable in price.

THE HOUSEWIFE'S SPRING DRIVE

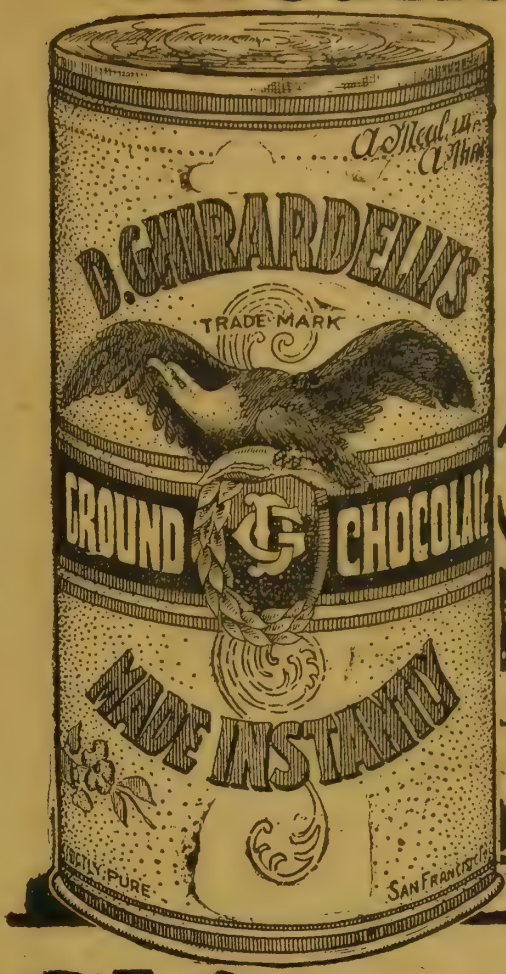
The advent of spring, bringing as it does a marvelous change in the appearance of the earth, serves as an incentive for people to brighten up their properties. The housewives conduct their mystic operation known as housecleaning, when the premises are swept from the topmost cranny of the attic to the lower regions of the cellar. All dirt is given the "Not Welcome" sign and forced to vacate and as a result at the end of a week's cleaning the house is in a spick and span shape.

Some of the more progressive housekeepers have made the cleanup complete by inspecting each article of furniture in the house in order to see if any attention is needed. Missing screws are replaced, nails are tightened up and the furniture is restained and reupholstered, and various other methods are used to give the furniture a brand new appearance.

Instead of using a chair or table in a scarred condition, Madame Housewife now takes a can of ready mixed varnish or stain, of a type of finish to suit the grain of the wood and her fancy, and in a few minutes she has a brand new chair. If the radiator or lamp fixtures are getting tarnished, an application of gold lacquer or aluminum paint changes the dull appearance to an attractive tint. Should the leather furniture have lost its original luster, a coat of leather renovator will make the leather look like new. Or should it be badly worn it can be upholstered with leather substitute at a great saving over leather.

The home which has been visited by this magician with his paint, enamels and cleansers will show a fresh attractive appearance that will reflect in the dispositions of the members of the family and will serve to make everybody more tidy and careful about their personal appearance. All of these cleanup articles are now made in such a shape as to be easily applied and their use is becoming more universal each year during the spring drive on dirt.

ABRAHAM LINCOLN



Born February 12, 1809

Oh, slow to smite and swift to spare,
Gentle and merciful and just!
Who, in the fear of God, didst bear
The sword of power, a nation's trust!

LINCOLN'S USE OF SIMPLE LANGUAGE

I remember how when a mere child I used to get irritated when anybody talked to me in a way I could not understand. I can remember going to my little bedroom after hearing the neighbors talk of an evening with my father and spending no small part of the night walking up and down and trying to make out what was the exact meaning of some of their (to me) dark sayings. I could not sleep, although I tried to, when I got on such a hunt for an idea until I had caught it, and when I thought I had got it I was not satisfied until I had repeated it over and over until I had put it in language plain enough, as I thought, for any boy I knew to comprehend. This was a kind of passion with me, and it has stuck by me, for I am never easy now when I am handling a thought till I have bounded it north and bounded it south and bounded it east and bounded it west.—Abraham Lincoln.

-in cans only

Ghirardelli's Ground Chocolate is so good—so pure—and so rich in nutriment that it deserves nothing less than this quality-sealed can. That's why Ghirardelli's is not sold in bulk, but *in cans only*.

In ½ lb., 1 lb. and 3 lb. cans—at the store where you do your trading.

POULTRY

Hens: heavy, 30@32; light, 30; colored, 32; broilers, 40@43; fryers, 35; roasters, 30; old cocks, 20.

Ducks, 30; ducklings, 33; geese, 28; turkeys, 34@35; squabs, 40-48; Belgian hares, 20.

LIVESTOCK

The market for live steers of good quality is firm. An undertone of weakness prevails in the market for medium and common grades. Good cows hold strong and other grades rule firm. The demand for cows exceeds the supply.

Hogs have been in liberal supply and the outlet for the dressed product decreased, which has resulted in a weak market for them. Only the top quality hogs command the agreed to price of $16.50 f. o. b. packer's yards. Light, extra heavy and rough hogs are fully a dollar lower.

Lamb receipts also have been liberal but the quality is only fair. Good quality handy-weights only are able to reach top prices quoted. Sheep demand is very light and the market for all but good wethers is very weak.

Following are the live stock prices Tuesday, February 4 in Los Angeles, f. o. b., packers' yards. Prices at country points are $1.00 to $1.50 per hundred weight less than those quoted:

Good steers, 13.50@14.00; medium steers, 11.00@12.00; common steers, 9.00@10.00.

Good cows, 10.50@11.50; medium cows, 8.50@9.50; common cows, 6.50@7.50.

Hogs — No. 1, 175 to 225 lbs., 16.00@16.50; No. 2, 250 to 350 lbs., 14.50@15.00.

Lambs, 65 to 80 lbs., 15.00@16.00; wethers, 11.00@12.00; ewes, 8.50@9.00.

Nine cars of live stock were loaded February 3.

POTATOES

Wholesale selling prices:

Supplies heavy. Demand and movement draggy. Stockton, Burbanks, quality and condition good. Sacked per 100 pounds, fancy 2.35; choice 2.00@2.15; Idaho Russets, quality and condition fair 2.10@2.20; Oregon, seed stock, White Rose and Red Rose, sacked per 100 pounds 2.75@3.00. Homegrowns, White Rose, mostly 2.75@3.00; few fancy, 3.25. Sweets, lug, 85@95.

ONIONS

Wholesale selling price, cwt.

Demand and movement moderate, little change in prices. Stockton, sacked per 100 pounds; Browns, best 2.25; White Globes, 8.00@9.00; Lompocs, Browns, 2.25@2.50.

VEGETABLES

These are the actual prices obtained February 4 by Los Angeles wholesalers in their sales to retailers, peddlers, hotels, restaurants, cafeterias, etc. Terms: Cash on the walk.

Easy—cheap—and safe to use! Write today for prices and interesting literature which explains how Carbon Bisulphide, for over 30 years, has been a safeguard of healthy crops and sound profits. Write now!

WHEELER, REYNOLDS & STAUFFER
626 California Street San Francisco, Cal.

with CARBON BISULPHIDE

Receipts past week 1054 tons. Very few dealers appear on the market in the mornings and there is practically no trading. Most arrivals are handled in the jobbing trade by those to whom they are consigned and consist mostly of their own holdings. Prices are not satisfactory to holders of hay and the predictions of an abnormally early spring and consequent feed shortage are causing owners to hold for possible higher figures later on. Cold weather and biting north winds have had a bad effect throughout Central California during the week, but reports of showers in the south and a possibility of their extending up to this city are more encouraging.

We quote today wholesale prices in carload lots as appear from dealers' transfers upon the hay market — for prices to consumers charges of cartage, commission and handling expenses must be added according to conditions:

Fancy Wheat Hay (light 5-wire bale)	24.00@26.00
No. 1 Wheat or Wheat and Oat hay	22.00@24.00
No. 2 Wheat or Wheat and Oat hay	16.00@20.00
Choice Tame Oat Hay	21.00@23.50
Other Tame Oat hay	16.00@19.00
Wild Oat Hay	16.00@18.00
Barley Hay	16.00@18.00
Alfalfa	16.00@19.00
Stock hay (in order)	14.00@17.00
No. 1 Barley straw, bale	50@80
Damaged hay (all kinds), according to condition.	

THE BEAN SITUATION

The United States bureau of markets reports under date of February 4, 1919.

It is evident that large stocks remain unsold, both of the 1917-18 crop and the crop of the present season. Unofficial estimates have placed stock in California alone at four million hundredweight, or 6000 to 7000 cars, available for shipment. The stock unaccounted for as carlot shipments is extremely large from each of the two last crops. Only 4556 cars from a crop of 16,045 cars (estimated 1000 bushels to a car) were shipped in 1917-18, or not much more than a quarter of the estimated yield for that season, and so far this season the proportion of carlot shipments to estimated yield is not much larger than for the early part of the preceding season. From an estimated crop of 17,733 cars, shipments to January 1, 1919, have been 2753 cars, compared with 970 for the corresponding period last season. The shipments during January, 1919 averaged about 140 cars per week.

Citrus Fruit Market

Los Angeles, Cal., Feb. 5, 1919.

Navels are holding up well, selling between $4.00 and $5.00, though there are some very low sales. This for injured stock. Reports from Eastern markets indicate that Florida Brights are selling around $3.40 to $4.40 in leading markets. Florida shipments at this moment are very light.

Lemon market not specially strong and a few shipments going forward.

Shipments

Shipments of citrus fruits to date since November 1, 1918: Southern California; oranges 4960 cars, lemons 1707, total 6667. To same date last season; oranges 3290, lemons 770, total 4060. Central California this season; oranges 2920, lemons 318, total 3238. Last season to same date; oranges 1875, lemons 98, total 1973. Northern California; oranges 244, 1 lemon. Last year same date, 202.

AT THE AUCTIONS

January 29

New York: 12 oranges, 1 lem. Higher. Nav. 4.10-5.15, Seed. 3.90-4.05, lem. 3.65-3.85.

Pittsburg: 5 oranges. Nav. 2.90-4.25, Bloods 2.80-3.20.

Boston: 6 oranges, 1 lem. Nav. 2.95-3.75, lem. 4.05-4.70.

St. Louis: 5 oranges, 1 lem. Nav. 3.85-3.86, Sweets 2.95-3.00, lem. 3.55-4.20.

January 30

New York: 13 oranges, 1 lem. Nav. 4.70-5.15, lem 5.10-5.45.

Boston: 6 oranges, 1 lem. Nav. 3.50-4.70, lem. 3.50-4.35.

Pittsburg: 2 oranges, 1 lem. Nav. 3.30-4.85, lem. 3.30-4.55.

Philadelphia: 4 oranges, 1 lem. Nav 4.80-4.60, lem. 3.90-4.90.

February 4

New York: 17 oranges, 4 lem. Nav. 4.20-4.90, Seeds. 2.80, lem. 4.10-5.05, Tangerine halves, 3.45, Blood halves, 1.95.

Boston: 6 oranges, 1 lem. Nav. 3.50-4.30, lem. 4.35-4.65.

Philadelphia: 4 oranges, 1 lem. Nav. 3.95-3.75, lem. 3.05-4.05.

PARTIAL LIST CALIFORNIA FRUIT AND VEGETABLE SHIPMENTS

From post card reports to the Los Angeles branch of the bureau of markets, report is made of the following shipment of cars of products from California for the week ending February 3: Apples, 31; artichokes, 3; cabbage, 33; carrots, 2; cauliflower, 134; celery, 35; dried apples, 1; dried apricots, 5; dry beans, 71; dried nectarines, 2; dried olives, 2; dried peaches 6; dried peppers, 3; dried potatoes 3; dried prunes, 32; lettuce, 42; mixed vegetables, 7; mixed fruit and vegetables, 34; mixed dried fruit, 6; onions, 32; peas, 1; potatoes, 217; raisins, 158; spinach, 14; sweet potatoes, 4; Arizona potatoes, 2; Nevada potatoes, 40; Mexican tomatoes, 7.

MARKET NOTES

The greatest interest this week is in beans, or perhaps more truly, the greatest lack of interest is in beans. Market is flat and dull. Prices are being shaded and the enormous holding is indicated by the "box" featured below.

Tangerines are quoted in Los Angeles at four to five cents per pound.

New York state grown Baldwins are selling in New York market $7.00 to $7.50 per barrel.

Latest wires from Chicago chronicle most enormous receipts of both hogs and steers. Notwithstanding the large numbers all beef prices are holding remarkably firm and even a very slight advance is indicated. Hogs are weakening. The price agreed for February still stands, only fanciest stock being received. The killers invariably demand that undergrade stuff be "cut out" or if accepted, at a material reduction.

One day's imports of Japanese beans at Seattle, Washington, 270 tons.

Large imports of beans are being made into New York from the West Indies.

California Golden Heart celery is ranging around 85c to $1.00 per dozen bunches f. o. b. producers' shipping point, or $7.50 per crate in consuming market.

The bureau of markets is doing some remarkably fine work in reporting stocks on hand and on general conditions. California producers are learning the value of this service.

Pony crates of cauliflower are now ranging around $1.25-1.30 So. Cal. shipping points. Price prevailing in Eastern markets is around $2.25-2.75 though some sales are made as low as $2.00 in the Middle West.

California Golden Heart celery is ranging in Eastern markets around $9.00-11.50 per crate. During the last week Baltimore has proved one of the best markets, showing an advance of over $1.00 and some sales being made as high as $13.50.

New York grown cabbage is now selling in terminal markets around $22 to $33 per ton. Florida early stock is coming in to Eastern market and commanding at shipping point around $1.25-1.75 per one and one-half bushel hamper. Florida shipments are lower than former years.

Texas grown spinach going into Northern markets ranging around $1.00-1.25 per bushel, though in Cincinnati during the last week at least $1.75.

Oregon grown Newtowns are selling in Los Angeles market extra fancy mediums, $2.50; same grade Spitzenburgs, $3.00-3.25; California Bells, $2.00-2.25; Oak Glenn Delicious, extra fancy large,

PEACHES IN THE SOUTH

Continued from Page 168

would care for if enough could be had. Following the Lovell, in order of quality, comes Muir, Crawford, and Foster. Few others of any sort are handled.

I asked Mr. Kitterman where his peaches came from, and he replied: "We bought over 2000 tons in the San Joaquin Valley." Asked how many they bought south of the Tehachapi; he replied: "None." It will be seen from this that the peaches must be good shippers, to be transported so far. In fact the superintendent so stated in speaking of the Lovell: "It is a fine shipper."

The San Joaquin Valley is far removed from coastal influences. So is Newcastle and all that grand peach section. While much of the former peach growing is on level land, the finest I have seen were grown on sloping land, though not so steep or of such elevation as the Placer County district. We have tens of thousands of acres of inland foothill lands suitable for peaches, lands in sections too cold for oranges.

We should plant more of the sorts most in demand and every planter should try some new varieties so that it may be definitely determined what sorts are best for the several districts as well as the best for each kind of soil. There is no good reason why local canneries should be forced to go far north to get good peaches in sufficient quantities to meet their full needs. While all of California needs more peaches, the south end of the state stands in greatest need. Now is the time to plant.

26TH ANNUAL

The Aggeler & Musser Seed Company of Los Angeles is issuing its 26th annual catalogue. It has illustrations of the big wholesale plant at Sixth and Alameda; also of the retail store at 620 South Spring Street, Los Angeles. Amongst other illustrations are a great many real garden scenes, illustrations showing seed bed construction, vegetable seeds, ornamentals and even garden implements. It is a valuable publication and may be had for the asking.

WEATHER CONDITIONS

MOHAWK VS - MUD

Your tires must fight the roads they travel. That's their job.

On most country roads, over gravel, macadam, rocks, ruts—the fight is hard.

On some roads, city asphalt for example, the fight is comparatively easy. High mileage records under easy conditions mean little or nothing.

We don't know where Mohawk tires will be used. We believe Mohawk users want a tire that will stand up and give a high mileage on *any* road. We believe they wish to go where they want to regardless of road conditions.

So from the beginning we have designed and built Mohawk tires not for easy work but for *any* work. We have built them with a tread so tough they will stand the abrasive action of macadam, cement, gravel and the cutting action of sharp rocks, fresh crushed stone, car tracks—with extra heavy fabric and an extra ply in most sizes to guard against fabric breaks caused by the hammering over rocks, cobbles, road holes and curbs—and with treads that hold secure against skidding, drive slipping or mud, snow, sand and wet pavements.

Where mud is prevalent we particularly advise the use of the Mohawk Non-Skid Tread.

The best proof that Mohawks do stand up under any and all road conditions is the fact our records show that 85% of all Mohawk buyers become permanent Mohawk users. [A "fair weather," "good road" tire could never show such a record.

We have accomplished these results by the simple, logical method of using only the finest grades of rubber and fabric produced in the world—by using generous quantities of them—by avoiding all dangerous cheap compounds and substitutes—by financing and conducting our business economically and efficiently.

Isn't it reasonable to believe that such methods must produce a tire much above the ordinary?

Isn't this the sort of a tire you want.

You will find good dealers almost everywhere who sell them.

THE MOHAWK RUBBER COMPANY
AKRON, OHIO

Chicago Atlanta San Francisco Boston New York Kansas City

MOHAWK "Qualify" TIRES

Mohawk Tires hold unusually well in mud. But there are altogether too many of these mud roads in our country—practically impassable winter and summer.

Do you know that less than 10 per cent of the 2,333,117 miles of public roads in the United States is improved?

Get behind the good roads movement in your county. It will pay you.

Hatch Early

Written for California Cultivator By Jean A. Koethen

WHEN this number of the Cultivator reaches its readers I trust it will not enter one single home where the hatching of the spring brood of chicks is not already under way. If only a single clutch of eggs is to be set it is just as imperative that they be set early as if the number were hundreds.

In California February is the best month in the year for getting out chicks. These early chicks for some reason seem hardier than the later chicks. They grow faster. They mind cold, rainy weather less. They eat with a better appetite. They are less likely to be the prey of mites and lice. It is a common experience that the first brood or so hatched in the spring always come along more satisfactorily than the later chicks, even those hatched in April. A government bulletin which was sent out this winter says: "Given the same feed, care and attention, chickens hatched the first of March will weigh more when they are four months old than those hatched the first of May when they are four months old. The rate of growth of a chick is greater during the first four weeks of its life than at any other period. Therefore, other conditions being equal, the more favorable the period the greater will be the rate of growth during that period. Consequently, the early hatched chick, having the advantage of a more favorable growing season, makes greater gains during the first four weeks of its life than the chick that is hatched later in the spring."

February, March and April, this bulletin says, are the best months for hatching in the northern states, while January, February and March are the best months for hatching in the southern and southwestern states. The February chick comes into existence with an enthusiasm for living which the April chick lacks. The days are cooler, the ground more or less covered with green. It may be, too, that the parent stock is a little more vigorous in January and February than later. The eggs are just as strongly fertile in the later spring months, but the mothers have felt the downward pull of the first warm days, together with the strain of heavy laying, and the chick has a little less vitality than the earlier chick. This is merely an idea of my own. I have no authority other than my own observation and experience, but I have so often noticed the greater eagerness for living in the early hatched chick that I must believe it not only comes out of the shell at a more auspicious time, but that it has a little greater constitutional vigor than the later chick. This might not be true east or north, but why should we not believe that spring fever affects fowls as well as human beings?

It does not matter whether we hatch our own chicks or buy them ready hatched. The principle is the same. Get them started as early as possible. Leghorns hatched in April ought to lay in October, yet most commercial poultrymen prefer to hatch for their own use in January and February. If they hatch in April they do it to supply procrastinators who do not know how much better in every way an early pullet is. These February hatched Leghorns often begin laying in July and August. Sometimes, if the weather is hot, they stop laying in October and go into the molt along with the yearling hens. Even if they do this, they have laid a good many eggs at a time when prices are high, but there is an even chance that they will not molt.

The secret of keeping early hatched pullets from stopping to molt in the fall, some experts believe, lies in full and careful feeding. The pullets can be kept laying, though they do go through a light molt, if they are fed all they can be induced to eat. One successful feeder gives his pullets at night a moist mash mixed with buttermilk. They have already had their evening meal of grain. In addition to this, just before they go to roost the mash is set before them and they are encouraged to fill their crops as full as they can be stuffed. A pullet that declined this stuffing would probably be put into the discard as one from which very little was to be expected. This man says he keeps his pullets laying right through the fall by this method.

Hens of the heavier breeds must be hatched earlier than Leghorns if they are to begin laying as soon. I am not sure that there is any great advantage in having a Red or Rock or Orpington lay in July or August, but it is certainly imperative that she begin laying in October if she is to be a profitable producer. Six months is the very least period that can be allowed any of these heavy breeds, and most of them will not lay inside of seven. When I kept Buff Orpingtons I found I could depend on their laying by or before the age of seven months. Many begin at five months, and the majority at six. Rhode Island Reds are a little slower. They may lay at six months, and they may hold on till eight. Much depends on the feeding. Light Brahmas are likely to defer laying till nine or ten months, and the Cornish, I am told, do not lay much before a year. All the American breeds, Rocks, Reds and Wyandottes, may be counted to begin laying by eight months, and many lay considerably earlier.

Keeping these facts in mind, it is evident that pullets of the American breeds must be out of the shell in February if they are to lay in October, and that Asiatics must pip the shell still earlier if fall production is expected.

When I talk early hatching to my neighbors they always agree to all I say, but end up with the protest: "How can we hatch early if we have no broodies?" How, indeed? There is more than one way of killing a cat, and hatching with one's own hens is only one of several ways of securing early chicks. For example, sometimes a broody may be bought. I advertised for one last week in the local paper, and before night of the day the paper came out I had the hen. She cost me $1.25, but I called that cheap when I weighed it in the balance with the possibility of having no February chicks. She is a gentle, motherly old biddy, and after she has raised her brood she will be worth nearly or quite all I paid for her just for the

THE POULTRYMAN'S CALENDAR

February, the Hatching Month.

Get out every chick you can this month. Hatch, hatch, hatch.

If you are buying day-old chicks, have a good brooder ready for them several days before you expect the chicks, and start the lamp or the heater at least two days before. Economizing on heat is no economy.

Keep up the war on mites. Nothing kills young chicks so quickly or so surely. Spray, paint, hose. There are plenty of good insecticides. The only lack is elbow grease.

Be sure, while you are hatching, that you hatch the sort of chick you will wish you had next November. Hens that lay are the only kind that pay.

Do not try to hatch chicks of more than one breed. It spoils the looks of your flock. If the breed you have is not satisfactory, now is the time to change.

Follow the directions in your incubator book minutely. Tend the lamps daily at the same hour every day. Turn the eggs regularly. Test out infertiles the seventh and fourteenth days.

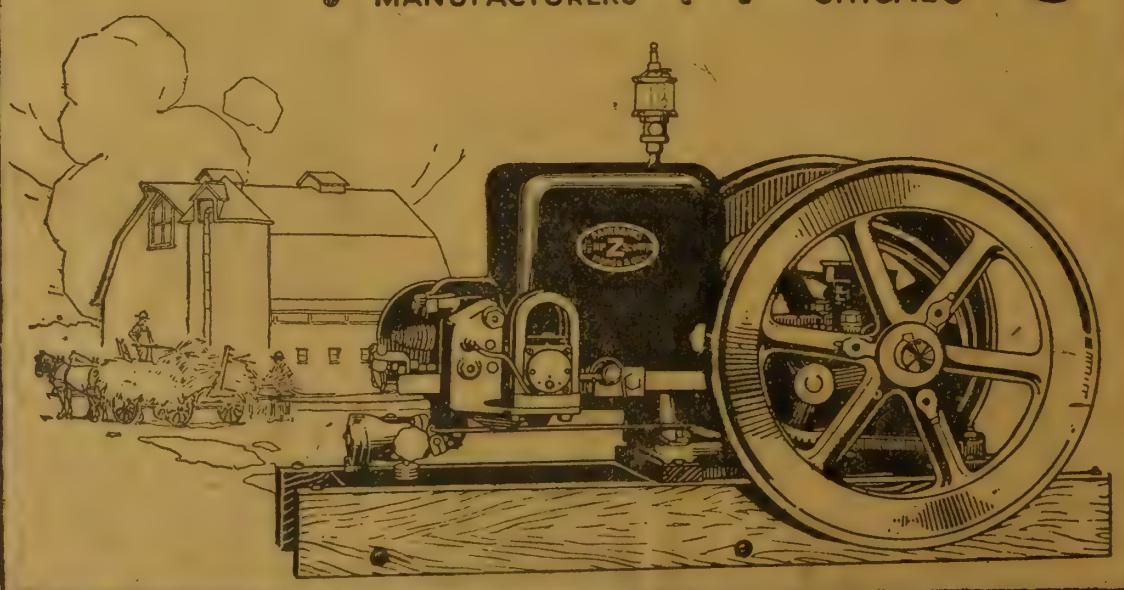
See that the siting hen gets off every day and that grain and fresh water are always within her reach. If eggs are broken, wash the soiled ones.

An Important Engine Announcement

IN announcing to the farmers of America our new 1½ H.P. "Z"—which successfully uses

KEROSENE

—we complete a *line* of kerosene engines—1½ H.P. to 15 H.P.—which merits the most critical investigation. When over 200,000 farmers back their judgment by buying over fifteen million dollars worth of engines—bearing this name plate—it quite firmly establishes the one answer for all farm engine needs.



There's a "Z" engine dealer near you—have him tell you why he adds his name to ours in backing the "Z" after comparing it with all others.

Throttling Governor—Built-in Oscillating Magneto.

Prices—1½ H.P. $61.00—3 H.P. $100.00 — 6 H.P. $179.00 — F.O.B. Factory

We Guarantee More Eggs

A good layer will transform one dollar's worth of food and supplies into $3 worth of eggs at present prices. To be a good layer a hen must be in top notch of health. That is GERMOZONE'S strong hold.

Germozone, three times a week, coupled with our simple directions for daily feeding, care and culling out slackers, is guaranteed to produce better and more permanent health and egg supply, or no pay.

One woman averaged 18 eggs daily from 21 hens in December. Germozone costs less than one cent per hen per month. See the profit.

Germozone cuts out the illnesses from musty or spoiled food, impurities picked up with food from floor, contagion through the drink, roup, colds, canker, throat inflammation, sour crop, etc. It goes well with any modern method of feeding—grain, vegetables, meat.

SIXTY DAYS' TRIAL—PAY IF SATISFIED. To those who agree to use as directed and pay if satisfied, we will send GERMOZONE first time on 60 days' trial, postpaid, without preliminary charge. Write today, stating how many hens you have. Germozone is sold by drug and seed stores in 75c and $1.50 sizes.

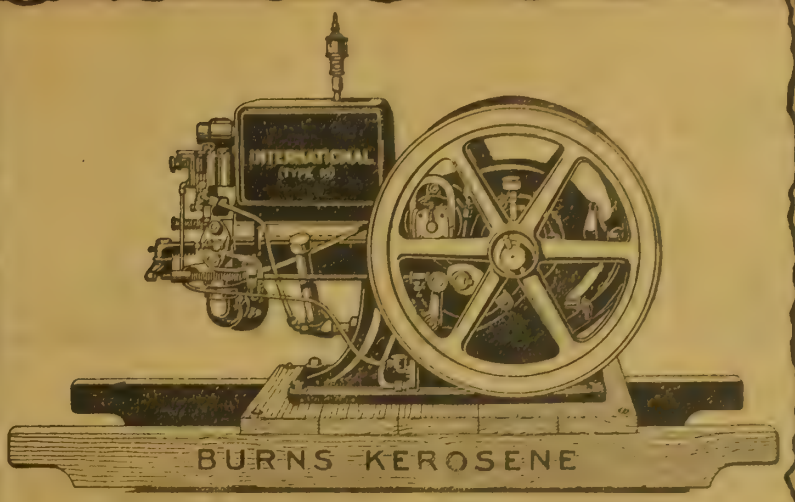
table. If I can find the chicks I want I shall buy a few to put with the brood she hatches. If she can raise 20 chicks, six or seven of which will surely be pullets, I shall have about all I want to raise this spring.

It is not the number of chicks you raise that counts, you know, but the sort of chicks they are, and the way they are raised, and the time when they begin to lay. I would rather have six pullets that began to lay in October and laid right along through the winter than 50 laggards that were not ready till January. To be sure of pullets that will lay in the fall, we must get them out in February or early in March and then keep them moving right along till they are fully matured.

But the sitting hen is not our only resource. There is the small incubator. If one has a good room to use it in it is a splendid thing to have a 60 to 100 egg machine just for getting out the early chicks. Personally, I prefer hens, because they are less trouble, but I have used the small incubators with great success and satisfaction, and many women and many more fanciers do use them and never set a hen. They even say the hen is more trouble than the incubator. Any one can learn to use an incubator, and it is one of the most fascinating of machines. A tray full of bobbing baby chicks, without any cross old hen to stretch her wings over them or to peck the hand that tries to cuddle them, is the most alluring picture imaginable—with one exception. That exception is a mother hen caring for her week old brood. She is the very essence of motherhood.

But why bother with hens or incubators at all when you can buy chicks in a hundred places? One can get Leghorns of almost any grade of excellence at hatcheries in every town throughout California. Other breeds are not quite so easily obtained but they can almost always be found by studying the ads., and you can buy them in season at almost any poultry supply house, to say nothing of the hatcheries. A neighbor of mine keeps no breeding stock. I do not know that she even has laying hens. She likes to have a chicken for the table coming along almost any time, so she goes to one of the hatcheries, buys 20 or 25 chicks at a time and raises them by hand—not in an expensive brooder, not even in a Philo fireless brooder, but just in a box with a hot water bottle to hover around at night. Farm women have raised chicks in this way since the beginning of time. A fireless brooder does very well if it is brought in at night or kept in a warm room or if the weather is not too cold. A box with a jug or jar of hot water and an old quilt or blanket for a cover is better, because chicks do like a little warmth. One of the regular outdoor or indoor brooders is better still. I have no desire to knock them. But the woman who has no hen and can not afford a brooder need not be deterred from raising a few chicks.

On the other hand, let no woman who has never raised chicks by hand try it till she has had lessons from an old hen. Brooding is no trick at all when you understand how the hen does it. It is the hardest thing in the world if you attempt it without having learned how. Better buy a good brooder than sacrifice tender chick life needlessly. Any one can follow written directions.



BLOOD TELLS

Gradually poultry breeding is becoming more like livestock breeding. It will not be many years until every buyer of a cockerel to be used in the breeding yard will insist on knowing the sire and dam of the cockerel before he buys the bird. The buyer will also want to know how many eggs were produced by the dam of the cockerel he is buying. Right now many buyers — some of them farmers, too—are demanding to know what's back of the birds they contemplate purchasing before laying down any money. The day of the scrub rooster in the farm flock has just about passed.

NECESSITY

"Are you willing to die for your country?"

"I'll have to be if the cost of living gets any higher."

THE PRESENT line of **International Engines** gives every farmer a chance to buy the very engine he needs at a price he can well afford to pay.

The sizes now run from 1 to 15-H. P., with a special line in the most popular sizes, known as the type M. All sizes, even the smallest, operate on common coal oil and other cheap fuels testing down to 39 degrees Baume. Every engine develops more than its rated horse power. All conform to International standards of quality, insuring good service, long life, and cheap operation.

It will pay any farmer who is in the market for a good engine, at a fair price, to pay close attention to the International line. If you can use a small engine, see the type M. It has a number of features which any engine-using farmer will appreciate.

The local dealer either has an International engine in stock, or he can get one for you. See him, or write us for complete information about engines or any others of the machines in the following list.

My K Hand Stump Puller

Gives Your Hand 96,000 Pounds of Power

Big stumps! stumps and trees with deep tap roots! any stump that can be pulled with the best inch steel cable!—you *alone* can pull with my "K" Hand Power Stump Puller—*without digging and without the expense of teams and powder.* I guarantee it. I refer you to U. S. Gov. officials. I give highest banking references. If you have stump land, the cheapest way of clearing it is with the

Frank Hance, a *one-armed* farmer of Bowie, Md., pulling a double silver maple 3 ft. 8 in. in diameter at the ground, with deep tap roots. This is an easy pull for the "K," as the cable can be hitched high and the leverage is consequently greater.

HAND POWER

Stump Puller

How the "K" Pulls Biggest Stumps

The "K" works on the leverage principle of the ordinary lifting jack, except that the power is applied on a cog-wheel instead of a standard. 100 lbs. push on the lever develops a 48-ton pull on the stump—all an inch steel cable will hold. One man operates it alone—no teams to pay for—no walking.

A Mechanical Wonder

Made of finest steel—guaranteed against breakage. Weighs only 171 lbs.—easily carried or hauled about on its own truck wheels. Has two speeds—60 feet per minute for hauling in cable or for small stumps—slow speed for heavy pulls. *Works equally well on hillsides and marshes where horses can not* work

Owners Praise It

H. Sinclair of the Dept. of the Interior, a U. S. Gov. official, writes: "The stump puller is a wonder."

Ernest Thompson Seton, author and naturalist, declares the "K" "a great success."

Hundreds of owners write in, telling of pulling six- and seven-foot stumps, of pulling faster and pulling bigger stumps than by any other machine.

Special Offer I am making a special offer to get a "K" Stump Puller introduced in every neighborhood. Write me today for full information and for free book on Land Clearing.

New Mitchell Sixes

Wheelbase 120 inches
Long-stroke Six motor
Cylinders 3¼ x 5
Tires 34 x 4

The New-Standard Six

Over 100 Betterments---50% Added Strength

The car we present now is a new model, built to new standards by new Mitchell specialists. It brings out for the first time all our new conceptions of how good a car should be.

War-time gave us our great opportunity. The great Mitchell factory was devoted to truck building. So our engineers and experts had 18 months to perfect this ideal Six.

They have added 50 per cent to the strength, 75 per cent to endurance, 25 per cent to economy and 20 per cent to beauty and comfort. Not in ten years has so great an advance been made at one step in this field.

Standards Too Low

Two years ago we concluded that all existing standards in Light Sixes were too low. The cars were too light. Most of them were too small. There was too much skimping to meet price competition.

Makers did not know requirements. What they called over-strength proved understrength too often. Hundreds of thousands of Light Sixes in use showed to us that standards needed raising.

Mitchell Sixes had been enormously successful. We were pioneers in Sixes. Our cars had won a world-wide reputation. Some had run over 200,000 miles. But we realized then that Mitchells also could and should be vastly bettered. And we resolved to do it, regardless of all rivals.

New Specialists

We added to the Mitchell staff many new specialists. Each was a man who had made his mark in high-grade car construction.

Then came the war, and we entered truck building. That gave these new men 18 months to design and perfect this new Mitchell.

They worked out more than 100 improvements. They spent over $250,000.00 on new equipment for better workmanship and accurate tests. They created a staff of 135 inspectors. Part by part they revised our standards, until they had added 50 per cent to the strength and 75 per cent to the endurance.

Some Major Changes

Your Mitchell dealer will show you countless improvements. But the best are shown only by tests. The gears, for instance, are made 25 per cent stronger. A new hardening process insures complete uniformity.

Rear axle strength is increased 50 per cent. Brake efficiency is increased 75 per cent. The steel frame is 1½ inches deeper, adding 50 per cent to the strength.

The steering gear is 10 per cent stronger, and it has two ball bearings. The crank shafts show a tensile strength of 150,000 pounds per square inch.

There's a new type of disc clutch. There are 123 drop forgings. Chrome-Vanadium and Chrome-Nickel steel are used in abundance.

But our long cantilever rear springs are unchanged. They could not be improved. They have made the Mitchell the most comfortable car in its class. And not a spring has broken out of 40,000 pairs.

Less Operating Cost

Gasoline and oil consumption are reduced 25 per cent. This partly comes through perfect-fitting cylinders. It largely comes through a thermostat which regulates the water system to maintain an even heat.

We use body frame material costing twice the usual to make the bodies staunch. We use interlaced hair in the upholstery, so it stays in place. We use four coats of varnish instead of the usual two, so the finish is enduring.

Our wheelbase is 120 inches to give ample room. Compare that with other five-passenger Sixes. We employ 135 inspectors and testers to insure that every part is right.

The Lowest Price

Still this new Mitchell, with all its improvements, undersells all rivals. It remains, as always, the lowest priced Six of its size and power and class.

This new car forms the supreme example of what factory efficiency means. We build the complete car, chassis and body, in a plant that is famed for its scientific methods. As a result, we continue to offer a value unapproached in this class.

Write us for further details. Then see this new car at your nearest Mitchell showroom. See for yourself what these new standards mean. You will fmd no other car this spring with so many new attractions.

Mitchell E-40

Price, $1,475, f. o. b. Racine

Embargo on Rice Restored

Discussing the rice situation, a writer in the Sacramento Bee says:

February 1.—Ernest Behr, chairman of the California rice committee, has returned from Washington, where he was sent by rice millers and growers of the state and announces that the problem of marketing California rice and its by-products has been solved.

After an explanation of the situation, the war trades board decided to restore the import bargo, entirely prohibiting the shipping to the United States of oriental rice. This embargo, effective January 25, will be left in force until the domestic crop is disposed of.

Another concession in favor of California growers was obtained by Behr from the Belgian relief commission, who agreed to lower the standard of rice shipped to Belgium from the Blue Rose type to Japan two parts and cracked rice one part.

In accordance with this decision an order for April rice for shipment to Belgium has been placed with California millers totaling 260,000 pockets of milled rice, or equivalent to 400,000 bags of paddy.

This shipment will practically exhaust the available supply of millable rice on the coast and since it will use up 80,000 pockets of cracked rice it largely solves the problem of the rice by-product market.

In order to take care of the screenings a cable was sent to Food Administrator Hoover, asking that the war regulation prohibiting grains in the manufacture of malt beverages be modified to permit the use of brewers' rice, or rice screenings, for the manufacture of near beer.

An immediate outlet for the local crop was provided by the chartering of a steamer which will sail for Porto Rico about February 10 with a cargo of 200,000 pockets of cleaned rice.

The action of the war trades board in restoring the embargo against foreign rice has met with disapproval on the part of importers and also of congress, which claimed usurpation of its power to regulate the tariff. However, this action was taken by the board only as a last resort to make possible the carrying out of the government's signed agreement with the rice growers.

Behr found a tendency on the part of several United States grain corporation officials to favor a canceling of all war time agreements and return to the unrestricted markets of prewar times. He opposed such a view by showing that the rice men, in voluntarily agreeing with the food administration to limitation of the price, had lost the opportunity they had for a better market at that time. It would therefore, he argued, be unfair to ask the growers to surrender their contracts with the food administration at a time when the market was poor and the price much lower.

The condition in which the Southern growers found themseves at the present time, Behr states, is very serious, as they have an equivaent of 3,500,000 100-pound bags of rice still unthreshed, much of which will be damaged so as to preclude its sale in the domestic market.

Cotton Planting

The recent meeting of San Joaquin Valley cotton growers at Fresno gave opportunity for a manifestation of much interest. It was a big meeting in number of attendants and in numbers of questions presented.

Most of the cotton planted in the San Joaquin was of the long staple, though some planted Durango. The favorite long staple was the Pima, or Arizona produced seed. It is urged that San Joaquin Valley producers center on long staple in order to produce a pure seed.

From report of the meeting in the Kerman News by A. R. Taylor we give the following points on San Joaquin Valley cultural practice:

Time of Planting

Experience shows that the cotton should be planted during the early part of April, using 20 to 30 pounds per acre and planting about two inches deep in a well prepared, moist seed bed.

Soil

Like most crops, only good soil should be planted to cotton. Strong alkali land or heavy land with water table close to surface will not give best results with cotton irrigation. A uniform moisture condition should be maintained during the first part of the growing period. Do not produce continual late growth by late irrigations.

Cost of Production

The only itemized figures showing cost were given by Mr. Frisselle of Kearney vineyard. These figures showed a total cost of $63 per acre from preparation of the seed bed to the hauling to the gin inclusive. Six hundred and sixty-six pounds of seed cotton were produced per acre.

Production

The production figures for the past year were mostly low due to late planting and inexperience of growers. Average production figures mean very little. Statements have been made at least unofficially by some of the government men that Pima long staple should return a net profit of $100 to $125 per acre.

The tarnish bug and squash bug caused about 14 per cent injury to the cotton this year.

In the Salt River Valley, the average yield of long staple this year is about one-half bale per acre.

Mr. Kaufman, of the bureau of statistics, stated that the average production of lint cotton in California for 1918 was 265 pounds; that 2500 acres of cotton were planted in the San Joaquin Valley and 1200 acres harvested. In Fresno County 300 acres were picked.

Durango cotton yields heavier than long staple, matures earlier, is easier to pick and so costs less per pound to pick.

Of the long staple, the Pima is considered the best strain. The long staple requires a longer growing period than Durango, yields less per acre, is more difficult and so costs more to pick, but is better quality and worth more per pound.

EUROPE LIKES AMERICAN MILK

European people have learned to like American dairy products. Exports of condensed milk to Europe rose from 16,000,000 pounds in 1914 to 530,000,000 pounds in 1918, and there were notable increases in exports of other dairy products. Much of this may be due to abnormal war demands, but the United States department of agriculture believes that there is both an opportunity and a tendency to expand in this direction over prewar requirements. A normal increase in dairying in this country, the department thinks, is fully justified, provided there is the necessary increase in feed crops.

RUNNING AN ENGINE

The United States department of agriculture has issued some practical hints on running gas engines in Farmers Bulletin 1013. There are only 16 pages in the bulletin, but it is packed full of suggestions to inexperienced runners of gas engines on avoidance and remedy of some common engine troubles. The last page is given up to a trouble chart which enables one to quickly locate and diagnose cause of "Loss of Power"; "Misfiring"; "Pounding"; "Backfiring"; "Explosions in Exhaust Pipe"; "Overheating"; "Irregular Speed"; "Smoke."

FEET THAT DIDN'T FIT THE STYLE

"These shoes are too narrow and too pointed," complained the stout man who was having trouble in being fitted.

"But," explained the salesman blandly, "you know they are wearing narrow, pointed shoes this season."

"That may be," said the stout one with dangerous calm, "but I am wearing my last season's feet."

"Good will among men is a prime necessity of reasonable living."—Arnold Bennett.

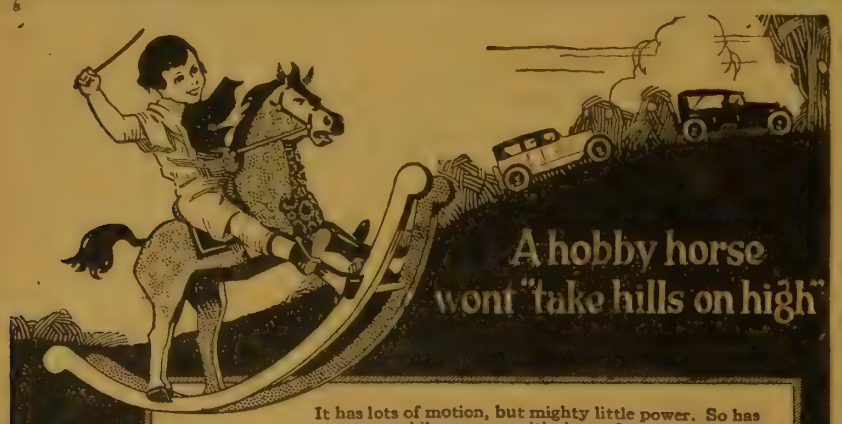
The success of a crop is often determined by the selection of a top dressing. When using a nitrogeneous fertilizer for this purpose, choose ARCADIAN Sulphate of Ammonia, because:

Having been dried and ground, it is dry and fine, so that it will drill or broadcast easily.

It is a definite chemical compound containing 25¼ per cent. ammonia, or 20¾ per cent. nitrogen.

The nitrogen is readily soluble and it is all quickly available. It does not leach out of the soil easily, and is ready for use when the feeding roots need it.

It does not deteriorate with storage. In chemical composition it is particularly suited to California soils.



Arcadian Sulphate of Ammonia

ARCADIAN Sulphate of Ammonia is the well-known standard article that has done you good service in your mixed fertilizers for years past. Especially kiln-dried and ground to make it fine and dry. Ammonia 25¼ per cent guaranteed. Made in U. S. A.

For sale by Hawaiian Fertilizer Co., Limited, San Francisco
Pacific Bone Coal & Fertilizing Co., San Francisco and Los Angeles

Uncle Sam---Agriculturist

By C. B. Messenger

WHEN one has had long association with any particular organization, and from a long distance, he is reasonably sure to have formed conclusions as to the location and general appearance of the visible things connected with it, which, when he comes in contact with them, are sure to be different.

What my impressions were as to the appearance of things in Washington, with especial reference to the department of agriculture, is of little moment, though I will refer to one impression, and that one was a picture of one great building housing all activities of the department of agriculture. Color was given to this picture by the knowledge that Former Secretary of Agriculture Wilson had a plan —which has been partially carried out —for one great agricultural building on the grounds of the department, something like two miles from the capitol building. But construction work on this building—which began many years ago—has been stopped, with its two separate wings completed and occupied, but with the great central dome, or principal feature architecturally, as yet visible only on the plans. The photos on this page give something of an idea of the present appearance of this great agricultural building. The best general impression, however, is given in the illustration on the cover page, which was taken from the top of Washington monument which stands within a few hundred rods of the grounds of the department of agriculture.

East Wing of New Building

The relation of these buildings to each other is best shown on the cover page, where, in the lower right hand corner of the engraving, one sees the two great white buildings, separated by several hundred feet, which are expected to be connected by a large domed structure. The original department of agriculture building is shown in the cover illustration directly in front of these two wings. This building is a dark red brick and not at all prominent in the engraving.

In this general view from the monument the original headquarters of the department is one of the nearest buildings, though not prominent at all because built of dark red brick. Immediately back of it are the two wings of the new agricultural building waiting for another appropriation by congress to give the funds for its completion. But other structures in different parts of the city of Washington, many of them business blocks, house a great number of the bureaus and divisions of the department. For example, farm management is in a little old four story structure on a business street. The weather bureau occupies an especially constructed building of its own, but still some distance from the old headquarters. The forest service and the bureau of chemistry are in other business blocks, while the bureau of markets and the biological survey occupy an eight story government structure across the street from one of the new wings of the main agricultural building.

Administration Offices of Department of Agriculture

Secretary Houston's offices occupy part of lower floor at the end of the building at reader's right. General offices and assistant secretaries offices occupy other lower floor rooms.

In seeking the center of department activities one is directed to "the head of 13th Street." There a large park with several glasshouses and many large specimens of native American trees afford a setting for the old agricultural building, decidedly out of date, but withal very comfortable and complete. Secretary of Agriculture Houston's office is at one end of this building, as are the offices of his assistants and clerks. The secretary's office is large, fitted with ordinary leather upholstered chairs, with a large mahogany desk in its center. It is large enough to accommodate a delegation of 60 or more people.

The central building—to be—for the department headquarters is partially completed, immediately to the rear of this old building. The wings, separated by several hundred feet, show the making of a wonderfully beautiful structure some time. We are not informed as to whether any immediate steps are to be taken to finish this structure—presumably not during reconstruction days.

The magnitude of the activities of the department are so apparent when one sees this great number of buildings occupied by the different specialists and clerical workers that the question automatically comes, "What is covered or—perhaps more correctly —what is not covered by the activities of the department?"

To gain this information I was sent to the chief of the division of publications, Mr. E. B. Reid, and I asked him if he would not make for California Cultivator readers a statement of the activities of the department, especially during the past few years of war time. Mr. Reid has complied with this request, and the statement which follows is merely an outline, for any account of the detailed work of the department would require volumes.

As one indication of the magnitude of the work we may call attention to the fact that during the past year congress, by the regular appropriation of the Smith-Lever act and special appropriations as a war measure, allowed for extension work, or, in other words, the work of the farm bureaus and county farm agents, the enormous sum of over $17,000,000. The Smith-Lever act allowed, after a period of several years from its enactment, to this extension work a maximum of $9,000,000 annually. The war appropriation ends, we believe, July 1, and congress is now considering as to whether the reconstruction period calls for a continuance of the special appropriation. This is a matter for concern on the part of those interested in the farm bureau movement, but presumably the appropriations will not be for some years as large as during the past year.

West Wing

The above illustration shows about one-third of the great building to-be when the dome is completed. This is also shown in the extreme lower right corner of engraving on cover. These two wings are filled with offices of the various bureaus and divisions of the department of agriculture. Almost exactly in the center of the engraving on the cover page, and rather indistinct, are the buildings of the Smithsonian Institute. The national capitol is plainly seen in the distance, nearly two miles from the Washington Monument from which the photograph was taken. The Congressional Library, also rather indistinct, is immediately beyond the capitol.

But as to the other activities of the department, here is the outline as given by

E. B. Reid

Uncle Sam, agriculturist, is busier than a shipbuilding plant during a naval emergency. He supervises the farming of 289,000,000 acres which stretch from Alaska to Hawaii, from the Golden Gate to the statue of Liberty, while he husbands the production of crops which feed not only 110,000,000 Americans but which now are the foundation of the rationing of the entire world.

The activities of Uncle Sam are visualized in the efforts of the department of agriculture and its force of 25,239 workers who are spreading broadcast the doctrines of better farming and improved agricultural practices. Be it weather conditions, animal contagion, plant disease, soil sickness, fertilizer problem, farm labor tie-up, marketing puzzle, woodland riddle, farm management enigma, highway controversy, or one of the thousand odd other mysteries of farming operations which arises, the United States department of agriculture is prepared and well qualified to give expert assistance. Daily through the service of 5218 county agents as well as its hundreds of expert field agents, the department is aiding farmers right out in the field and paving the

OUR ADVERTISERS RELIABLE

We guarantee our subscribers against loss through dishonesty of any advertisers in the Cultivator. We do not attempt, however, to adjust trifling differences between subscribers and honest, responsible advertisers, nor will we pay the debts of honest bankrupts. Notice of complaint must be sent us within 30 days from date of the transaction, and the subscriber must have mentioned the Cultivator when writing the advertiser.

THIS WEEK'S COVER

Washington is a beautiful city, but its magnificent distances and beautiful government buildings have been referred to so often that perhaps some of us are disappointed at our first look at the city. One thing at least which causes remark is the wonderful Pennsylvania Avenue leading from the national capitol to the White House. This is lined much of the way by shops which do not add to its appearance, but we give on the cover of this issue a beautiful view of this beautiful city, for, really, after one has visited its many parks and notable buildings its real charm is appreciated more than when traversing Pennsylvania Avenue. The illustration is from a photograph taken at the top of Washington Monument and is of interest to Cultivator readers because of the fact that this particular view brings into the immediate foreground the park in which are the greater number of the buildings housing the activities of the department of agriculture. As to these activities there is a fund of information in the article beginning on third page of this issue.

BOLSHEVIKI OUSTED

The citrus growers are giving short shrift to the I. W. W.'s and Bolshevik agitators who are endeavoring to frighten orange pickers who are willing to work at a wage less than four dollars per day of eight hours. Several of the agitators have been arrested and the incensed growers are now so thoroughly organized that the agitators are showing weakened nerve and it is hoped will soon quit the field.

CHIEF FARM MANAGEMENT

The department of agriculture announces the appointment of R. L. Adams, formerly of the University of California, as acting chief of the office of farm management. His services began January 1.

GLORIOUS RAIN

The state has been saved by another glorious rain; from Shasta to San Diego there has been a general wetting. The precipitation is not sufficient to give abundant crops without more, but there is still two months of the rainy season. If a fair average over a period of several years is equalled this year, we can then be assured of a wonderfully successful season.

INCOME TAX RETURNS

The revenue office has served notice that there will probably be no extension of time beyond March 15, by which date all returns or reports of each person's income must be in the hands of the tax collector. Unfortunately, the office is not ready yet to give out the blanks on which these returns may be made, but these evenings should be given up to completing one's bookkeeping for the year 1918 and having all the information ready for copying on the blanks once they may be had. This will not be until congress has finally agreed on all the terms of the new law.

PURE SEED LAW

The present session of the state legislature must certainly give to California a pure seed law. The state has long been the dumping ground of foul seeds, and it's time our legislators rendered that much of justice to the producers. The proposed law places its enforcement in the hands of the state horticultural commission and calls for the offering on the market of only seed reasonably free from weed pests and reasonably free from dead seeds. The situation this year as to supply and effective distribution is not favorable to the grower. Production has been small; American and European demand will be large. Unless California is prepared to protect herself the state will be liable to plant many seeds not wanted in other sections. California is taking the initiative in many progressive movements, but in the matter of a pure seed law she is resting altogether too easy.

BETTER ROADS

Secretary of the Interior Franklin K. Lane has said that: "You can judge the civilization of a nation, or of any part of a nation, by the character of its highways."

When we have taken a ride over some of California's glorious roads we feel reasonably secure in the judgment which would be passed upon the civilization of this state, but at the same time there are some roads in California yet which might induce severe criticism of our degree of civilization. Hence some of our biggest thinkers are making serious investigation as to road conditions. Conferences have been held, and more will be, and the 33 millions which already have been voted in bonds for good roads may be materially increased, or at least the opportunity to materially increase these bonds may be given to the voters of this state at a later election. Some optimistic believers in California's good roads suggest that the next bond issue shall be for at least $30,000,000.

WHEN EAST COMES WEST

There is a widely quoted bit of philosophy concerning the manufacture of mouse traps, that, in substance, is to the effect that the buying public will seek out the man or community producing in greatest perfection any one thing.

We attach considerable importance to the recent sale of a carload of registered Berkshires to a Pennsylvania buyer, for the reason that it demonstrates what can be accomplished along the line of live stock production in this state.

There was no sentimental reason why the Eastern buyer should come here. He came because California produces the best Berkshires. And if breeders of other classes of live stock will spread their sails they can be certain of attracting the highest class of buyers. Buyers go where the best is produced—it makes no great difference whether it is Maine or California.

Any state that can produce the variety, quality and abundance of feed that is possible in this state is bound to develop as a great breeding ground.

Some day the term "California bred" will have wide application and important significance.

STOP THE FIRES

An educational campaign has been conducted for years in the endeavor to induce people to use greatest care, when camping or traveling in the mountains of California, to prevent disastrous fires. The state forester and several of the national forest supervisors have made regulations most stringent and arrests have been made and heavy fines imposed for carelessness. The state forester is now asking for more power in the matter of fire control. He is urging the passage of Senate Bill 399, introduced by Senator Ingraham. This bill provides for such rules and regulations as may be necessary for the organization and maintenance, government and direction of a fire protective system. It provides for the establishing of fire districts, the appointment of a district fire ranger, the securing of proper fire prevention and fire fighting equipment, and the organization of volunteer companies.

Several counties of the state have made appropriations and provided fire fighting apparatus, but this has not been sufficient to properly protect even a small per cent of the fields and forests. This bill, if made a law, will give strength to this movement and save millions of dollars worth of valuable property.

Let us have Senate Bill 399 made into a law.

GROW BEANS

Now comes a letter from Tulare County regarding our comments on the bean situation. The writer suggests that it appears that Lima bean prospects for the coming year are not at all bright and asks as to the probability that other beans such as Pinks, Blackeyes, etc., will "enjoy" the same poor market. Beans is Beans and no one has any particular edge on another but we hasten to say that while we have been frankly discussing a very disagreeable situation amongst ourselves there is no occasion whatever for losing our interest or rather our hearts in the matter of going ahead and producing what the world wants.

There is a great quantity of beans on hand. Worse, there has been woeful mismanagement in the moving of these beans to market, and while this situation is not as yet corrected, there is a spirit manifested which will result in its correction. Beans are a staple food and will be as long as the world lasts. We confidently believe that before another season's crop is being threshed thousands will be eating California beans and asking for early delivery of the new crop. Everlastingly trying some new crop can only result in indifferent yield and disappointing financial returns. Every competent authority who has investigated the world food situation, the surplus and the probable production of the next 12 months, has insisted that if proper distribution of all the food which can be grown can be secured there will be call for every pound of food products.

MORE BEANS

Anton Serres, whose articles on the bean situation are creating no little interest, especially in view of the fact that the situation is "getting no better fast," writes, suggesting the publishing of a list of California's senators and representatives in order that producers may write them urging such steps as may give relief to those who answered the call of their country to produce more food, but who are not able now to get the food started on the way to the hungry people.

The representatives of California's 11 districts serving in the present congress are: 1,Clarence F. Lea; 2, John E. Raker; 3, Charles F. Curry; 4, Julius Kahn; 5, John I. Nolan; 6, John A. Elston; 7, Denver S. Church; 8, Everis A. Hayes; 9, Chas. H. Randall; 10, Henry Z. Osborne; 11, William Kettner. The senators now serving are: Hiram W. Johnson and James D. Phelan.

An advertising campaign to increase bean consumption is suggested by Mr. Norswing in a recent Cultivator, and the same procedure has also been suggested by Manager Churchill and others of the bean growers association. Beans make one of our best foods, yet are not fully appreciated by the people who would consume great quantities of them if they could see two or three colored illustrations of a right nice bean on the back cover page of some great Eastern magazine. Speaking of Eastern magazines, we are reminded that there are perhaps some California publications which may extend the gospel of the bean and encourage its greater consumption.

But above all, the biggest one feature of this bean situation is the lack of complete cooperation. Get every bean grower in the state into one powerful organization with an efficient manager, and advertising and a number of other things will be settled so quickly that beans will begin to move.

The greatest of world wars has been won by cooperative effort, and cooperative effort has been boosted during the past four years as never before in the world's history. Let the bean grower get wise. This cooperative organization can be made so strong that it can not only make thorough investigation of market conditions the world over, and carry on a great campaign of advertising, but in addition can devise means of putting its food in most attractive shape in order to increase sales. Whether the establishing of a cannery under control of the members is feasible or not we cannot say, but we may refer to the fact that the citrus fruit growers are now processing their own culls and low grade fruit and making highest grade products of them, securing fair return to the grower.

The possibilities of cooperation have not yet been half told.

Bean Situation---Mass Meeting at Oxnard

THE bean situation has cleared but little during the past week. Eight or a dozen cars are being shipped from California daily, while imports to Pacific Coast points are often as great as the entire outward shipment. During the week Manager Churchill of the California Lima Bean Growers Association has returned from a trip East with little encouragement for a betterment of the situation. He thinks the effort to have set aside for the purchase of beans a portion of the $100,000,000, appropriated by congress to feed starving Europe will not succeed. The understanding seems to be that this appropriation was made for the purpose of transferring to the food administration the great stores of army supplies now in France, and that but little, if any, of it will be used in purchasing food in America.

On Wednesday of last week bean growers gathered in mass meeting at Oxnard and passed the following resolutions:

"Whereas, the government of the United States, through its food administration and otherwise, prior and during the planting season of 1918, by every means possible repeatedly requested, urged and encouraged the bean growers of California to increase the bean acreage until every available acre should be utilized with the end in view of supplying as nearly as possible the abnormal demand for foodstuffs throughout the war devastated world, basing the request upon broad patriotic and humanitarian principles; and

"Whereas, the bean growers of California responded with such intelligent, painstaking labor and disregard for the expense of production that they succeeded in raising one of the largest crops of beans ever produced in this state, and

"Whereas, now that the crop has been successfully grown and harvested they feel that they are entitled to a just return for their labor and expense. But, to their dismay, they find that there is not only no market for their beans at a reasonable price but that beans which have been grown under more favorable economic conditions are being imported by hundreds of tons almost daily; and

"Whereas, there is still unmarketed in the state of California more than 60 per cent of the entire bean crop with no immediate prospect of disposing of the same or any substantial part thereof, and

"Whereas, the inability to dispose of their beans has made it impossible for many farmers to meet their obligations; therefore be it

"Resolved, that no matter how anxious and willing we are to do our part it will be almost impossible for us either as individuals or as a community to absorb our share of the forthcoming Victory bonds, unless relief comes soon; and

"Whereas, the congress of the United States has appropriated the sum of $100,000,000 to be expended in providing food for the famine stricken districts of Europe; and

"Whereas, beans constitute one of the most concentrated and staple foodstuffs that can be secured; now therefore be it

"Resolved, by the bean farmers of California now in this meeting assembled, that the government be urgently and earnestly impressed with the wisdom and justice of investing in beans, including Lima beans, not less than $20,000,000 of said $100,000,000, allotting 65 per cent of the amount so invested to California, inasmuch as that proportion of all the beans in the United States is now stored in this state; and be it further

"Resolved, that copies of this resolution be forwarded by the secretary of this meeting to our two United States senators and all of our representatives in congress as well as to the grain corporation of the United States food administration."

In addressing the mass meeting Manager Churchill said, as reported by the Oxnard Courier: "As nearly as I could learn while in the East, a considerable part of this $100,000,000 is to be turned over for food that is already in Europe, having been sent there by our government months ago when it was supposed that the war would continue some time. . . I think however that conditions are such that it would be well now to make some expenditure in advertising. Beans of every description are being consumed in less than normal quantities. Against that, more beans have been produced than in former years, owing to government request to farmers to produce the utmost amount of foodstuffs to assist in feeding the armies and the civilian population of our allies. . . . So it would seem to a certain extent that consumers have gotten away from using beans and advertising seems to be the best method to bring them before the public. I can announce that the Lima Bean Growers Association is willing to take its full pro rata part in any advertising campaign that should be stimulated. The association is now formulating plans to that effect for the coming season, but probably we should not wait till the coming season, but begin at once."

Chairman — If the government asked for 100,000 bags of Lima beans today could they get it, outside the association? What we want to do is to get some kind of a pool together so as to be able to quote in case government or other outsiders ask for it. Some effort ought to be made to get some of these beans together.

Continuing his discussion of the bean situation, which he started in the issue of February 1, Mr. Anton Serres, in a letter just received, says:

* * *

Anton Serres

Yesterday I received a letter from my brother living at Mairy, Department of Meurth-en-Moselle, France. He underwent all the hardships, privations and atrocities afflicted upon the poor people by the Boches during four and a quarter years. The poor people are stripped of everything; their stock, their poultry, their machinery, their crops, their tools and implements, their harness, their linen, and even their clothing has been taken away by the Huns. They were driven to work by armed guards and were nourished by American and Spanish committees, receiving two pounds of dried vegetables and ten ounces of bread daily per person.

They surely would welcome beans shipped to them from America, since these beans would be the cheapest and most nourishing food for them, meat being so high and scarce that it cannot be obtained, Our government made large loans to the Allies; we farmers bought Liberty Bonds and our wives and children bought War Savings stamps, as far as we could stretch our means and our credit, just to help our country and the Allies in winning the war. Many of us farmers borrowed money from the banks to buy Fourth Liberty bonds, hoping to be able to pay our notes given then as soon as we could sell the beans. These notes will soon have to be redeemed or exchanged by other notes bearing a high rate of interest. Some farmers had to sell their bonds of previous issues at a rebate just to provide victuals for their families.

Our government is pledged to assist in feeding the starving nations and will soon launch the Victory Liberty Bonds on the market. We surely would gladly buy the bonds to assist Unce Sam in paying his troops in Europe, in caring for our diseased and wounded soldiers, and in helping the poor people of France and Belgium to start life anew again. There are millions of sacks of beans in our warehouses, ready for sale and transportation to the starving people of Europe. But between our charity and our good will on this side of the Atlantic and the uplifted arms of starving nations on the other side stands the greed of cold blooded food speculation and stops charity and happiness here and abroad. It is not to wonder that Socialism spreads and even Bolshevism gets a foothold, if such conditions can exist in a free country.

I pray all readers to unite and present this condition of affairs to the senators and representatives of their states and of our country, that everybody shall get a fair deal and an appropriate compensation for his labors.

Department Aids Citrus Fruit Growers

The occurrence of the mottle leaf in California citrus orchards is an indication by the plant that the soil in which it is growing lacks some element of plant food. The investigations of the specialists of the department of agriculture have revealed the fact that this condition is more frequently a result of lack of humus in the soil than of any other single soil ingredient. As a result of these investigations much interest has been aroused among growers in regard to the question of the humus content of the soils in citrus orchards, and many growers are using every practicable means at their disposal to increase the amount of decaying organic matter in the soil by the use of manure and cover crops. The department specialists have also conducted soil moisture measurements in citrus groves to determine the distribution and dissipation of water following irrigations and have studied the changes in plant behavior caused by varying amounts of available moisture in the soil during the intervals between irrigations. It was found that frequently all the water available for plant growth was removed from the soil before the next irrigation was made. The determination of this fact has resulted in a more frequent application of water to orange groves on certain soils by many growers.

A Twenty-Mule Plow Getting Into Action in a California Nursery

When this monster "15" plow is started down the long nursery rows thousands of trees are "lifted" in a very few minutes. After it has passed workmen come along and pull the trees from the loosened soil, after which they are taken on monster motor trucks to the nursery yard where they are "calipered", classified, and later placed in either "heeled in" rows or in monster bundles or bales for delivery to the orchardist. This scene is in the Kirkman Nurseries at Fresno.

Agricultural News Notes of the Pacific Coast

Northern California

Eggs in San Francisco have dropped almost to prices which will induce cold storage.

The Oroville Register reports that 90 per cent of the nursery trees shipped to Butte County are prune trees.

Engineers are investigating the bed of the Feather River at Big Bend with the expectation of dredge mining.

In order to protect the established stockmen five year grazing permits will be granted in El Dorado national forest.

Yolo County maintains she is the first county in the state in the production of almonds. Colusa says, "'Taint so, we are it."

Butte County orchardists are encouraging a movement to secure attractive names for all the home places of the county.

Directors of the Solano County farm bureau recently met at Dixon and discussed the labor question, also irrigation and drainage.

Another light rain was given to the entire Sacramento Valley late last week. Precipitation is generally above average at this date.

Lake County and Mendocino County people are supporting the plan to build a state highway from Cisco in Nevada County to Ukiah.

The state senate has passed the joint assembly bill appropriating $300,000 for use of the state reclamation board in building the Sutter bypass.

The legislature has been asked to oppropriate $500,000 to pay for the construction of a highway from Redding, Shasta County, to Alturas in Modoc.

Preparations for bulk storage of grain at shipping points are being made by farmers near Dixon, Solano County and at several points in the valley.

Articles of incorporation were filed February 4 by the Vegetable Growers of California. This includes growers in Sonoma, Marin, Alameda and Santa Clara Counties.

The courts have been asked to prevent the San Joaquin drainage district from constructing a water passage or spillway so as to divert flood waters of the Sacramento into the Yolo Bypass.

The California rice commission of the food administration reports still in warehouses 1,337,350 bags of rice, much of which is not yet in milling condition because of being still in the "sweat."

Sonoma County is considering a plan for building a highway through to the ocean, running through Kenwood, Santa Rosa, Sebastopol, Freestone, Bodega, and Salmon Creek to Ocean View.

A big tractor demonstration will be held at Sacramento this spring, exact date not yet determined. It will be held under direction of the California Tractor and Implement Dealers' Association. R. M. O'Neil will manage the demonstration.

The Agricultural Club of Eldorado County holds meetings at Gold Hill Monday, February 17; Placerville grammar school, 18; Blairs, 19; Georgetown, 20; Placerville high school, 24; Union, 25; Ringgold, 26; Summit, 27; Oak Hill, 28.

Central California

One Fresno County trapper claims a bag of 30 coyotes.

Santa Cruz County is making a fierce drive on gophers.

Turlock shipped last year nearly 2000 carloads of cantaloupes.

Citrus growers of Tulare County are investigating frost protection.

A $20,000 fire occurred at Exeter, causing a loss of fruit packing house.

Kings County farm bureau proposes the organizing of a cow testing association.

The embargo on the use of bean straw as a fertilizer has been removed.

Selma, Fresno County, is growing table beets for delivery to the local cannery.

Tulare County's farm bureau hopes to secure members to the number of 2000 during 1919.

Many discharged soldiers formerly with the agricultural college are planning to finish their courses.

The county farm bureau of San Joaquin has installed Miss Minnie Tribbey, home demonstration agent.

Peach growers of Tehama County are contemplating the construction of a large packing plant at Hanford.

Stanislaus County has 82,570 acres of alfalfa. It is her biggest one crop and totals in value over $4,000,000.

Lindsay, Tulare County, reports total rainfall of 4.05 inches up to January 21, greater than the total up to March last year.

The highest car lot price for hogs at the recent Fresno County farm bureau sale was $16.15 and the lowest priced car was $15.75.

The Tulare County branch of the California Cattlemen's Association met in Tulare and discussed the new regulations relative to grazing permits.

A state highway is to be constructed between San Luis Obispo County and Kern County, which will make quick connection between Paso Robles and Bakersfield.

Several San Joaquin Valley farm bureaus have organized a farm bureau marketing association. The central association is marketing close to $100,000 monthly.

The Tulare branch of the California Cattlemen's Association met recently at Visalia and discussed matter of securing more just returns for California produced cattle.

A representative of the bureau of animal industry is investigating infestation of ear ticks in range cattle on west side of the San Joaquin Valley. He reports there are no Texas fever ticks in that section.

Chairman Fairweather of the committee in charge of the irrigation district consolidation is appealing for renewed interest in this great effort. It is expected President Roeding of the association will call a general meeting of the association as soon as possible.

A number of fruit growers of the Pajaro Valley under direction of the farm adviser have been holding most interesting demonstrations or institutes in their autos, going from orchard to orchard and discussing practical orchard work. The institute began early in the morning and after visits to orchards a basket lunch was a feature.

Southern California

Imperial Valley lettuce is quoted in Chicago at $6 per crate for first class stuff.

Hemet, Riverside County, will plant at least 200 acres to cantaloupes this season.

The Valley expects extended road construction from the new activities of the new state highway commission.

Grain growers are urged to place orders for grain bags for next season's output. A better suggestion, probably, is to plan bulk handling.

Dr. Logan, expert veterinarian of the department of agriculture, is advising thorough cleaning up of hog cholera condition in Imperial Valley.

Applications are being made to the state horticultural commission for large numbers of lady birds to work on the aphis in the cantaloupe fields.

Coachella Valley estimates it will have an output of nearly 3000 date suckers this season. Cutting has already begun. It requires 50 plants to the acre.

The citrus experiment station has made limitation of 180 for total enrollment in its tractor school, February 24 to March 1. There will be ten different makes of tractors used.

Manager R. L. Churchill of the Bean Growers Association has returned from a tour of Eastern markets with an impression that the markets will be worse before they are better.

Castor bean threshers have found great difficulty in handling this product because of the poisonous dust flying from the sheller. Those working on the machine are compelled to wear gas masks.

At the election of the Imperial irrigation district last week the contest centered in the election of J. Stanley Brown, who is a believer in the all-American canal, over W. S. Fawcett. Brown was elected on a nearly two to one vote.

Lima bean growers, in session at Oxnard, Wednesday of last week made ringing resolutions that the bean industry of the United States should have large percentage of the appropriation made by congress to supply food for hungry Europeans.

The biggest orange producing district of California is known as the Pomona district, which has an output of 4400 carloads. Ontario and Azusa-Glendora come next, each with 3000 cars, while Riverside is next with 2850, followed closely by Redlands with 2800.

Attendant in charge of a large Ventura County bean warehouse has been indicted as embezzler because of short weighing deliveries of beans which short weight was afterwards transferred to the attendant's own account. It has been discovered that from a single six ton load shortage of 2000 pounds was made. It is thought the total embezzlement amounts to $30,000.

Riverside is working for the passage of a bill which appropriates $150,000 to purchase land and water rights for a university farm to be located within Riverside County. "The university farm and the instruction given thereon shall be conducted to meet the needs of persons who desire practical instruction and experience in general agriculture, horticulture, animal industry, dairying and irrigation."

The Coast and General

There are 50,000 head of sheep grazing on the desert east of Mesa, Arizona.

The Arizona Cattlemen's Association holds its annual at Phoenix this week.

Walla Walla, Washington, is planning for a tractor show from April 5 to May 1.

February 9 in Arizona was made Roosevelt Memorial Day by proclamation from the government.

Produce exchanges are planning to make a fight on any effort in congress toward price control of wheat.

No more licenses are required under the food control act for any food product other than corn, oats, rye, barley.

Washington state agricultural college located at Pullman is proud of the great winnings in Shorthorns and sheep made at Portland.

The Arizona land board has recently announced that sales of about 75,000 acres of land in Maricopa and Yuma Counties will be made shortly.

Six schools of Arizona have availed themselves of the financial assistance offered by the Smith-Hughes Act and have introduced the teaching of agriculture.

Notwithstanding prohibition hops are now selling at the highest price on record at Portland. Over half a million dollars' worth was sold at 25 cents a pound.

In the last crop report of the United States department of agriculture, Arizona is rated as first in the following crops: winter wheat, oats, hay, cotton, and grain sorghums.

An extension of government canals in the reclamation district, near Yakima, Washington, will be made in a new high line which will bring larger scope of territory under the water.

The Buckeye Valley Farm Loan Association, Arizona, has nearly $10,000 loaned to the farmers of that district. The loans are made at five and a half per cent and run for thirty-four and a half years.

A joint committee from Utah legislature visited the Arizona legislature to consider the matter of annexing that part of Arizona north of the Grand Canyon to Utah. It is not probable that the Arizona legislature will consider the matter favorably.

Under the Enabling Act, 2,350,000 acres of land was granted to Arizona. Lieu lands for school sections located in Indian reservations amounted to 1,645,689 acres. This, together with land grants of 1881 and 1910 total 10,453,720 acres. Of this total 5,140,000 acres have been leased; 482,930 sold and 1,833,024 acres held in forest reserve, leaving a total unleased and unsold of 3,700,773 acres, with about 60,000 acres more to be selected by the state from the public domain.

The following deputy game wardens for Arizona have recently been appointed by Game Warden Joe V. Prochasky: William Simpson, Phoenix, Maricopa County; M. P. Cosby, Benson, Cochise, Pima and Santa Cruz Counties; Charles Ash, Yuma, Yuma County; W. H. Larsen, Lakeside, Apache and Navajo Counties; Al Weber, Prescot, Coconino, Mohave and Yavapai Counties; Osley A. Reneer, Thatcher, Graham, Greenlee and Gila Counties; W. G. Pierce, Hayden, Pinal County.

Turning Under the Cover Crop

Written for California Cultivator By Robert W. Hodgson

NOT MANY WEEKS will elapse before it will be time to think of turning under that cover crop. Conditions quite generally this season have not been favorable for the cover crop. The continued cool weather and lack of rainfall have prevented much in the way of development of tonnage. Further, too many growers as usual have depended upon nature to do it all and have fallen far short of what might have been accomplished, by failing to irrigate the cover crop, always just expecting a rain, which until quite recently failed to materialize. The successful cover crop grower is he who supplies the soil with an adequate amount of water irrespective of the rainfall.

If the greater part of the season's rainfall should come bunched in a rather short period, followed by growing weather, which condition occurred this last season, many growers are going to be sorely tempted to allow the cover crop to go too long before turning it under.

In regulating the time of turning under the cover crop citrus growers would do well to consider a number of facts now generally agreed upon among investigators as well as among the best orchardists. First and foremost, it is now fairly well agreed that the cover crop should be turned under while still green and succulent. If allowed to mature and become woody, not only is it much more difficultly rotted and therefore much more slowly available, but under certain conditions at least its decay in the soil actually locks up what nitrogen might be available to the trees. The large amount of cellulose in the matured straw in its decay draws very heavily upon the nitrogen content of the soil, since the bacteria which effect the decay of this material also require nitrogen in their metabolic processes. And further, at or about the time of maturity much larger amounts of water are required by the cover crop which practically insures that it compete with the trees, which is of course highly undesirable.

Second, and until more recently not recognized as of very great importance, citrus growers are coming more and more to believe that the less disturbance or shock the trees are given just prior to, during and immediately following the blooming period, the better are the chances for a heavy set of fruit. At this critical period the trees, notably certain varieties, are in a delicate condition of balance, any disturbance to which is decidedly prejudicial to the set of the fruit. For this reason any practice which is calculated to shock the trees or disturb this balance is undesirable, and turning under the cover crop at this time certainly constitutes such a practice. By suddenly reducing the water absorbing area, turning under the cover crop at this time may result in actual drouth, for the young fruits, particularly if hot, dry atmospheric conditions prevail, such as frequently occur, and every grower well knows that such a condition is extremely prejudicial to a heavy set of fruit and calculated to induce a heavy "June drop."

The third fact of great importance to every grower in determining just when he should turn under the cover crop has reference to conditions which occur when for any reason the moisture content of the soil reaches a point where not sufficient is present for both trees and cover crop. Under these conditions, and particularly apt to be accentuated at the time the cover crop is maturing, the trees always get the worst of it, the cover crop besting them in the competition for water.

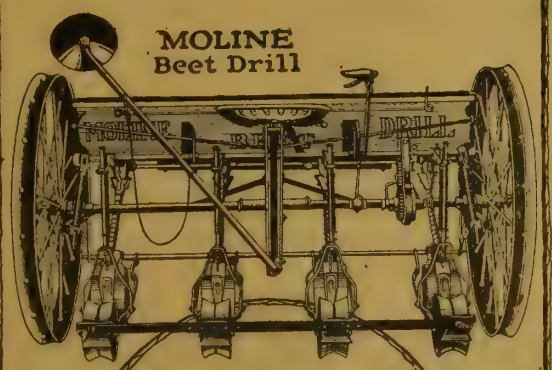
Bearing these facts in mind a grower can decide for himself just how late he can afford to let his cover crop go. For instance, if he wishes to let it grow to tonnage, and many will be tempted to do so this season, he must be prepared to supply irrigation water in large amounts. And if he allows it to go until near the blooming time, he had probably best do no more than a light disking until the critical period is well over, taking care to keep the trees well supplied with water in the meantime. Again, if he does not have much surplus water and wishes to run no risk of allowing the cover crop to compete with the trees, he had best plow before the winter's supply of soil moisture is depleted. Ordinarily this means plowing no later than March 1, and many good citrus orchardists have arbitrarily named this period as absolutely the latest date to which they will postpone plowing.

Depth of Turning Under

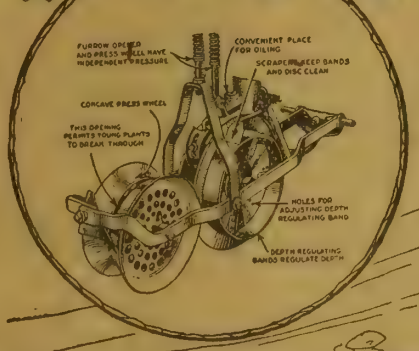
Very frequently one hears the question asked, "How deep shall I plow down my cover crop?" Fundamentally, this probably has to do with the depth of the feeding roots more than any other factor. It is of course very desirable that the cover crop decay in the immediate vicinity of the feeding roots; otherwise much available plant food may be lost. In the decay of the cover crop not only are nitrates formed but soluble phosphates and potassium salts are freed. If one has used cultural methods calculated to induce deep rooting of the feeding roots it is probably not only safe but desirable to plow down the cover crop rather deeply. If the feeding roots are near the surface, however, it may be unsafe to plow deeply, especially if near the blooming period, in the light of the discussion above relative to causing shock to the trees at this time. If plowing is done rather early, or if one waits until the fruits are firmly "set" it may be done more deeply, since in the former case the trees have ample time to recover from any shock before they come into blooming, and in the latter case shock of this kind is no longer sufficient to cause shedding of the fruits.

Disking or Plowing?

Little can be said in a definite way regarding the relative advantages of disking as against plowing. One grower plows, another disks—both obtain good results. In the heavier clayey soils some growers complain about the formation of a hard compact layer just under the area cultivated, following the use of the disk. On sandy or light soils, however, the use of the disk is quite generally satisfactory. The results obtained from the use of any tool, of course, depend largely upon the combination of other cultural practices such as manner of irrigation, condition of soil when worked, depth worked, as well as others, which makes it extremely difficult to check up on the results from any particular tool as compared to another. Fundamentally the question as to what tool to use is largely a question of personal preference.



CITRUS INSTITUTE



The Citrus Institute, in connection with the National Orange Show at San Bernardino February 14-23, holds its first session Thursday morning, February 20. The first topic for discussion will be irrigation and cultivation of citrus orchards. These questions will be discussed by W. M. Mertz of Alta Loma, E. A. Thomas and W. P. Kelley of the citrus experiment station, Prof. C. A. Jensen of the U. S. D. A. and D. C. Lefferts of Redlands.

The afternoon session will discuss fertilization of citrus orchards. This will be handled in its various phases by W. P. Kelley and J. A. Prizer of the citrus experiment station and Prof. A. D. Shamel of the U. S. D. A.

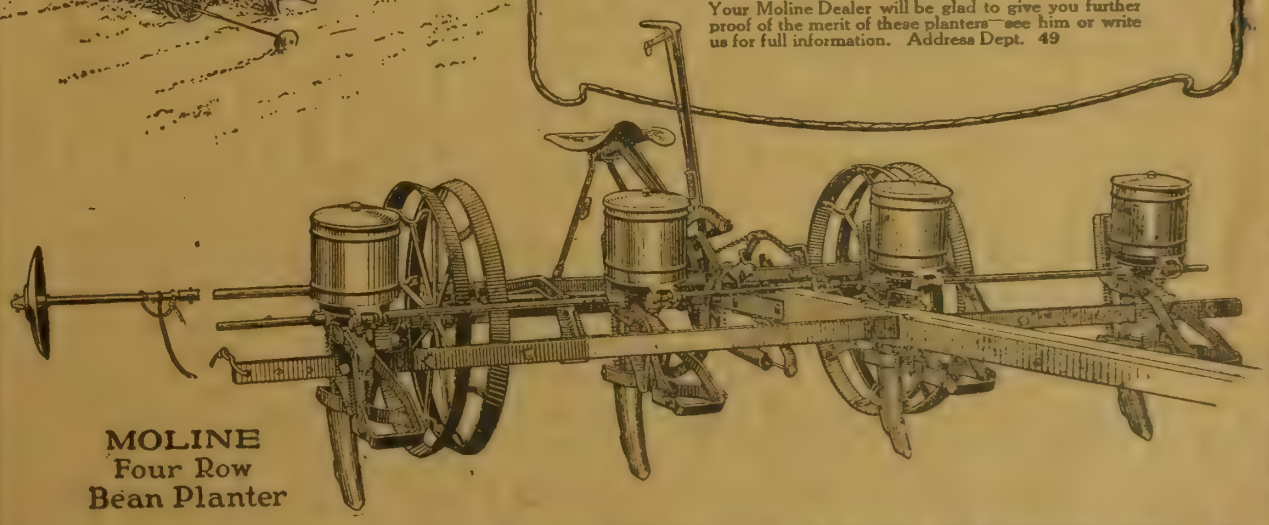
There is to be no evening session, so that the third session will begin at nine o'clock Friday morning, the 21st. The topic for the entire forenoon will be the extension of the citrus industry. This discussion will be led by Dean Thos. F. Hunt, F. O.

PLANT BEANS AND BEETS THE MOLINE WAY

NO matter what kind of seed you have to plant, turn to the Moline line and you will find a tool perfectly adapted to your needs. The two implements illustrated here save time and do splendid work in the beet or bean field.

You know the essential requirements of a beet drill are uniform and shallow depositing of the seed. On the Moline Beet Drill there are exclusive features which positively plant the seed at the desired depth and do it uniformly and consistently, acre after acre, through varying types of soil. No seed is placed too deep—none is placed too shallow—every seed just where you want it, with the proper amount of packing. This one exclusive Moline feature alone will pay for the drill in increased yields. The Moline Beet Drill has many other features which you will like.

* * *



With the Moline Four Row Bean Planter you can plant four rows as quickly as two. You do the work twice as quickly and do it in the best possible manner. Easily and quickly adjusted for rows from 24 to 36 inches apart.

Either edge or flat drop plates can be used as they are quickly interchanged, and because of this feature the Moline Four Row Bean Planter will plant practically any variety or shape of seed ranging in size from a lima bean to seeds of very small size.

Each furrow opener is held to a uniform planting depth by independent spring pressure. Brake pins are provided to prevent damage in case the furrow openers strike an obstruction.

In case you desire a two-row planter there is a Moline Planter for that purpose, too.

Your Moline Dealer will be glad to give you further proof of the merit of these planters—see him or write us for full information. Address Dept. 49

The topic for the afternoon the same day will be frost injury and use of frozen fruit; leader of discussion, Dr. I. G. McBeth of Leffingwell Rancho, C. C. Teague of Limoneira, Thomas Crawford of Los Angeles and E. N. Chace, U. S. D. A.

ANOTHER REPORT ON FROST DAMAGE

E. E. Kaufman, field agent of the bureau of markets, who has just finished investigations of extent of frost damage to citrus growers, reports:

Conditions were found to vary considerably in the different districts and in different orchards in the same district, making the problem extremely difficult. Up to about the 12th of the month temperatures were comparatively low and the fruit did not show as much drying as anticipated, but the last ten days have been warm and evidences of frosted fruit are becoming more pronounced.

An estimate of the damage by districts and counties, based on the estimated production of the same districts and counties, would indicate that about 17 per cent of the orange crop on the trees on January 1 will be unmarketable and that a much higher percentage of the crop was more or less frost-bitten.

The effect on the Valencia crop is problematical, as picking of Valencias will not begin for two months, and this year it is about 45 per cent of the total crop.

In general the orange crop grown in 1918 was underestimated. The estimate of the bureau was made as of November 1. Shipments up to the holiday season would indicate an underestimate of about 10 per cent. Up to and including January 5 orange shipments totaled 4555 cars from November 1. About 500 cars were shipped in the next seven days, most of which were probably picked before the freeze, making a total of about 5000 cars with no frost damage. The balance of the crop, estimated at nearly 30,000 cars, will be affected by frost, indicating at present 5000 cars of unmarketable oranges.

The above estimate of cars has in mind the present loading of 462 boxes to the car.

Lemons

Apparently the greatest damage to the lemon crop is confined to the small fruit which would not have matured for a few months, and quite likely shipments of lemons may not be much curtailed for some time. Estimates vary widely as to the damage in the different producing districts and can be summed up at not less than 25 per cent for the state, with a possibility of reaching 30 per cent or more as the season advances and conditions become more favorable for determining the real extent of the damage.

Adding Humus

WE WELL recall that in the good old days of demonstration trains Prof. Shaw, at that time connected with the state university and now with the federal farm loan bank, in his talks on farm fertility had one slogan which he repeated at every meeting, and that was "With all your getting, get humus."

As a rule we think the orchardist understands the necessity of the above injunction, but too often he is in such a situation that he asks where and how. All amounts of stable manure are now all picked up until scarcely a straw escapes. Baled bean straw and even baled alfalfa hay is sometimes purchased to keep up soil fertility. The cheapest of all, and perhaps the best, is the cover crop which is being used generally in most all orchard sections. More recently many orchardists have been asking why not use the prunings of their own orchards, giving back to the soil the fertility taken from it by the growing of these unwanted parts of the tree.

Prunings For Humus

The illustration herewith is a Cultivator photo taken in a La Verne orchard. In this orchard the pruning has been regular, hence the branches removed each year are very small. They are thrown between the trees as shown in the photo, though being in the shade of the tree the piles are not plainly shown. In addition to these prunings there is a cover crop growing, but owing to the dry season it was not, at the time the photo was taken, as heavy as it will be after the rains. This particular orchard is not plowed but these branches of prunings and the green manure crop will be disked in. By the time the disking is done the prunings are dry and brittle and are broken into small bits by the action of the disks. Other orchardists have preserved these prunings and other rubbish underneath the trees, which in a period of years break down and add to the vegetable mould underneath the trees.

At a recent meeting of the Los Angeles center of the county farm bureau, Dr. J. Eliot Coit, farm adviser, made an address on the topic of humus, and some of the ideas advanced were materially different from those usually held by our orchardists. Notwithstanding many have held — at least some have—that thoroughly ripened weeds or green manure crops, those which contain the greatest amount of cellulose, carry the greatest amount of humus to the soil as the result of decay, Dr. Coit in his address maintained that the benefit to the soil in plowing under green manure crops was not in the residue or a substance which may be called humus, so much as in the process of decay. The plowing under of a vast quantity of young, lush herbaceous matter results ultimately in an exceedingly small quantity of vegetable matter remaining in the soil, for, as is well known, such material is made up principally of water. But, as noted, Dr. Coit's idea is that the benefit from the process of decay, and the green young growth, which decays so much more quickly, give the quickest and best results. In fact, warning was given against applying large quantities of dried barley or rye straw. Unless there is sufficient moisture there is danger of these dry stalks being slow to decay and favorable to the denitrifying bacteria.

Of all manures which have been tested under careful observations, manure from poultry has proved of high-

est value. In a general way Dr. Coit suggested that hen manure has three to four times the value of any other manure.

BOLSHEVIKI IN THE ORANGE GROVES

The citrus growers of Southern California, especially in the San Gabriel Valley, have been having experience with Mexican, Jap and Russian Bolsheviki. A few of these agitators have been getting "jobs" in the orange groves since early in the season. More recently their forces have been increased by professional agitators and demand has been made for $4.00 for eight hours work. On the refusal of the growers to pay such wages more active agitation began and circulars similar to the following were distributed to the men who remained true to the job.

The Circular

"To the workers in the orange belt:

"Are you satisfied with your conditions? Will you continue working for a boss for small wages and long hours? Or would you rather have more wages and shorter hours? Today you are getting about three dollars for nine hours work. Do you want these conditions changed?

"You are the only ones who can change them, but to do so you must organize as a class in the whole orange belt in one big union of all workers. The Charter Oak pickers are out on strike for $4.00 for eight hours. Will you join with us and present your demands to the boss?

"Workers in every industry are bettering their conditions; why not you? You receive less wages for longer hours and harder work than most other workers.

"If all Americans, Mexicans, Japanese, Russians and other workers in the orange belt stand together we will be able to better our conditions. Organize strike committees and put your demands up to the boss and we will all win.

"Don't scab, nor work any longer until these demands are granted.

"A strike is on for $4.00, 8 hours. Stand solidly together.

"Charter Oak Strike Committee."

As noted, this is signed by "Charter Oak Strike Committee," and that section, more particularly Covina, has been the center of the fight. The growers organized and appointed committees to take charge of the entire matter. The sheriff of Los Angeles County also appointed committees and arrests were made and jail sentences given to some of the more violent. The action has been so firm that the agitation is lessened and the growers are now finding little trouble in securing sufficient help.

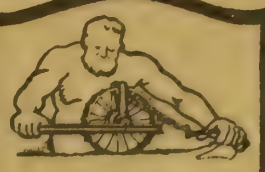
CITRUS WHITE FLY

The citrus white fly, which appeared some years ago in Kern County, but was thought eradicated, has reappeared and is now receiving attention from the state and county horticultural commissions. Harry S. Smith of the state insectary, with County Commissioner Buhn of Kern, have investigated and report:

"While the infestation is small it is difficult to handle because of the dense jungle in which it is found and because of the nature of some of the host plants, such as the English ivy. Six men started work on the defoliation February 1."

WHAT TO DO WHEN THE GAS ENGINE BALKS

A gas engine on the farm is a great labor saver or a great time waster, depending upon the skill of the operator. An unskilled man may spend more time and energy in trying to start an engine to pump water or do some other task than would be required to do the work on hand. Often crews of workmen hired to help thresh, bale hay, cut ensilage, etc., draw full wages for hours spent in idleness, owing to inefficient handling of the engine. Such delays are preventable, for engine trouble is usually due to the operator's ignorance of some of the details essential to proficient operation. Knowledge of the engine, then, is one way to conserve farm labor and avoid trouble.



To supply such knowledge the United States department of agriculture has recently published Farmers' Bulletin 1013, "Practical Hints on Running a Gas Engine."

See That Hitch!

THE Nilson Patented Lever Hitch is the greatest improvement in Tractor Design in recent years.

By hitching the plows to a swinging drawbar attached considerably above the rear axle, the pull of the plows is automatically converted into downward pressure, thus giving the drive wheels "GRIP" or traction, without a pound of useless weight.

It enables us to build a tractor with BIG TRACTION, LIGHT WEIGHT, FUEL ECONOMY.

The Lever Hitch carries the pull of the plows up over the drive wheel. The harder the pull, the better the wheel grips the ground. Note great width of driving wheel surface.

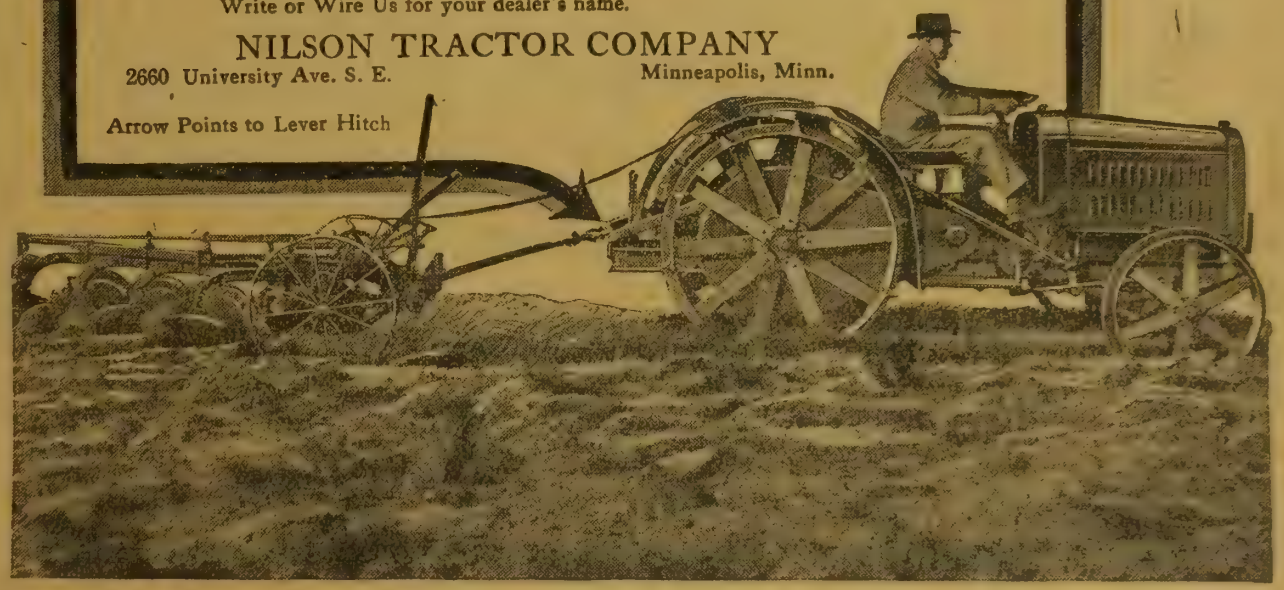
Found Only On

The Nilson

Because of the Lever Hitch the Nilson Junior, weighing only 5,000 pounds, has 3,000 pounds drawbar pull at plowing speed, while the Nilson Senior, weighing only 6,400 pounds has 4,000 pounds drawbar pull at plowing speed.

Nilson Tractors employ three driving wheels keyed on the same axle, making in effect a WIDE DRUM DRIVE. They do not pack the soil. They stay ON TOP.

It is the Lever Hitch and Drum Drive that enable the Nilson to easily outclass other tractors—even those equipped with the same Waukesha Motor used in the Nilson.



Nilson Tractors have been thoroughly tried out, and have "made good". See them demonstrated in the field.

Plant TREES

and make your land produce a greater revenue

Write For Illustrated Catalogue

and Learn How to Plant and Grow Trees Successfully

THIS BOOK answers in a satisfactory manner many questions which you may want to know, for instance if you are going to plant plums, what kind?

Early varieties of peaches bring good returns, but an assortment of peaches ripening from May to November is in many cases preferable.

While the Tilton Apricot is the canners' favorite, there are others equally good. Some trees grow and bear best in the warm interior valleys while others do better at a higher altitude along the foothills.

Growing almonds has become very profitable. Do you know whether your locality is suited to almond culture?

If you are in doubt as to what trees would do best on your land, write to us, describing as fully as possible all of the conditions, and we will be glad to advise you.

The Fresno Nursery Co.
P. O. Box 615-C
Fresno, Calif.

To California Farmers:

You may have a commercial orchard, or merely an assorted Family orchard, but your farm is incomplete and unsatisfactory unless you have suitable shade trees and ornamental shrubs. Our collection is equal to any in the state, and suited to any soil or climatic condition. Also, do not forget the "wood lot." Eucalyptus trees are best for this purpose.

To Landscape Gardeners:

You will understand the importance of the above remarks, and you will be satisfied with our stock and prices, whether you are laying out extensive grounds or advising as to the proper parking of a town lot. If you see our stock you will be convinced.

Almonds, Apricots, Pears, Prunes

and all other fruit trees yet in good supply.

The Wonderful Jarrah Tree

Written for California Cultivator By Ernest Braunton

LOOKING over an Australian timber journal there is found among the advertisers: "M. C. Davies Karri & Jarrah Co.; The Jarrah Timber and Wood Paving Corporation; The Westralian Jarrah Forests Co.," and a full dozen others, all with the name "jarrah" incorporated. The advertisements read: "Contractors to West Australian government for sleepers, etc. Perth City Council for paving blocks, kerbing, etc." Also "Karri and Jarrah timber, sawn, hewn, or squared baulks, any lengths; scantlings up to 100 feet. Squared or round piles, beams, girders for bridges, wharves and railways up to 90 feet long. Railway sleepers, telegraph poles, T. and G. and dressed flooring, weather boards, mouldings, architraves; also paving blocks."

And all this from one tree, the "jarrah," native name for Eucalyptus marginata, one of the most wonderful of that wonderful family of trees. No other trees on earth are put to such a variety of uses, and the lumber is second to none. It is not uncommon to find considerable areas of this tree where many of them are 120 feet high, five feet in diameter and 70 feet to the first branch. These trees enjoy 38 inches of rainfall each year and grow in rocky soil of ironstone foundation. As soon as the trees reach granite formation they fall away to mere scrubs. This fact will sufficiently account for the lack of commercial plantings of this tree in California. It is a semi-coastal tree, as are nearly all eucalypts, and reaches its greatest development at about 20 miles from the coast.

The jarrah is famed for its indestructible wood; it is immune to white ants, the teredo and other insects and pests that destroy lumber and piles through borings. Houses built of it exist in perfect preservation for 100 or more years. With age it seasons so hard it cannot be worked or nails driven into it, and when struck the wood rings like a bell. The oldest piles the government could find had been in a wharf for 60 years and were evidently as good as the day they were driven. Railway sleepers or ties laid down 18 years before were as good as ever.

There are many species of nearly equal value that thrive at their best in California, but their greatest value for lumber will be at from 50 to 100 years of age. We are not in need of more eucalyptus booms to convince us that some day this lumber will be the most valuable in California.

Plant Phenomena

Why does the hop vine twine about its support in the same direction as the sun turns, and why does the morning glory twine about in the opposite directions? If part of either species of vines turned both ways one might study to find out why one hop turned to the right and another to the left. We would expect to find some local influence or object responsible that we could find or see. But all vines of one kind or another turn the same way and cannot be made to grow around in the opposite direction. Why does the leaf of the bauhinia and other plants of the same family fold upwards at night, while the leaves of the oxalis and other plants fold downward? Why do they close at all? Why does our California poppy open its blossoms in the day and close at night, while other flowers do the reverse?

Old Tropical Fruit Trees

The avocado was introduced to California by Judge Ord of Santa Barbara about 1870. There should have been equally remote introductions into other points in Southern California, but there are none recorded. Of these two are still growing (or were a few years ago), one in Santa Barbara, the other at Montecito.

The oldest tropical fruit tree is perhaps a white sapote growing in Santa Barbara. The crown is 50 feet high and 60 feet across and for years it bore a good crop of fruits. Finally it got loaded with black scale and was utterly neglected and so ceased to bear. The trunk of this tree is about three and one-half feet through and its age is said to be at least 90 years. In view of the ages of these trees and the excellence of the fruits, it is indeed strange they did not earlier become well known.

Sterilization of Soils

It is an easy matter for anyone to experiment with sterilization of soils. In small quantities, for seed pans or boxes, the soil may be baked in an oven, but this is slow and bothersome. The simplest and best treatment for small beds outdoors is by the application of boiling water. Now is the time to try this method. Choose a bed outlined with battens or other curb and put a board division through the middle. Treat one-half with boiling water until soil is saturated. Leave the other half untreated. When soil is dry enough sow any garden crop in both beds and note results. One bed so soaked showed an average temperature four inches below the surface of 145 degrees a few minutes afterward. It was planted to lettuce and grew 35 per cent more in weight than the untreated half of the bed.

Value of Wood Ashes

All the wood ashes available should be put in the garden. For years I have applied ashes to one-half of a bed and none to the other half, both halves being treated alike in every other respect. The effect has been most gratifying to a variety of crops, especially on bulbous plants such as gladiolus, daffodils, Spanish iris, anemones, ranunculi and freesias. The ashes have each year resulted from burning garden prunings, etc., with some wood, but soft woods only. Ashes from hard woods, nearly a hundred samples, tested in Massachusetts showed one-third lime and that in a most superior form. Potash averaged between five and six per cent, and phosphoric acid nearly two per cent. It will readily be seen that all vegetable ash should be applied to the garden, and at any season.

Protection from Fungi

We should sedulously protect plants and soil from fungous troubles. Above the soil we must spray; below lime will aid as much as any other agency. As an illustration of the destructibility of fungi, let us consider wood. Rightly used and protected it is practically indestructible. Tools, furniture, etc., have been preserved for thousands of years. Wood in soil or water would last equally if protected from the depredations of living organisms. Fungi is as destructive to plant life as it is to human life when some poor soul eats poisonous toadstools or mushrooms, and most aggravating garden troubles come from this source. From mildew to toadstools we should fight all these forms of fungous life, and, as before stated, lime is a powerful and beneficial agency.

The Biggest Trees

A traveler named Swinburne measured the gigantic chestnut (Castanea vesca) at the foot of Mt. Etna, in Sicily, about 10 years ago and found it 196 feet around, or nearly 65 feet in diameter. It is now so much decayed that it cannot be accurately measured, but many measured it girth while in full vigor. It is by far the largest tree ever reported. The greatest diameter of any American tree is that of the Montezuma cypress of Mexico (Taxodium mucronatum) which grows to 40 feet through the trunk. This is a fine evergreen tree and thrives well in California, is on sale in local plant depots and is deserving of more general planting. Fine specimens are growing on the H. E. Huntington estate at San Marino, near Los Angeles. The oriental plane also grows to 40 feet and grows as well in California as anywhere. Our Sequoia gigantea stands next, with 35 feet diameter.

Church Decorations

BREAKING THE I-C-E

When Alice Jones was 18 she became Miss E. Alysse Jones. When she went to enter a college she was asked her name by the dean. She replied:

"Miss E. Elysse Jones — A-l-y-s-s-e."

"Yes," said the dean; "and how are you spelling 'Jones' now?" — The Tatler.

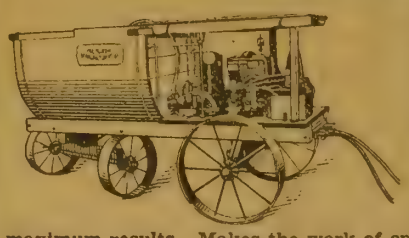
ALPHA
POWER SPRAYERS

For Heavy Pressure Spraying

EVERY feature desirable or necessary for quick, thorough spraying will be found in the Alpha Sprayer. It is the simplest, most accessible power sprayer made. Its reliability lies in the simplicity and strength of every part as proven by its performance in the field.

Driven by the easy-starting ALPHA ENGINE and equipped with our dependable automatic pressure regulator, the Alpha Power Sprayer has proven its superiority to growers who have used all the best known makes.

ATTRACTIVE PRICES. We are in position to offer Alpha Sprayers at prices probably lower than other sprayers of equal capacity.



Write for Complete Specifications.

De Laval Dairy Supply Co.

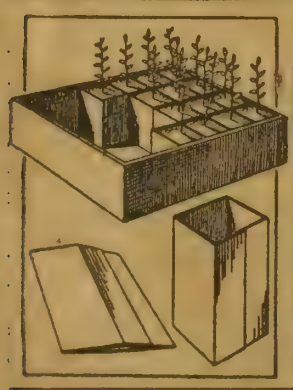
18 Years Back of Hardie Sprayers

High Pressure, Light Weight, Large Capacity, Powerful Engine, Perfect Agitation, Simple Construction

HARDIE POWER SPRAYERS are the final word in sprayers. They represent not only years of experience, but also an accurate knowledge of spraying needs and the conditions that govern spraying. Where spraying is most difficult you will find HARDIE Sprayers in the majority.

HARDIE SPRAYERS are noted for their simplicity. No complicated devices to cause trouble when every minute counts. You can put any of the help to work with a HARDIE and get maximum results. Makes the work of spraying easier than ever before. When you see a HARDIE SPRAYER you will readily understand its superiority. See how compact it is—the few working parts and how everyone of them is quickly accessible. There are 21 HARDIE features that make it the leading power sprayer. The HARDIE CATALOG tells all about them. A COPY is yours for the asking. Send today. You can see a HARDIE at your dealer's.

The Hardie Orchard Gun $12.00



The latest HARDIE device made to improve spraying conditions, shoots a cloud of penetrating spray, covers the trees with a fog. Easy to handle. Takes a tiresome load off the arms and does the work in much less time. Fits any high pressure sprayer and increases its efficiency.

Order a Hardie ORCHARD GUN from your dealer or direct from us. Money back if not satisfactory.

Questions and Answers

ANSWERS BY EDITOR AND STAFF

Questions to be answered in this department should be received at the office one week before reply is expected. Write plainly on one side of the paper and sign full name and address. Unsigned communications receive no attention.

Taking Cold

Please tell me what is the matter with my chickens. As soon as it begins to rain they get sick, put their heads down and groan. In a few days they die.—Subscriber, Solvang.

Your hens are taking cold. Is there a crack or knothole back of the roosts? Does the rain run in and wet the floor, or do they have to wade in puddles of water when they go outside to pick up their grain? Perhaps your henhouse is in a low place, where the water runs into the yard and stays instead of running off. Perhaps there are too many hens in the house. If they are crowded they get too warm, and then are chilled when they come out in the morning, especially if they have to come out into the rain. The only way to cure them is to see that their house is dry, but well ventilated, and that each hen has from two to three square feet of floor space. That is, if your house is eight feet wide by ten feet long, it ought not to be expected to accommodate more than 30 hens. If it is ten by twelve, you can put in from 40 to 50, according to the size of the hens. A henhouse ought always to be on ground a little higher than the ground around it, so the water will run off when it rains. If you keep your hens warm and dry, and give them plenty of fresh air at night they will not have colds or roup.—J. A. K.

Frost Protection for Deciduous Blossoms

Please let me know if smudging or orchard heating, to protect cherries from frost while in bloom, has ever been practiced. If so, is it practicable, and what methods are used?—Subscriber, Sebastopol.

Yes, millions of dollars worth of apples were saved by the orchardists of Oregon, Idaho and Washington in a frost fighting campaign a few years ago. We believe frost fighting in deciduous orchards has proved fully as satisfactory as in citrus orchards.

Sub-Irrigation

Our plan is to put down into the ground one and one-half feet, three inch, one foot drain tile, and not drain the ground but work the other way and flush the pipes. If necessary in winter rains the surplus water can be drawn off. Has this system ever been tried to your knowledge? Please tell me when and where and with what results. We have tried it in a small way for two years on a line of 60 feet and it has worked splendidly. We have raised peach trees with a growth of twice as much as the old way. What kind of legal protection is to be had?—Subscriber, Montebello.

In addition a Los Angeles subscriber writes of having experimented with sub-irrigation for two years and wishes to know as to whether it ever has been proven successful.

Sub-irrigation is most attractive in theory. It has been tried persistently and so far as we know never with continuous success. When the system is first installed it is very often a complete success, but clogging of pipes with roots soon results and the expensive installation is removed or neglected. We well recall, more than 30 years ago, the installation on a tract near San Diego of sub-irrigation plant at a cost of about $300 per acre. The land was planted to orange trees, but we believe the entire plant was later abandoned. That particular system was of the perforated concrete pipe. Patents have been granted on other systems and upon machines for laying perforated pipe. King's "Irrigation and Drainage" says: "This system of irrigation quickly suggests itself to most thoughtful men when they first began to handle water for irrigation, on account of the many difficulties and inconveniences which are associated with surface watering; but there are several very fundamental objections to it which have usually led to its abandonment sooner or later in nearly every place where tried."

Amongst the objections to the system may be noted: First, expense; second, clogging of pipes with roots; third, on porous soils the great loss of water because of percolation and the lack of capillary movement which makes for relatively slow lateral distribution. In some soils it would be necessary to place the pipes exceedingly close together. Of course there are some soils where even with a canal along the hillside, where bed rock and subsoil conditions are exactly right, acres may be sub-irrigated naturally with the one irrigation ditch.

King's book, already referred to, discusses sub-irrigation at some length.

Our Double and Single Acting Deep Well Cylinders Are Marvels of Simplicity and Efficiency

They have been perfected after fifteen years of practical experience.

as does Newell in "Irrigation." Each of these books gives diagrams of sub-irrigation plots. In answering one point raised by the Montebello subscriber legal protection may be had by the securing of patents. It will probably be necessary to employ a patent attorney and make investigation as to former patents granted and for directing legal procedure. We will be glad, indeed, to hear of later success of the plans referred to.

NAPIER GRASS

There has been a continual calling for a forage grass adapted to California conditions, and we presume the calling will continue, for the grass which will give perfect pasture on California's semi-arid hillsides will never be found, but fortunately the calling is resulting in some satisfactory discoveries.

We have in the past referred to Para, Paspalum, Rhodes, and more recently, to San Diego or Smilo grass, and now comes a new fodder producer in Napier or Elephant grass. Mrs. Florence E. Galbreath has grown this successfully in the San Joaquin Valley. From her description of it it must be true to name, for we note that it grows to a height of 15 feet. This grass was found in Africa and from there taken to Australia and secured entrance to the United States from Australia. Because of this fact it has been sometimes known as Australian Giant grass.

Feeding Value

The chemist of the Rhodesian department of agriculture has furnished the following comparative analyses, published in the Rhodesian Agricultural Journal:

Napier grass, partially dried sample —water 55.33, fat .84, protein (nitrogen x 6.25) 3.10, carbohydrates 21.16, fiber 15.66, ash 3.71. Fresh; water 61.81, fat 1.29, protein 2.92, carbohydrates 17.29, fiber 14.77, ash 2.92.

The botanist of the Agricultural Supply Association in South Africa makes the following report as to its habits and uses:

Habits and Uses

Napier grass is a coarse, reed-like perennial grass, 10 feet or more high, having thick stems somewhat like those of sugar cane, and producing them so freely that a single rooted cutting will develop a dozen or more stems in the course of a season. "Like Pearl Millet (Nyouti), it is reported to be an extremely good drouth resister. Colonel Napier and Mr. Kenny both state that it remains green on dry land late into the autumn and withstands frost to a remarkable degree. Colonel Napier has tested it under most severe conditions, and is firmly convinced of its economic value." Mr. H. G. Mundy, government agriculturist and botanist, Salisbury, reports that it is equally, if not more drouth and frost resisting than Paspalum dilatatum.

FRUIT SYRUPS

As regarding farm economies, we have below a couple of articles touching upon home making of fruit syrups.

Grape Syrup

I saw an article in your paper a short time ago on converting grapes into syrup which turned me back to '92. We had moved to Guinda, a new town in western Yolo County. There we had seven little mouths to fill. This took some planning, I can assure you.

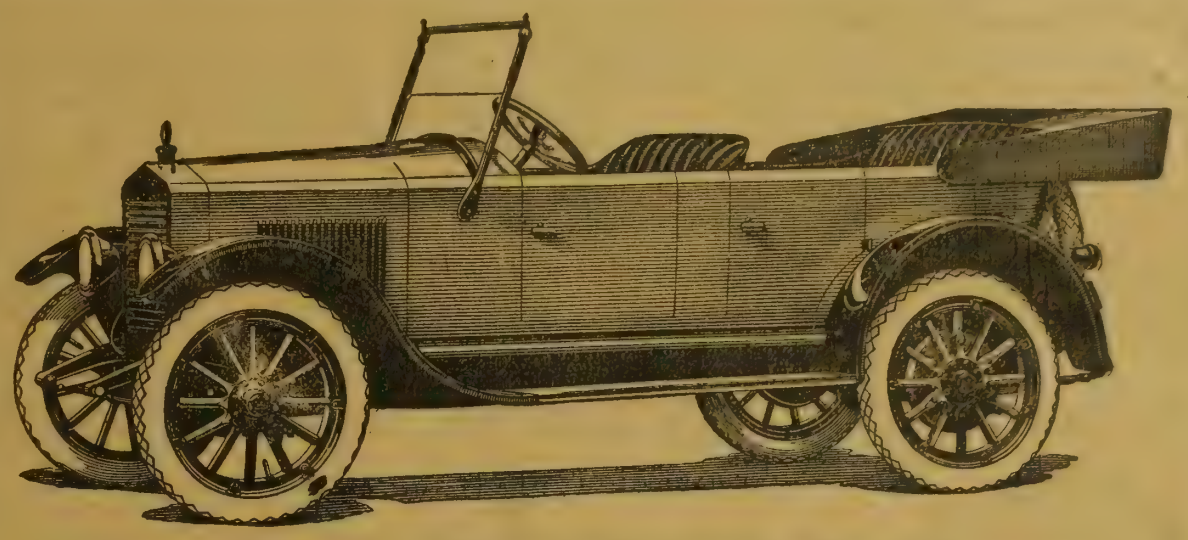
About that time a vineyard near Rumsey was purchased by a "Prohi." He would not sell the grapes to the winery, but gave to the neighbors. When a child in Illinois I had often watched my father make syrup from the sorghum cane. Why couldn't syrup be made of grapes? It was worth trying and though the process was long and tedious the result was a bunch of happy children eating bread and syrup. I think the grapes were the Mission variety. I found that the Tokay made a lovely preserve without sugar.

Perhaps at the present day it would not taste good, but then by children raised on mush, rice, milk and other plain food, who knew nothing of candies, dates, etc., except on Christmas and Fourth of July, it was pronounced good.—Mrs. Isaac McGrew.

Fruit Syrup

When making jelly of berries I cook them and drain lightly, then press them through a sieve to take out seeds, adding a little water if needed and sugar. Cook to a butter or marmalade. And the same with plums, apples, peaches, pears, quinces, in fact any fruit that does not jelly easily.

I pare and core or seed and cook the parings and core as for jelly and boil down the juice to a syrup by adding sugar to make it thicken.



But peach syrup has a bite to it, so after draining out all I can get, I put it into the kettle and add precipitated chalk as I would soda to sour milk and boil it up just a little, then drain again and add the sugar and boil to a syrup, and I have a better hot cake syrup than I ever found in the store, and it is good for cooking also.

I use any kind of grapes in the same way, then feed the waste to the chickens and dry all the large seeds to burn.

And if anyone can do more with fruit I would like to have the idea.—A Subscriber, Galt.

ACCURATE

A Brooklyn Sunday school teacher once had occasion to catechize a new pupil whose ignorance of his Testament would have been amusing had it not been so appalling. One Sunday she asked the little fellow how many commandments there were. To her surprise the lad answered, glibly enough, "Ten, ma'am." "And now, Sammy," asked the teacher, "what would be the result if you should break one of them?" "Then there'd be nine," triumphantly answered the youngster.—Fun.

Have You Ridden In The Essex?

It Is The New Moderate Priced Fine Car—Price $1395

The Essex must have made a hundred thousand friends since January 16th, the day on which it was first shown in all parts of the country by hundreds of dealers.

It is the new light, moderate priced car that has the endurance, comfort and rich completeness that you expect only in large and costly automobiles.

Most of the hundreds of dealers who will sell the Essex have been doing business with us for a long time. They know the kind of cars we build.

Under those circumstances they were not as skeptical as they might otherwise have been about a car of which no details were given. But even if they had felt uncertain because of the newness of the Essex, all doubt was removed as soon as they had ridden in it.

That is a distinctive characteristic of the Essex. It is remarked by nearly everyone. Pride of ownership does not alone spring from beauty and richness of detail and finish. It is mechanical as well as optical. Something more than the sense of sight must be gratified.

A Light Car Anybody Will Be Proud To Own

The Essex is beautiful to behold. The very feel of the comfortable cushions, with their high backs, associates the moderate priced Essex with costly cars. The owner need never apologize for either its appearance or performance. Squeaks do not develop, as in other cars of its type, because an unusually heavy frame assures absolute rigidity. Body bolts cannot work loose. The finish will long retain its freshness.

Ride In The Essex Over Rough Roads

Every dealer is demonstrating the Essex over the roughest pavements in his locality. It reveals a new distinctive motor car quality. You might easily think you are in a long wheelbase car weighing two or more tons. This feature alone will appeal to you with more than ordinary interest.

The Essex motor deserves your special attention. Note how it is arranged to get the maximum power from every drop of gasoline. See how stable it is and why it is free from the need of tinkering and attention. The Essex has stability. It has quality as well as lightness; endurance and comfort as well as a low first cost. These things will be apparent when you see and ride in the Essex.

Keeping One Cow

Written for California Cultivator By H. Culbertson

THE question is asked, Will it pay? Like many other things it depends on the one behind the gun. With feed as high as it has been for a few years the cost of keeping any animal is an important question. It will require from five to six tons of the best of hay and about 3000 pounds of bran or its equivalent. Five tons of hay at $25 per ton will cost $125, and the bran about $67, or a total of $192 as a basis for the cost of keeping. The time required to care for feed, water, milk, etc., is about three-fourths of an hour per day. After the milk gets to the house the straining, skimming, washing and scalding of pails, pans, etc., churning and working of the butter and washing of cream vessels and churn will average another three-fourths of an hour. The milking period will run 11 months, or 330 days. The total time put in outside and inside is about 500 hours. At 25 cents per hour this costs $125, making the total cost $317 for the year, nothing said about taxes, investment in cow, stable, etc. It will be noticed that the cost altogether is almost one dollar per day for the 330 days.

What has the cow to do to pay for all this trouble she gets us into? Ten quarts of milk per day for 330 days at ten cents per quart will do it. This would save the labor of the butter making. But a cow that will average ten quarts per day for 330 days has to give 16 to 18 quarts per day for part of the time to make up for the small amount she may give near the end of the milking period. This means that it is pretty difficult to keep milk customers with such irregular supply. Hence the unsold part would have to be used in the family and made into butter, etc.

How does it look when all made into butter? If the average of ten quarts of milk were made into butter, the milk testing about five per cent butter fat, the yield would be one pound per day, or 330 pounds for the season. We will suppose the owner is looking ahead and has the largest yield come when butter prices are high, say an average of 50 cents per pound. Then the year's yield would be $15. Taking this from the total cost as above leaves the cow in debt to the owner about $150. There would be however about $30 worth of skim milk and $15 worth of fertilizer, which would reduce the loss to a little over $100. Evidently the one pound of butter a day cow has not the capacity to do the amount of work required to pay for her keep. The only thing we can do is to sell her and get a higher priced one that can pay her cost of keep. The cow that can do this must average pretty close to 600 pounds per year. If the period of greatest production comes when butter is 25 or 30 cents the showing is not good. The cow of the latter capacity will require a greater cost of feed than we have taken as a basis. If the gross income equals the above estimate the owner gets his wages for the time. If he grows his own hay he gets about what he could sell it for in cash to some buyer. It is quite evident from the above that much of the one cow dairy business is unprofitable.

Conditions on many farms are such that the cost of labor and material need not be held as so important. There is often labor on the farm that need not be fixed as high as above estimated. Or the time of a better paid person in his nine hours per day might be used at a time when he would not be earning anything if he did not have the cow, or a part of the labor be performed by some member of the family who is not earning anything.

The feed question can often be modified. There are often feeds that a cow can get on a place that would otherwise go to waste. A part of the year there are volunteer grasses. Then there is the waste from cabbage, cauliflower, beets, the small sweet potatoes, etc.

If there is plenty of water for irrigation one-third of an acre in alfalfa well cared for will furnish all that kind of material they need. Alfalfa cut and fed every day for seven months of the year is an excellent milk producer. One-tenth of an acre in stock beets will help to make a balanced ration and increase the milk flow.

A mistake is frequently made by those buying all their feed in buying only alfalfa. The cows like it and eat it greedily for a while. In the course of a few weeks they will not eat enough of it to do their best at the milk pail. At least one-third of their hay feed should be early cut oat or wheat hay. This makes a better balanced feed and they do well. If the stock beets can be had in plenty they will take the place of the grain hay.

There is however another viewpoint to take beside the one of dollars and cents. In families of growing children we cannot figure it from the dollar standpoint alone. Fresh sweet milk has its place in the family that nothing else quite fills. It takes an important place in both health and nutrition. It is a well balanced ration. It is not difficult of digestion. The fresh made butter has its place in the household. Skim milk makes fine cottage cheese. A little cream mixed with it adds to its flavor and nutrition. Then if the cook does not depend on baking powder recipes there are dozens of ways of using milk and cream, buttermilk, sour milk, etc., that add much to the comfort and nutriment of the household. Skim milk will increase the number of eggs and the quality of the table poultry.

Champion Dependable Spark Plugs

Wins Out In Government's Severe Shock Test

At the factory of the Chalmers Motor Car Company, of Detroit, Michigan, the United States Government was conducting a most exacting ignition test of the Holt-Caterpillar Tractors, used in war-work for hauling cannons, caissons, etc.

With motor at high speed under heavy load, the spark plugs at sizzling heat were doused with a bucket-full of cold water.

This most severe test had not the slightest adverse effect, the operation of the motor continued perfectly, not a spark plug "missed" even temporarily.

Every motor car owner has, in this test, irrefutable proof of the hardiness and efficiency of Champion Spark Plugs.

There is a Champion Spark Plug for *every* type of motor car, motor truck, tractor, motorcycle and stationary engine.

BULK HANDLING

Another step has been taken in the bulk handling of California grain in that the railway equipment is fitted to this common sense method. Following the practice of Eastern railways, grain boards are fitted to the box car doors and reach just above the level of the indicated loading line of the lightest weight grain to be handled. This grain loading line, which can be seen in many box cars, appears at various heights above the car floor and indicates the level necessary for reaching the minimum load or rated capacity of the freight car. Wheat being the heaviest grain ordinarily handled, the wheat level is the lowest indicated on the car walls. Barley, oats and corn all are given different loading levels.

Large advances have been made in all methods of handling shipments since those early days when wheat was one of California's principal products, with the exception of wheat shipments, scarcely any change having been made in the method of handling and shipping it. In fact the same expensive, wasteful grain sack is considered by the majority of grain farmers in California, as the only way in which to store and ship it.

BRITAIN OVERSTOCKED WITH WHEAT

THE agricultural correspondent of the London Times is a bit glum about the farming situation in Great Britain. Says he in the issue of January 6, "The markets are already turning against the home farmer and the explanation is to be found in the concentration of tonnage on the carrying of certain commodities and the neglect of others. The results of recent shipping show defective understanding of farming requirements.

"The most conspicuous example of imprudent control," says the correspondent, "is the excessive importation of wheat and the failure to procure for stock owners the feeding stuffs, the want of which has so long hampered the output of animal products. Concentrated stuffs, essential to intensive methods of animal husbandry, are coming to hand in wholly inadequate quantities and owners of stock are sorely exercised to keep their herds and flocks in good condition. Promises of great quantities have been made from time to time but the improvement so far is insignificant.

"On the other hand," the correspondent goes on, "wheat has been poured into British ports in such huge quantities that the markets are overstocked and an appeal has had to be made to British growers to defer the threshing of wheat in order to allow the accumulated stores to be reduced. There is now an embarrassment of supplies, due to the facilities provided

OK by all Mills and Railroads

EVERY LARGE MILL AND ALL RAILROADS in California have put their absolute stamp of approval on the bulk method of handling grain.

They are just waiting for **you** to start something. They know it costs less to handle grain in bulk. They know the grain growers of California are going to realize it mighty soon. And they have already prepared for it.

It's a fact that 10% of the grain grown in California never reaches market. The grower and shipper lose one-tenthof every crop—one-tenth of their possible profits.

Many "Hows" to Lose

How? There are many "hows." A few:—rats, rain, bad sacks, fire, thieves. And a big item in the profit-reducing sack method is the cost of extra help and supplies.

The mills and railroads are waiting for you to start something. Start it—the saving, economical, handle-your-grain-in-bulk way.

One "How" to Save

How? There is one "how." Install a Calco Metal Grain Bin on your farm. It costs little compared with what it saves. It's easily and quickly erected, even by unskilled labor. It will last more than a lifetime. It's strong, rust-resisting, weather, fire, vermin and thief-proof.

The Calco Metal Grain Bin fits **exactly** into the bulk handling method endorsed by mills and railroads.

San Joaquin County orchardist recommends the use of ferrets in disposing of ground squirrel pests.

for the shipment of this particular commodity. The result is that while the farmer is sparingly provided with necessary feeding stuffs, he is discouraged from threshing and marketing his wheat. Although the wet season has hindered threshing he has to withhold his corn in order that the overseas grower may realize his produce.

"Wheat is not the only article that is welcomed in opposition to home-grown commodities. Bacon, eggs, and various manufactures are accorded precedence in tonnage over essentials for generous animal production, so much so that it would appear to be the object, in allocation of transport space, to oppose rather than to stimulate and assist activity in the home countryside."

The correspondent sees "a point in connection with the cereal prices for the 1919 harvest that should not be permitted to escape attention. The government has guaranteed prices for controlled cereals equal to those fixed for the harvest last year, but nothing is said about the guarantee of a market. As far as the announcement is binding on the government it only pledges it to a price for what it cares to take over; the farmer is not assured of a demand for the whole or any of his corn. This matter should certainly be made clear without delay; otherwise growers of cereals may find themselves next winter in a position similar to that of grazers last autumn —assured of a fixed price but not of a market when a sale should be made."

The London Times explains that the home grown wheat in many cases has a high percentage of moisture and requires mixing with dry, strong wheat, of which there is but a small supply in Great Britain, so that the millers' capacity is limited. The Royal Commission of Wheat Supplies, through the Mills Control Committee, has reduced the milling extraction of home grown wheat as compared with the extraction of imported wheat in order to give greater inducement to millers to purchase as much home grown as possible and thus minimize the glut in the market. The board of agriculture has been assured, the Times says, that everything possible is being done to meet the situation and it therefore appeals to the farmers to proceed with the threshing of oats and barley, which are more urgently needed at the moment, and reserve their wheat stocks until the present congestion is relieved.

The Pure Seed Bill

Senate Bill No. 70, introduced by Senator Rigdon, should receive the support of every well wisher of agriculture in California. The bill is entitled: "An act to maintain the standards of purity and viability of agricultural seeds sold for sowing or seeding in the state of California; to provide for uniform labels; to create the division of seed inspection within the office of state commission of horticulture, appointing a botanist in charge, prescribing his duties ,and making an appropriation to carry out the provisions hereof."

Section 2, which specifies more particularly as to the provisions of the act, provides that the information given by the label shall be:

a. Commonly accepted name.

b. Name and address of seedsman, importer, agent or dealer.

c. Approximate percentage of germination, with month and year said seed was tested.

d. Approximate percentage of purity computed by weight, meaning freedom of such agricultural seed from foreign matter and from other seeds distinguishable by their appearance.

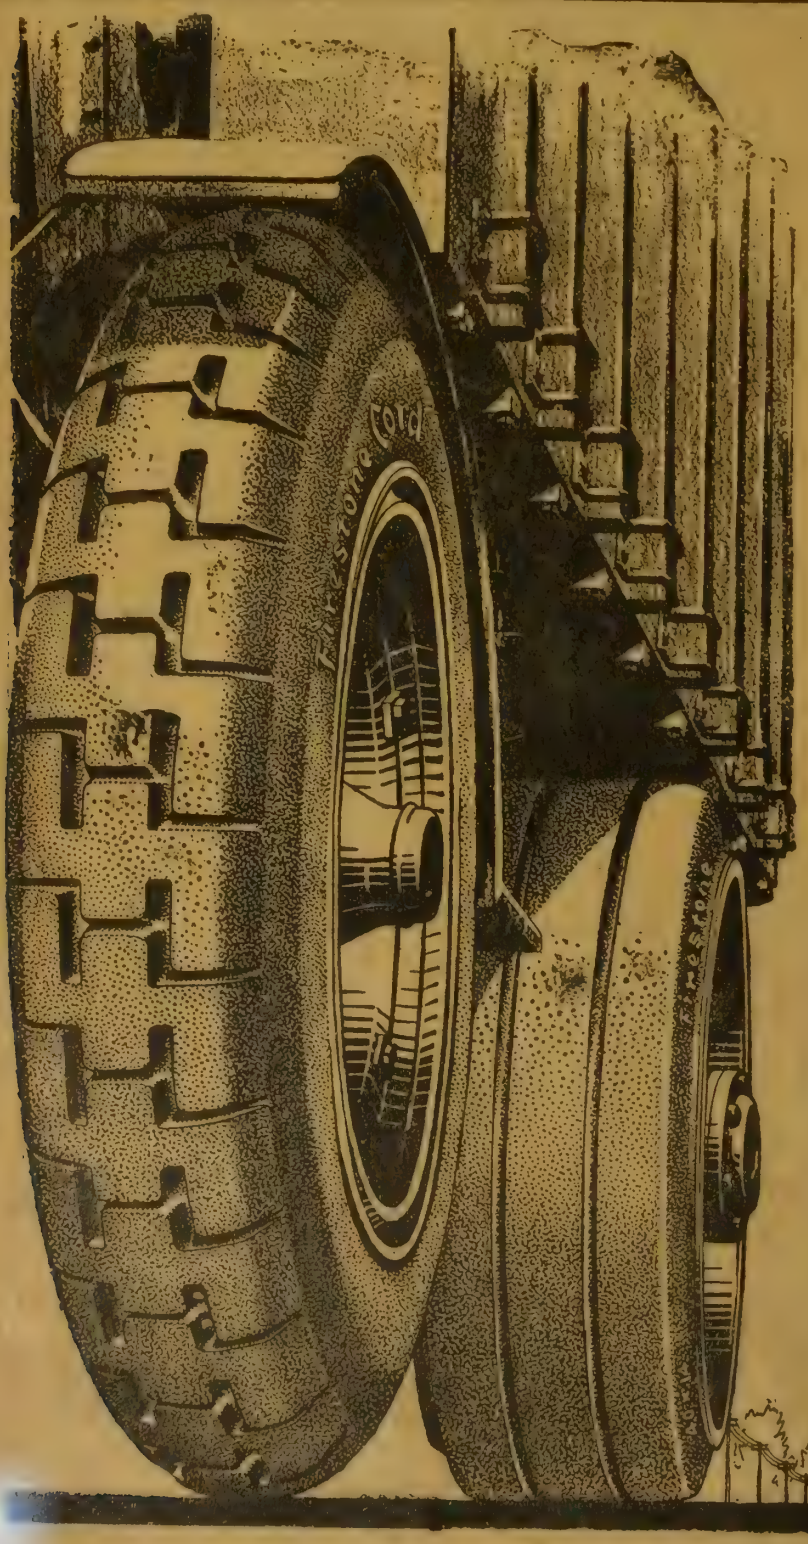
e. Locality where seed was grown; provided, however, that this requirement applies to cereal grains, corn and alfalfa seed only.

f The approximate total percentage, computed by weight, of wild seeds, with the name and approximate number per pound of each kind of seeds of the following named noxious weeds, or the seeds of other weeds which may be declared noxious weeds by the state commission of horticulture, which are present at the rate of, or in excess of, one such noxious weed seed in 10,000 of the agricultural seed: Dodder, star thistle, thistle, morning glory, Johnson grass, hoary cress, ribwort.

Section 3 has to do with mixtures of agricultural seeds, that is, those containing two or more kinds of seeds. These must have printed labels showing that they are mixtures, name of each, approximate percentage of inert matter, approximate percentage of germination, also name and address of dealer, importer, etc.

THE TRUTH ABOUT THE TRACTOR—WHY NOT?

Written by C. L. Butler, President of Butler-Veitch, Incorporated



TRACTOR manufacturers and users must face cold facts. If the truth won't sell the tractor, it is better not sold. If facts won't run them, neither will fiction.

The life of a gasoline motor is measured in revolutions, not years. In the mind of almost every man in the country the gasoline motor has become so associated with the automobile that he thinks of the two in the same terms. He measures the life of an automobile, and consequently his gasoline motor, in years. It is vital that the mind of the public, and particularly that of the farmer, be made to distinguish between years and revolutions if the tractor is to become a real factor on the farm. The man who expects too much of his tractor—or his wife—is doomed to disappointment. As long as the farmer is oversold on the tractor, either in his own mind or by the salesmen, there is trouble ahead. Let's don't kid ourselves. If the man selling—yes, and even building the tractor, does not know the facts, what chance for the farmer? The task ahead of the tractor man is to bring the facts to light —and these facts must be honestly presented. Fooling the public with sales eloquence will not give the tractor man a bank balance.

The motors in an automobile and a tractor are fundamentally the same. But motors are measured by the work they do, not the company they keep. The life in motors of equally good design and material is mainly determined by the number of times the crank shaft revolves. Factors influencing the motor's life in revolutions are the character of the load or strain under which it operates and the conditions under which it is lubricated. Both of these latter factors are greatly in favor of the motor in the automobile.

The load under which an automobile motor revolves varies greatly, and is generally very light, probably under normal average conditions, year in and year out, not more than 40 per cent of its rated capacity. Stop to consider how long a motor lasts in a racing car when it works at probably 90 per cent. The tractor motor operates under constant continued dead pull of about 75 per cent of its capacity.

Lubrication in an automobile motor also has points of advantage over a tractor. First, the speed of the car tends to cool the oil in the crankcase, and, secondly, the dust and dirt factor is almost negligible. Grit in oil makes excellent emery, and the moving parts, such as the pistons in the cylinders or bearings on the crankshaft, wear themselves away in short order. The field conditions under which tractors operate are such as to cause, in spite of all precaution, a great deal

Farmers Know Why

Half the truck tonnage of America is carried on

Firestone Truck Tires

Ever since the first days of rubber-tired vehicles, farmers of America have used Firestone Tires.

The quality which long ago gave Firestone Tires the lead, means more than ever in truck service.

With an increasing number of trucks going into Farm Service, users have the assurance of long mileage, protection to trucks, and protection to loads in equipping with Firestone Tires.

Branches and Dealers Everywhere

more dirt to reach the oil than gets to that in an automobile, which travels over surfaced roads. And even when in dust the speed of the automobile gets it past before the dust can enter the vital parts. The answer, then, to the lubrication problem is attention. The operator of a tractor must keep the oil clean. Whether it is necessary to drain the crankcase and refill with fresh oil once a week or once a day is dependent on the operating conditions, but the oil must be kept clean in a tractor motor. These two things are not the principal factor—they are merely handicaps. Remember them, however, in passing judgment.

Lubrication and character of load are only factors. Work done in revolutions is the real measure. Get these facts and a new respect for the motor in your tractor.

In the average automobile the motor revolves 2300 times to the mile.

In the average tractor the motor revolves 34,000 times to the mile.

The ratio of revolutions of the motors—tractor to automobile—is 15 to 1.

This means that every time you drive your tractor one mile your automobile would have to cover 15 miles to do the same work. During a season of 120 days a tractor will average about eight hours a day in operation, at a speed of at least two miles an

C. L. Butler

hour or an average distance of 16 miles a day. This is equal to 240 miles a day in an automobile. A day's work with a tractor calls for more revolutions of its motor than a trip from San Francisco to Fresno in an automobile—from San Francisco to Los Angeles every two days. That would be 27,000 miles every four months. The life of an automobile is figured at five years, and the average automobile travels less than 5000 miles a year. The average tractor, then, does more work in four months than the automobile in five years. Consideration of that fact inspires a new respect for a tractor motor.

We all know automobiles. I use one, a good one, famous for speed on the track and stamina across the continent. It cost over $2000. It has been about 20,000 miles in the last two years. It has been driven farther and probably faster than the average, but not so hard nor so fast as the motor in a tractor. It has had good care. Yet today there is over ten-thousandths play in the pistons—more than twice too much—and the valves have been ground at least six times, and the main bearings on the crankshaft have been scraped in once, and the connecting rod bearings are all either new or have been refitted, and the wrist pins in three or four of the pistons are now oversized, and there are some new rings on the pistons—leak proof to keep some of the oil down in the case—and countless little ignition, spark plug, carburetor, water pump, generator, etc., etc., adjustments and repairs. Oh, yes! I know there are some that run 50,000 miles without ever lifting the hood. That sounds well but it seldom happens.

Am I disappointed with my car? Not in the least. Has it cost too much to operate? Certainly not. It has had hard service, seen some rough trips. Cost some money to keep it in shape—sure! You can't ride on the train for nothing My automobile did and is doing all that can be fairly asked of it. The longer it goes the more it costs to keep it going.

Now let's give the tractor a chance. Crowd the money spent on your automobile motor during the last five years into four months, and how does it look? Get ready to spend as much or more on your tractor motor every season. Possibly you run your automobile only a year or two and then get a new one. If so your repair bills are small. If you were to get a new motor for your tractor every month or two, you would be doing as well by it—the proportion of work done is the same. Use your reason when appraising the value of your tractor motor. You can't bleed blood from a turnip. Don't expect the impossible. Measure your motor in revolutions not years, and every one will be satisfied.

And the sweet part of it all is that the costs are not prohibitive. Say, for example, that you operate your tractor 16 miles a day for 120 days. Assume that you have 120 acres which you plow once with a three bottom 12-inch plow and cultivate ten times with implements six feet wide. Traveling 16 miles a day with three 12-inch bottoms you would plow six acres; cultivating, you would double that. In the 120 days' operation of the tractor 20 days would be spent plowing and 100 days cultivating your orchard of 120 acres. Plowing six acres a day for 20 days equals 120 acres (once over). Cultivating 12 acres a day for 100 days equals 1200 acres (120 acres ten times over). Total acreage covered in 120 days at 16 miles a day, 1320 acres; 1320 acres at 10c per acre, $132.

One hundred thirty-two dollars intelligently spent on your tractor motor during every four months would keep it in perfect condition and replace it with a new or factory rebuilt one as often as needed. This is, of course, provided the motor is not abused.

The user of a tractor must prepare himself to pay for his tractor work on a basis of work done, not years in service. The manufacturer who assumes responsibility for his machine over a period of time instead of on a basis of work done is a poor risk for a conservative banker.

This fact is beautifully illustrated by the motor of a tractor. Working eight hours a day average to travel only 16 miles, the motor revolves 544,000 times, or 16,320,000 a month, or 65,280,000 times a season of 120 days. It looks like a liberty loan and must be given as careful consideration by all concerned.

Tractor motors must be measured in revolutions, not years.

TOO MUCH FOR SAM

At the end of three weeks of married life a Southern darkey returned to the minister who had performed the ceremony and asked for a divorce. After explaining that he could not grant divorces, the minister tried to dissuade his visitor from carrying out his intention.

"You must remember, Sam, that you promised to take Liza for better or worse."

"Yeassir, I knows dat, boss," rejoined the darkey, "but—but she's wuss dan I took her for."

"Nature's Way" of Air-Curing Hay The Dain System

AIR-cured hay has the greatest value, whether you sell it or use it on your farm for feed. The hay cures better and holds its color. The leaves do not become brittle and fall off so rapidly. There is less loss in handling. The hay keeps better in the mow, stack or bale.

You can make hay Nature's Way—air-cure it—by using the Dain System—a simple method that is revolutionizing the hay-making business. This requires only the use of a Dain System Rake. You can follow the mower closely with the Dain System Rake—turn the hay while the leaves are still active, delivering it in medium-size windrows on clean, dried-out stubble. When the mower passes over the field the heads of the hay fall back. Raking against the heads places the bulk of the leaves on the inside where they cannot sun-scorch, and the stems outside, insuring thorough evaporation of moisture.

By adjusting the angle of the teeth, the density of the windrow is controlled, allowing free circulation of air. AND THE DAIN SYSTEM RAKE HAS THE WIDEST RANGE OF TOOTH ADJUSTMENT.

It is an easy rake to operate. You can put machine in and out of gear, change the angle of the teeth and raise or lower the raking head with levers that are easily accessible from the seat.

The Dain System Rake has unusual capacity. This is made possible by the high steel arch and an exclusive feature—the inclined frame, which is highest at the point where the windrow is largest.

The Dain System Rake is enabling thousands of farmers to make hay that grades high. Get this extra profit out of your hay land by employing the Dain System of air-curing hay.

Free Books

They Must Be Healthy

The cows with the big production records are first of all healthy cows. Perfect health is more responsible for their scores than breeding or any other single factor.

It is a fact that more than 80% of the poor milkers in almost any dairy can show remarkable gains in milk production by the most simple home treatment and observation.

Such common and dreaded ailments as Abortion, Barrenness, Retained Afterbirth, Scouring, Lost Appetite, Bunches and such other complaints as arise from low vitality of the digestive and genital organs are readily eliminated by simple home treatment and judicious use of KOW-KURE. Almost all diseases can be reached by this wonderful medicine. The cow can then thrive on Nature's food and increased milk flow is inevitable.

You can add hundreds of dollars to your milk income by spending a few dollars yearly for KOW-KURE. Send for our valuable free book, "The Home Cow Doctor." It gives directions for the use of Kow-Kure in each disease—also contains a wealth of general information valuable to any cow owner.

Buy KOW-KURE from feed dealers or druggists; 60c. and $1.20 packages.

KOW-KURE

Pennsylvania Comes to California for Berkshires

ONE of the most important transactions ever consummated in Pacific Coast Berkshire circles was effected last week when Paul F. Krause, manager of the Sycamore Farms, Douglasville, Pennsylvania, visited a number of leading California herds ond selected 33 head of sows and boars for shipment east.

This is the second shipment of California Berkshires to Pennsylvania and both went to the same farm. It will be recalled that two years ago Milton R. Thomas purchased Grand Leader 2nd, grand champion at the Panama Pacific International Exposition, and 20 sows, from A. B. Humphrey, proprietor of the Grape Wild Farm, Escalon. The initial shipment attracted wide attention throughout the East.

Last summer Mr. Thomas entered the army, the herd was taken over by a relative who retained most of the Grand Leader offspring. So well did the California blood do, that the owners determined to build their herd around this blood and knowing that California was the fountainhead came West a second time.

Mr. Krause secured 10 gilts and two native sows, together with a fall boar by Big Leader, a son of Grand Leader 2nd, and a boar by Majestic King 6th, grand champion at the 1917 California State Fair, from Mr. Humphrey. All of the sows and gilts are rich in the blood of Grand Leader 2nd.

G. M. York, Modesto, furnished four gilts sired by Ringleader, a son of Grand Leader 2nd. The Butte City Ranch, Butte City, contributed eight gilts by Mayhew's Leader, a son of Grand Leader 2nd, and a young boar by Onward, son of the much talked of English boar, Epocal, but out of Escalon Fashion Princess, a daughter of Grand Leader 2nd. Anchorage Farm, Orland, furnished two gilts, daughters of Star Leader, the greatest son of Grand Leader 2nd, and two Superior Lustre gilts. Homer Hewins, Jr., Calistoga, put in two granddaughters of Grand Leader 2nd.

Considerable significance must be attached to this transaction. It indicates, first of all, that California breeders of any kind of live stock can be certain of a market much wider than their own state, if they produce the right kind of stock. Distance is no great factor when you have what the buyer wants. It also indicates that our breeders can, and are, producing Berkshire hogs that are the equal of any.

There is no reason to assume that what the Berkshire breeders have accomplished cannot be duplicated by breeders of other kinds of pure bred stock.

Mr. Krause was greatly impressed with the natural advantages of this state for live stock production. In commenting on his purchase Mr. Krause said:

"When I started west I expected to see good hogs, but I am frank to admit that I did not expect to find so many. I think I never saw as many Berkshires in any one county as I saw in Glenn County—they were everywhere and the quality was good. I am very much impressed with the opportunities of this state. But when one stops to think, why shouldn't your breeders raise the best? The climatic conditions are such that practically twelve months of green feed is possible, and I believe that this accounts for the very unusual size I noted in fall farrowed pigs. Your breeders really have a tremendous advantage over the East, where we are handicapped by long cold winters. In California, pigs farrowed in August or September can be turned on grass at weaning time and will have it all through the winter, while with us, fall pigs have to be kept in most of the time. Naturally California pigs have more size than ours, and I don't see why your breeders cannot build up a big business by furnishing Eastern breeders fall farrowed stuff to put in their fall sales the following year. California is attracting a lot of attention in Eastern live stock circles and I am confident that some day this state will be numbered among the great live stock states."

A Broader View Than Your Own Herd

Generally speaking, one cannot fail to be impressed with the character of men attracted to the business of pure bred live stock production. There is undoubtedly a fascination about the business that attracts men of a rather definite type. They are big, broad and generous, and the rare fellowship noted in the ranks of all breeders cannot be found in any other line of business. No business that the writer is familiar with is quite so dependent for its success, as a whole, on the integrity of the individual as is the breeding business. And the statement is ventured without hesitancy, that no business is conducted on a higher plane.

Occasionally, though, dissensions will develop and factions form. This is all very well in a way, if these differences of opinion will eventually lead to an improvement of the breed. But too often petty jealousy is at the bottom, and after being fanned from an insignificant beginning and allowed to continue, the net result is no personal satisfaction to either side and a setback to the breed. Which is simply a way of saying that these breeders' quarrels are a boomerang that will in the end hit the dissenters harder than any one else.

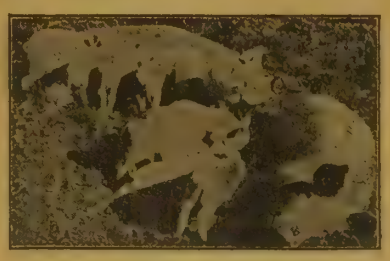
The future of all herds of pure bred live stock in this state is so full of possibilities and the field is capable of such tremendous development, that it would seem that the sooner such pettiness is eliminated the more profitable for all concerned.

There are hundreds of prospective breeders in this state today. Probably not one in ten has decided what breed he will select, but is it fair to assume that he will select the breed that is struggling under a handicap of a breeders' quarrel? Suppose he is really favorable to such a breed and upon investigation he finds a factional fuss, and granting that either side is right, is he likely to know the truth? Is it reasonable to suppose that any man would deliberately choose a breed whose promoters have little good to say of each other? We hardly think so. On the contrary we are rather inclined to think that he would want to associate himself with some other breed.

No breed is strong enough that the breeders can afford to permit a ruction in the ranks. It is inexcusable. There is room for all the breeds and breeders. The game is too big for littleness at any point.

Of course if there are those who must have their fuss, no one will object. But if they are willing to sacrifice their interests for the sake of their personal satisfaction, they might just as well make up their minds to step aside and watch the other breeds go by.

Be a booster. Speak well of the other fellow and his herd. If his stock is good it deserves to be spoken well of; if it is not—let the public form their opinion without your assistance. If the other fellow whips you in the show ring or beats you on sales there is probably a reason, and the chances are that he has better stuff. The thing to do is to determine to beat him by producing better animals—not by knocking him.



Every time a good herd is brought out or a good sale is made your business is helped. Every time you speak ill of your fellow breeder or his operations you hurt your own business.

NEW ORGANIZATION OF NORTHWEST LIVE STOCK INTERESTS

The live stock breeding interests of the Northwest have set in motion a plan of organization that promises much for the live stock development of that section.

Owing to the failure of the 1918 Portland show the breeders decided to attempt a plan of organization that would not only assure a winter show at Portland but would operate on a broader plan to the advantage of the

Flush Cows After Calving

Protect your herd against Contagious Abortion and Barrenness.

Barrenness or Sterility, like Abortion, Retention of After-birth and Premature Birth, is nearly always caused by infection of the reproductive organs by the germs of Contagious Abortion. Unless this infection is promptly overcome by the use of a powerful but safe antiseptic, it may permanently affect the reproductive organs so that the cow will continually fail to stick.

Every time a cow drops a calf—whether alive or dead—by premature birth or aborting, whether the after-birth is retained or not, her reproductive organs should be flushed out, because that is where the infection is developing.

B-K, the powerful non-poisonous antiseptic, is scientifically correct for this work. Used as a douche for the uterus, it quickly brings the after-birth, dissolves the slimy albuminous matter, kills the germs, stops discharges and controls the infection. B-K does not cause straining, but is soothing and heals the tissues.

Send for "evidence" and free Bulletin No. 52 "Contagious Abortion." If your dealer does not have B-K send us his name

entire live stock fraternity of Oregon and Washington, in particular, and the Northwest in general.

As stated above, the proposed plan contemplates a live stock show, but the big idea is to further the cause of better live stock. O. M. Plummer has been selected as general manager. The board of directors will consist of 40 members, representing every breed of live stock.

The organization will have strong financial backing. The city of Portland has agreed to duplicate any amount up to $250,000 and it is expected that a fund of $500,000 will be raised.

In a recent letter addressed to Professor Gordon H. True of the University of California, Plummer states that he will really be live stock commissioner for the breeders of the Northwest and that he plans to make his office "a clearing house for all live stock information, and to institute an aggressive campaign to eliminate the scrub."

Present plans call for a show classification with prizes second only to the International and the National Dairy Show.

80,000 PIG CLUB MEMBERS

In the recent report issued by the bureau of animal industry of the United States department of agriculture the following statement appears:

During the year 25 specialists working in 18 states supervised 35,980 members in the boys' and girls' pig clubs, an increase of 66 per cent over the year before. The present enrollment is more than 80,000 in 28 states. Records for more than 12,000 pigs show an average daily gain of 1.14 pounds and very satisfactory profits. Seventy-one per cent of the reporting members raised pure bred pigs. Financial aid by bankers plays an important part in the success of the pig club work. In Mississippi more than $50,000 has been lent to pig club members. The increase in production of pork due to club workers is evidenced by the fact that in several states the club members are shipping their hogs to market in carload lots. The pig clubs have been the forerunners of swine breeders' organizations, and in many states there are counties standardized to one breed of hogs as a result of the introduction of that breed for pig club work. The specialists have advocated economical production by the use of forage and pasture crops and the feeding of garbage and table scraps.

DISCOVERS CURE FOR GLANDERS

The Italian-American News Bureau, published in Rome, says several reviews of medicine and veterinary surgery in Italy speak of important researches looking to the cure of glanders, which afflicts horses and may also attack man, who almost invariably succumbs. At the beginning of the war the spread of glanders, especially among the horses of the Third Army, suggested to the colonel commanding, Dr. E. Bertetti, director of the veterinary service of the army, the idea of utilizing the victims of glanders in making experiments in regard to its curability.

Obtaining permission of the war ministry and the supreme command of the army the experiments were begun at Caorle in a sanitarium rigorously quarantined and equipped with all the latest scientific and surgical appliances.

Dr. Guido Finzi, head of the Institute of Pathology and Medical Clinics of the Superior Veterinary School of Turin, assisted Dr. Bertetti. After two years they announced that glanders was curable, not only in its chronic stages but also in its process of evolution.

The importance of the discovery and the evidence of the results obtained led the two experimenters to ask for a commission to make practical tests of their discoveries. The results fully confirmed the results announced.

NO WONDER

Mrs. Baye: "She is simply mad on the subject of germs, and sterilizes or filters everything in the house."

"How does she get along with her family?"

"Oh, even her relations are strained."—Tit-Bits.

Sooner or later you will buy a

DE LAVAL

CREAM SEPARATOR

If you have any use for a cream separator, it's only a question of time before you buy a De Laval.

Many buy a De Laval to start with and so avoid a lot of "separator grief."

Others buy one, two or three different machines before they finally learn by experience that "the best is the cheapest" and get a De Laval.

That's why, in the older dairy sections where separators have been in general use for many years, you'll find most of the machines are De Lavals.

"Claims" don't mean much to such farmers. They've had lots of separator experience. "Performance" means a thousand times more to them than claims.

They've watched the De Laval "perform" for several decades. They know that it is reliable and they stick to it, just as does the creameryman who is also "separator wise."

Why not be guided by the experience of these men and buy your De Laval "Sooner" instead of "Later?"

Order your De Laval now and let it begin saving cream for you right away. See the local De Laval agent, or, if you don't know him, write to the nearest De Laval office as below

Much Interest in Milking Shorthorns

Thomas Harrison, who has recently moved his herd of milking Shorthorns to Santa Rosa, states that there exists a very active demand for breeding stock and that it is his belief that during the next few years a large number of herds will be established in this state.

The appreciation for Shorthorn cows that have been developed along lines calculated to develop performance at the pail, has increased very rapidly during the past few years for the very good reason that these cattle meet the demand of the small farmer who does not care to enter the dairy business in a specialized way, but who does want to keep cows that are profitable to milk and that can produce a calf that is more acceptable to the butcher than straight dairy bred calves.

Mr. Harrison was born in England and came to this country a number of years ago to accept a place with James J. Hill, the railroad builder, who was one of the first to advocate the milking Shorthorn for Middle West farmers.

At the present time, the Harrison herd consists of about 24 cows in milk but he plans to increase the herd to about 40 head.

Foothill's Pioneer, a son of General Clay and out of the imported cow Tassel, a 10,000 pound cow, is at the head of the herd.

One of the Largest Berkshire Herds

One of the largest herds of registered Berkshires maintained in this state is owned by the James Mills Orchard Corporation, Hamilton City

Several years ago when Mr. Mills began his operations in the upper Sacramento Valley where his company controls several thousand acres of land, he was quick to note that there was a vast quantity of valuable feed in the shape of stubble, interplanted orchard crops and fruit that was going to waste and he became convinced that hogs could be utilized to better advantage than other classes of live stock, and being a firm believer in the efficiency of the well bred hog over the scrub he began collecting a valuable lot of as good Berkshires as were obtainable.

At the present time about 2000 hogs are being handled and of this number about 400 are pure breds. The plan under which the herd is being developed calls for as rapid replacement of the grades with pure breds as is possible, and it is expected that within a few years nothing but the latter sort will be in the herd.

Mr. Mills says that his experience in handling large numbers of hogs has been very satisfactory and that the hog department has always registered a profit, but that he has noticed that the better the hog the greater the profit.

The Mills herd is headed by Ames Rival 7th, grand champion at the 1918 state fair, and includes many excellent sows.

Western Berkshire Congress Sale

With the approach of the fourth annual Western Berkshire Congress and sale at Davis, Berkshire interests on the Pacific Coast are looking for one of the most successful meetings in the history of their breed on this coast. It will be a sort of a two-day Berkshire exposition with meetings, a banquet, barrow contests, carcass contest, students' judging contest and a judging ring of sale animals.

Secretary Homer Hewins, Jr., of the congress, gives an idea of the meeting in his letter to the breeders which is in part as follows:

"The Western Berkshire Congress will hold its fourth annual meeting and guarantee sale at University Farm, Davis, February 19 and 20. This promises to be the biggest event of the kind ever held in the West and you are invited to attend. Wednesday there will be a students' judging contest in which all the sale animals will be judged by the students for prizes. Fat barrows in pens and individuals will also be judged. Wednesday night there will be a banquet and goodfellowship meeting.

"Thursday is Sale Day and establishes a new record for hog sales as it is a guarantee sale and guarantee means just that. Each animal sold is guaranteed to be as represented and for 60 days from sale date the Western Berkshire Congress guarantees the purchaser of any animal that proves not to be as represented either a refund of his money or an exchange with the seller for an animal equally good.

"A secret committee will pass upon the merits of each consignment and animals that are not desirable will not be sold."

Another Star for the Guarantee Sale

The highest record bull ever offered for sale on the Pacific Coast is the latest entry for the Holstein Guaranty Sale to be held at Sacramento on March 27. He is a son of Adirondac Wietske Dairy Maid, the cow that recently broke the Pacific Coast record by producing 41.03 pounds butter in seven days and is still on test at this writing. This young fellow is a show bull and is sired by a 30 pound son of the $50,000 bull King Segis Pontiac Alcartra. He is consigned by Bridgford Company, who own the sire and dam. The Bridgford Company is making its greatest consignment to date in this sale, including three cows above 30 pounds, of which the largest record cow is the 37 pound cow Boweda.

McAlister & Sons have consigned a wonderful lot of daughters of their famous herd sire It, among them a daughter of K P. Tola, a daughter of K. P. Idyl Segis, and others out of dams from 29 to 32 pounds. They have also consigned a great 31 pound cow, and a granddaughter of Rag Apple Korndyke 8th that has the third highest milk record in the world for a two year old heifer.

A. W. Morris & Sons have consigned among others some splendid daughters of Prince Gelsche Walker, out of 30 to 32 pound dams, and all bred to the 34 pound bull Sir Aaggie Mead De Kol, who is the only bull in the world whose seven nearest dams average over 1000 pounds butter in one year.

These consignments are a sample of the quality throughout this sale and for the entire sale it is claimed by the management to be the highest bred, best individual lot of Holsteins ever assembled for a one day sale anywhere on earth.

Annual Shorthorn and Hereford Sales Announced

Announcement has been made that the annual sales of the California Shorthorn Breeders' Association and the Pacific Coast Hereford Breeders' Association will be held at the University Farm, Davis, during the week of April 7-12.

It is also probable that President L. A. Nares of the California Cattlemen's Association will issue a call for a general meeting of that organization to meet at Davis the same week, and an effort is being made to induce the California Wool Growers to meet a

the same time.

If all the plans materialize, and there is no reason why they should not, the week mentioned will be a memorable one for the live stock interests of the state.

Last year for the first time each of the cattle breeders' associations held a consignment sale. The Hereford sale was held at Davis and the Shorthorn sale at San Francisco. Each sale was declared a success, but at the time the feeling was expressed that if the two could be held at the same time and place that much better results could be looked for, and it is encouraging to note that the two associations can work so harmoniously.

The number of cattle to be offered in either sale has not been announced but it is probable that around 75 or 80 head will be sold by each set of breeders.

All who are interested in better cattle should make their plans to attend the two sales.

Catalogs of the offerings will be issued in due time and can be had by communicating with W. R. Madden, Dixon, California, secretary of the Pacific Coast Hereford Breeders' Association, and D. J. Stollery, 320 Sharon Building, San Francisco, who is secretary of the California Shorthorn Breeders' Association.

SHORTHORN MEN MEET AT SAN FRANCISCO

At the annual meeting of the California Shorthorn Breeders' Association, held in San Francisco, Thursday, February 6, the following directors were elected for the ensuing year: T. T. Miller, Los Angeles and Hollister; C. W. Hawkins, Hollister; Professor Gordon H. True, University Farm, Davis; Thomas Dibblee, San Francisco; Paul Foster, San Francisco.

Mr. Hawkins was elected president and David J. Stollery will continue to serve as secretary.

The retiring president, A. W. Foster, was host at a dinner tendered to the members of the association.

During the meeting, plans were completed for holding the annual association sale at the University Farm during the week of April 7 to 12.

THOUSAND DOLLAR BOAR GOES EAST

Dave Brant of the Elliott Brant Rancho reports sale to C. K. Hearn of Bellgrove Farm, Virginia, of Duroc boar, "Ebro" 264933.

This boar, it will be remembered, was the head of our herd of registered Duroc hogs purchased for us by Prof. J. I. Thompson. This animal was just a year old, weighed 500 pounds and was first prize and champion at the last California State Fair, in his class.

This boar was an outstanding individual in every way—a beautiful show animal. He was sired by a "King's Col" boar. King's Col get won more prizes for "get of sire" than the get of any other boar in America. He was out of a "Golden Model" sow—famous for their wonderful conformation.

The boar was sold, to head a herd of similarly bred sows at "Bellgrove," for $1000 cash and was fully insured.

Mr. Brant adds: "J. B. Manley is now in Nebraska trying to purchase for us sows of these blood lines, which have proved to be the big winners in the Middle West. We only expect to maintain a small herd of sows but these must be absolutely right in every way and will be headed by the best boar in the country."

ANOTHER BIG SALE

Rare opportunity is offered to secure one of California's finest ranches. Some of the richest land in San Joaquin Valley, watered, equipped, stocked, all ready for making of money. It is located in Tulare County and is known as the Whitten Ranch. There are 160 acres, 100 of which are in alfalfa, with barns, hog pens and sheds, and in fact all buildings arranged for live stock operations. It may be purchased with live stock and equipment, or otherwise, with easiest kind of terms, ten per cent down and ten per cent annually, interest at seven per cent.

In fact it is going to be put up at public auction by the manager, F. F. Allen. Rhoades and Rhoades do the auctioneering. Particulars regarding this great offering may be had in formal announcement on another page. The date of the sale is February 27, and 28 if necessary.

To Be Sold at Public Auction
The Whitten Ranch
Pride of Tulare County

With its full complement of tools, farm implements, live stock, furniture and furnishings; in fact EVERYTHING GOES

LIVESTOCK

The Whitten Ranch has for years been noted as one of Tulare County's show places. Not only is the ranch itself, one of the best developed, best appointed, best improved farms in Central California, but its fine horses, fine cows, fine hogs and fine sheep are so well known that it is not necessary for us to go into details in regard to the live stock offered in this great sale.

Horses

1 Team heavy Percheron mares.
1 Team medium Percherons.
1 Team matched sorrels.
2 Heavy mares.
3 Heavy mares.
1 Heavy horse.
1 Percheron colt seven months old.

Cattle

1 Registered Holstein bull.
Colantha
An excellent butter fat bull.
1 Young Holstein bull about eight months old.
1 Young Holstein bull about six months old.
2 Young Holstein bull calves.
10 Fresh Holstein cows.
26 Holstein heifers one and one-half to two years old.
6 Holstein heifers six to nine months old.
4 Heifer calves.

Sheep---Shropshire

1 Registered buck.
1 Young buck.
12 Ewes one year old.
25 Ewes about two years old.
18 Lambs.

Poland-Chinas

1 Registered boar.
Ideal Jumbo Boy, registry No. 311109. This fellow is a beauty and good enough to head any herd.

One of the best looking sows in Tulare County with six pigs eight weeks old.

A granddaughter of Hartsook's Big Bone Girl.
6 Bred gilts one year old.

These are beauties, just as good as money can buy, and all registered, and from well known families. Among these you will find:

Madam Sunshine No. 731430.
Madam Jumbo No. 731428.
Red Rose No. 731422.
Madam Big Ben No. 731412.

All of the above Poland-Chinas are top notchers and will compare favorably with the best.

Durocs

100 Gilts—mostly Duroc, some grade.
140 Barrows—mostly Duroc, some grade.

Implements, Tools, Machinery, Etc.

Too Numerous to Mention in Detail

Here is an opportunity for every farmer in Tulare County to buy that hog, that sheep, that heifer, or that cow as a foundation for a future herd. The live stock that is offered speaks for itself and will need but little help from the auctioneer.

Many a farmer, year after year, goes without that tool or that implement which, while necessary, has always seemed to be a little beyond his reach. Here will be the opportunity, and a little money will go a long way at such a sale; and the

RANCH

160 acres, less one acre used by the Sausalito school; 100 acres in alfalfa, 36 acres already planted to barley, balance being utilized for hog pens, corrals, houses, etc., etc.

WATER DEVELOPMENT. Three wells, equipped with electric power, furnish water for irrigation and domestic purposes.

Without a doubt this is the best equipped stock ranches in Central California. There are about 20 acres cut up into 40 fields, hog tight, with concrete watering troughs in each field; a large farrowing house, and modern up to the minute.

The former owner of this ranch, a man of ability and energy, spared no money nor time in developing this ranch into a most scientifically laid out farm. While inspecting the property you will be impressed at every turn with the foresight he must have had.

The main house is most substantial and a comfortable home. In addition there are two houses for married help. There is also a bunk house with five rooms, also shower bath, running water, etc. for the help. The outbuildings, including barns, pump houses, milk house, etc. are well constructed and well designed. If you want to operate a dairy or a stock ranch, or both, there need be no delay, nor could the most exacting buyer suggest any improvement.

Some one is going to buy Tulare County's finest farm for less money than the improvements could be put on it today and on terms that are ordinarily asked for raw land, the purchaser to put in the improvements. The Real Estate will be sold on the following terms: Ten per cent cash at the time of sale. Ten per cent per annum thereafter until fully paid, with interest at the rate of seven per cent per annum, payable semi-annually. Personal Property: Items less than $100.00, cash. Horses, cash. All other items: cattle, hogs, sheep, implements, etc. where the sum exceeds $100.00, one-third cash, and balance in three and six months time with interest at eight per cent.

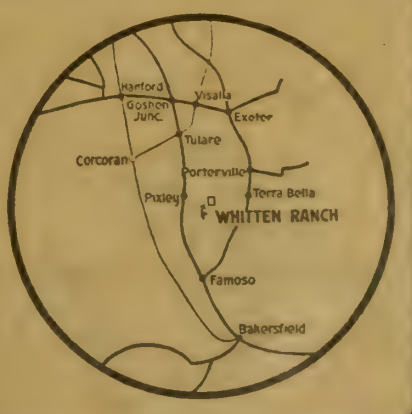
This valuable property will be offered at 10 o'clock

Thursday, February 27

and will be positively sold to the highest bidder. All bids are on the naked ranch. Nothing goes with it; no tools, no implements, no furniture. These will all be sold separately as well as the hay in the fields, the corn in the crib; in fact, everything goes.

We are expecting the greatest crowd that ever attended an auction in Tulare County and Jim Lee, the ranch cook, will be on hand with a lunch for every one at 12 o'clock.

Come Early



Colonel Rhoades will start the sale at

9 a.m. Thursday, February, 27, 1919

This sale will long be remembered in Tulare County as one when every man found what he long wanted. *For further information address*

RHOADES & RHOADES, 1501 South Main Street, Los Angeles, Cal., or FRANK F. ALLEN, care of Whitten Ranch, Route 1, Box 64, Terra Bella, Cal.

The map will show you the exact location of the Whitten Ranch. It lies about seven and one-half miles east of Pixley on the main county road, and is about the same distance west of Terra Bella in what is known as the Poplar District. Those coming from the West side, leave the boulevard at Pixley, turning east, where the signs will show them the way. Those coming from the East side, leave the boulevard at Terra Bella and follow our signs.

A Wonderful Offering of Holsteins

The 1919 Guaranty Sale of registered Holsteins, to be held at State Fair Grounds, Sacramento, California, on Thursday, March 27, will contain the most wonderful group of individuals ever assembled for a one day sale anywhere in the world.

This strong claim will be amply sustained on sale day as the remarkable individuals come into the sales ring, and in following announcements of this sale we shall set forth facts of sensational interest to every Holstein breeder in America, for there are animals in this sale worth a continent wide trip to see and own.

THE GUARANTY SALE

The catalog of this great event is being prepared, and it would be well to request a copy early as copies will be mailed only on application.

Hauser Packing Co. Los Angeles

Stray Thoughts of a Cowman

Written for California Cultivator By A. L. Spellmeyer

We read that the packers had a publicity fund of $3,200,000 and it would seem lately they are getting more than they paid for, so they should be happy. No man has a kick coming when he gets more than his money's worth.

Opposition to logical improvements in the handling and control of food products which may tend towards lowering living cost is merely greasing the skids.

Some of the commission men who are considered friendly to the packers seem to think there will be small spring cattle demand and prices may go lower. From the word we receive from about all the West these men had better wake up or they will be left at the post. Such a demand has never been known for cattle as has been already indicated, and spring conditions seem to be favorable for good grass everywhere.

Up the Coast they have had some more rain and now many of these men want cattle, now, pronto, especially big steers. Wanting and getting is a different proposition. We hear that big steers are held all the way from $75 to $90 by the head for spring delivery in range condition, and that 900 pound steers are running over 11 cents at feeder valuation right here in California. The Southerns have started out asking $37.50 to $39 for spring yearlings, $44 for cows, twos steers about $60 and threes up anything they dare to ask. The new government figures, notwithstanding all the close estimating and increased numbers from taxation, rather than actual increase in number, only show 287,000 increase in cattle last year. Totals are several million less than this country had ten years ago.

Where did the $3,500,000 put out in drouth loans go? Those poor devils down around Holbrook didn't get any of it, although they spent hundreds of dollars in wiring every known government department at Washington for help. Some of them might favor legislation to have all the men connected with the power of loaning money for drouth relief visit these drouth districts in a body. The best time would be after the winter freeze quits and when the thaw starts, around the water holes fringed with dead breeding stock. Gas masks should be provided.

It seems Los Angeles and San Francisco are now killing beef for export, and that several thousands of canners are being killed weekly, the plants running full tilt. It looks as if this Coast was going to have increasing beef demands each year, and if not easy to get good cattle now, what will it be later? The normal reserve seems to be exhausted here as in other markets, and that the old packers' buyer maxim "more cattle than money to buy them with" will fail this time.

Why is there not a uniform method of valuation of live stock in making income and excess profit returns? It is always well to be foresighted and look ahead. While neither cowmen nor sheep men have any considerable taxes to pay this year, as there has been more loss than profit in the Southwest, prospects are good for next year. One man values his sheep at $6.00 and another at $20. One man values a cow at $20 and another at $100. The more valuation the less tax to pay. Why not arrive at a uniform valuation based on market value and let everyone pay alike? It's only the big outfits that can afford the kind of bookkeeping which makes plausible the big valuations, and most of these have been in business longest and originally bought cheapest.

While it is open season on packers we must admit they have some darned good qualities. They are efficient and in many ways must restrain their ardor for profit in order to encourage producers, or they won't have anything to sell. Not many producers or consumers either want to see them under government ownership. All producers or the average cow man asks is for them to keep their mitts off the markets and money and quit playing games. Some things get so big they run the men who own them instead of the men running the business, and encourage the idea that profits and the business are above any other consideration. No cow man, feeder, or good citizen want to see the packers hurt or their business injured, and no one denies their right to a fair return for their work.

If the things we are told are true (and most of us believe the country is greater than any group of men), and wrongs must be corrected, for the good of the country and its production, and if control of producer, feeder, retailer and packer will help stabilize meat conditions and lower costs of living, let it come on.

Some mighty fine men represent the packers, and aspersion on their individual honesty of purpose would be unjust. There may be some slight abuses and matters which could be improved, but nothing that long term government loans to stockmen, and a government controlled stock yards, would not correct. Let us have some action. Arguing it out won't help production we need now.

Relative to cattle versus beans, we hear that up the Coast many cattle men cannot buy stock for their depleted ranges until they can get money, and they cannot get money until the beans are sold. We hear that there are over a half million bags stored in one county of unsold beans.

This state has, we understand about 65 per cent of the 6,000,000 bags of beans in the country or over $40,000,000 worth. Just think of it, 3,900,000 sacks of beans, enough to feed on an exclusive bean diet a million and a half men for a hundred days.

Stockmen are the experts on the bean question, and any experienced bean eater can state truthfully that a straight bean diet would be a sure cure for Bolshevism. Russia isn't so far away from California and needs food. Let them have our surplus beans. To elucidate:

Those of us who have lived on beans from necessity rather than choice for considerable periods know they are a concentrated and sustaining food. It takes a lot of hard work

VALUE TELLS

To maintain the high standard I have established I am consigning to the Poland-China sale, Hanford, February 22, the extremely high class sow King's Jumbo Lady and Betsy H, one of the best sows in Kings County. Also four gilts by the $700 boar, King's Big Bone Leader, and two growthy young boars. One by Young Jumbo and one by King's Big Bone Leader.

Careful investigation will prove these animals worthy your consideration.

Lower per cent of butterfat

Dairymen handling Holsteins do not hesitate to admit that the milk of this breed contains a lower percentage of fat, but in view of their enormous yield of milk they average more butter per cow and they produce a larger margin of profit.

to make a man so fit he can start the morning with about four platefuls of the succulent bean, ride all day, and finish in the evening and consume more beans.

The various methods of cooking and preparation will be soon learned by the man in camp who has only beans, flour and coffee. Bean soup is O. K., and there are regular boiled beans with or without bacon rind, and there are beans fried with a stray onion overlooked in the [redacted] of the kiax, but if a man is a fancy cook and wants a cha[redacted] can have mashed beans. It [redacted]ame the wildest Bolshevik to [redacted]ans for three or four months.

Blood thirst and anarchy [redacted]d vanish from his morbid mind[redacted]e would have to work hard in ord[redacted] eat the beans and have to eat them in order to work. Truly a panacea. Nobody ever did see any bad cowboys who were working on a bean diet, as they were too busy working to keep up their appetites, so they could each meal look the festive bean right in the eye and show they were not quitters. Let's prescribe beans for anarchists.

WHAT THE CALF CLUB MEANS

By Frank D. Tomson of the American Shorthorn Breeders' Association

IT IS questionable whether any more useful venture has been made in the matter of the adoption of improved bovine standards than that of forming boys' and girls' calf clubs. In various communities, counties and states these calf clubs have been organized. The extension departments of several state agricultural colleges have taken this work in hand and out of it has come some very remarkable results. The breed associations have materially aided in the formation of such clubs through local banks, more especially where registered calves have been selected for the fitting contests. The American Shorthorn Breeders' Association has been particularly active in this line of education and extension work, and has encouraged many a boy and many a parent to substitute registered Shorthorns for the grades that had previously been grown on the farm.

The contests held under the direction of the several college extension departments have usually been conducted on a strictly beef basis. The calves used in these contests are usually grades of the several beef breeds with an occasional cross-bred or pure-bred calf represented. Under such a plan the calves are started on feed at a stipulated date, the care being given by the boy or girl who has entered the contest, and has either chosen or been assigned the calf. The feed and care provided are left to the judgment of the fitter largely within a few prescribed limits. The effect is to create a keener interest on the part of the fitter in the development of the animal. The fitter is asked usually to make up a statement of the weight of the calf at the beginning and of the plan followed in the fitting, and this effort has naturally led to closer attention to the matter and a deeper interest in the outcome. The contests usually run for a period of three to six months and are concluded at a date agreed upon, sometimes at a local fair or at a county or state fair. The contest is usually the most interesting part of the program, whether held at the state fair or a lesser occasion. It is an inspiring sight to see fifty or more boys and girls, with the calves which they have fitted, lined up for the final ratings. There is many a surprise and many a triumph that will have a lasting effect. The showman's instinct is quickly uncovered and many a loser leaves the ring with a determination to return another day and hold a winner.

The practice of the Shorthorn Association has been to encourage the adoption of registered Shorthorn calves for the contests and then at the conclusion sell the calves in an auction sale after they have been passed on in a prize contest. The fitters are permitted to bid on the calves whether their own or the entries of others. This gives the owner the choice of letting his calf go at a price that seems to him satisfactory or placing a higher bid and retaining it. In this plan there is developed a business instinct that is quite as useful as the fitting experience. In the majority of cases the

Dollar-Making Facts For Stock Owners

What is Pratts Animal Regulator?
Not a food. A general conditioner and tonic for horses, cattle, sheep and swine of all ages. A health builder and preserver.

What does it contain?
Medicinal herbs, roots, etc. Natural tonics, appetizers, digestives, blood-purifiers, worm-expellers. A scientific, perfectly-balanced combination needed by working, producing and growing animals.

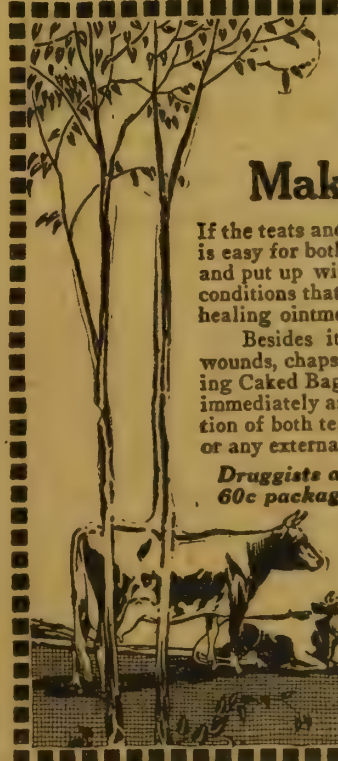
What does it do?
Pratts Animal Regulator improves and preserves health and, *in a natural way*, increases strength, growth and production. Prevents most diseases. Saves feed by aiding digestion. Makes rich, red blood and improves circulation. Regulates the bowels. Expels irritating worms. Makes livestock more profitable.

Does it give satisfaction?
Satisfaction guaranteed or money refunded. The user to be the judge. America's original stock tonic and conditioner, widely used for nearly fifty years.

How is it used?
Daily, in small quantities, mixed with the feed. Full directions with each package.

What does it cost?
The price is low—large packages most economical. Pratts Animal Regulator actually *costs nothing*, since increased production returns the investment with *big profits.*

Where can I get it?
From 60,000 Pratt dealers. There is one near you. Direct from manufacturers if your dealer can't supply you.



Can I learn more about it?
Yes! Write the Pratt Food Co., Philadelphia, for valuable FREE BOOK on profitable management of live stock. Mail your request today.

BAG BALM
MADE BY THE KOW-KURE PEOPLE

Makes the Milking Easy

If the teats and udder are healthy and comfortable the milking is easy for both cow and milker. No need to punish the cow and put up with reduced milk flow through sore or diseased conditions that can be so easily removed by using this great healing ointment.

Besides its wonderful soothing and healing effect on wounds, chaps, scratches, etc., Bag Balm has no equal in treating Caked Bag—so common at the calving period. It penetrates immediately and quickly brings about a normal, healthy condition of both teats and udder. Very useful in treating Bunches or any external hurt.

Druggists and Feed Dealers sell Bag Balm, in liberal 60c packages. Be sure to have it on hand always.

Berkshires for Profit

Annual Congress Guarantee Sale

UNIVERSITY FARM, DAVIS, CAL.

Thursday, February 20

50—Selected Bred Sows, Gilts and Boars—50

The Offering:

Following an established precedent, the Western Berkshire Congress offers for sale 50 head of carefully selected bred sows, gilts and boars. Every animal selected for this sale represents, to a high degree, the most acceptable type of modern Berkshire—size, quality, vitality, bone and prolificacy being insisted upon. Every sow listed is guaranteed to be a breeder or purchase price refunded.

Berkshires are the profitable hog. They are money makers. There never was a better time to enter the hog business than NOW. The scrub must go, and this sale offers an opportunity to replace the low producing scrub with a profitable pure bred at a reasonable price—your own price.

Remember, every bred sow sold is a guaranteed breeder

The few boars to be offered are of the highest class and fit to head good herds or go into any kind of a herd and sire the kind of pigs that will be profitable. The blood lines are the best, the type is right, the quality is first class and the price—your own.

Breed Berkshires—The Standard Hog, The Hog of Quality, Style and Vitality

The Congress Meeting:

The Annual Meeting of the Western Berkshire Congress will be held the day preceding the sale. Matters of vital interest to the hog industry will be discussed by men competent to talk on every angle of the business.

A Fat Barrow Contest will demonstrate to all the reasons why the Berkshire is the Universal Breed.

A Carcass Contest will be conducted as a demonstration of the killing qualities of the Berkshire.

A Student's Judging Contest will bring out emphasis on the finer points of this great Breed.

The Berkshire Dinner will be held the evening before the sale.

A 2-DAY BERKSHIRE EXPOSITION

Meeting: Wednesday, February 19th. Sale: Thursday, February 20th, 1 o'clock.

Catalogs and other information may be secured by filing applications with the Secretary.

WESTERN BERKSHIRE CONGRESS

calves are purchased as a lot and then appraised and allotted to the contestants at the appraised price. Local banks have played a very important work in financing and in many cases organizing these clubs and seeing them through to the final windup. The banks have found that these clubs have stimulated a vast amount of interest in better live stock standards not only among the young people who are the principal factors in the plan but among the land owners and tenants throughout the community as well. They have found that it is a good business move for the bank and for the entire neighborhood.

Preference in these pure bred clubs is for heifers of breeding age, and they are usually bred after they pass into the hands of the contestants and brought into the sale with this added advantage and value. For this reason it is desirable that a few good bulls be included in the contest in order to insure an adequate supply of bulls for use on the heifers, and also to provide a better class of bulls for the various herds in the community.

We have in mind one bank in Illinois that has placed the club on a three year basis. Nothing is to be sold from the club except the surplus bull calves until the three year period is completed, and then the produce from these heifers originally purchased is offered at auction. The value of such a plan is easily seen. The only objection that might be offered against it is that the time might seem rather long to the boys and girls in the contest. They might allow their interest to lag before the time had expired.

The great value of these clubs is that they start the young folks along the road to higher standards in an entirely natural and effective way. They learn without the irksome experience of having to be taught as the average boy understands the term. They become business men and women at the outset, and, once having acquired the practice, it will grow. The advantage of the plan followed by the Shorthorn Association is that it puts into their hands the standard at the outset that ordinarily they might be years in attaining. In the usual course of things it is a long stretch from a herd of common or grade cattle to pure breds. This plan shortens the distance—in fact, it eliminates it altogether.

Not only this, but it serves to tie the boy permanently to the farm who might otherwise become identified with other lines and lose the advantage the home farm with its equipment and established good will offers. Many a master in the art of bovine breeding will grow out of these club contests who received his first inspiration therein. It is constructive work of first importance, and its further extension will have a most useful bearing on the permanency of the industry.

LIVE STOCK NOTES FROM ARIZONA

A heavy fall of snow the latter part of December covered the higher elevations, particularly in the northern part of the state. This caused some temporary discomfort to cattle, and resulted in some losses, which were however more than offset by the fact that the snow served to extend the area where grazing animals could find water, and also by the improvement of the range resulting from the melting snows. This snow fall had largely melted in January and another heavy snowfall came the first of February. In the vicinity of Pinedale nearly two and a half feet fell. At Flagstaff, Prescott and Williams, a little less than two feet. Rainfall over the desert section of the southern part of the state aided materially in helping out the feed for the thousands of sheep that are wintering there.

The heavy snows have given the hunters of predatory animals an opportunity to get in some effective work. Two cow punchers near Flagstaff have invented a coyote trap to catch a whole pack at once. Recently they caught twelve in one night. George Ainsworth of Walnut Creek killed a female lion and three young ones a few days ago. Ramsey Patterson, a government hunter, has killed six mountain lions in the past month near Skull Valley. L. E. Croxdale, also of Skull Valley, recently brought in about 30 coyote hides.

Live Stock News Notes

Live Stock Commission About Through

C. B. Cunningham, president of the California Swine Breeders' Association, and who for the past 18 months has been a member of the live stock commission for the federal food administration for California, states that the work of the commission is practically completed.

During the war period the live stock commission rendered high service to the live stock producers of this state and was instrumental in securing some very important regulations relating to different phases of the industry. Indeed, on several occasions, the work of the California commission attracted the attention of Washington.

Buys Berkshires and Shorthorns

H. M. Hanman of Crystal Springs has purchased from W. M. Carruthers, Live Oak, the two fall yearling Berkshire gilts, Live Oak Lady 2nd, and Live Oak Lady 3rd. These two gilts were in the winning exhibitors' herd at the 1918 state fair. They were sired by Ames Rival 100 and out of Rival Lady 34th. Both are bred to Mayfield Superbus.

Mr. Hanman also secured a June Shorthorn calf sired by Count Glory and out of Silver Rose, a granddaughter of March Knight.

A Correction

In the issue of February 8, reference was made to the Castleview Berkshire Ranch, Calistoga. This ranch, as is quite well known, is at Santa Rosa and is owned by J. Francis O'Connor. When Mr. O'Connor established the ranch he selected the name, Castleview, which was the name of his grandfather's estate in Ireland, so named because it was in sight of a famous Irish castle.

During the past year Mr. O'Connor has perhaps transferred more Berkshires on the books of the American Berkshire Association than any other breeder in California, owing to the fact that he liquidated the famous Brush herd, and purchased and resold most of the Berkshires in Hopland herd.

Recent sales from this herd include 10 bred sows and gilts to the newly established Pure Bred Sow Farm, Sacramento.

Elliott Brant Sells Guernsey Bull

The Elliott Brant Rancho reports sale of a Guernsey bull to Seward Rickerson, Hermosa Beach. "The bull is sired by one of our 'May Rose' bulls and is out of one of our big A. R. cows. He will head the herd of Mr. Rickerson's grade Jerseys. This cross is proving to be a very profitable one."

Making for Better Stock

Dr. E. J. Weldon, popular Sacramento Holstein breeder, is now secretary of Jane Garden Farm, owned by Fred W. Kiesel, Sacramento. Dr. Weldon's own herd is still doing business, however, as his great young cow Ontario Blonde Pietje is now on test and has over 33 pounds butter to her credit in seven days. This young cow was originally sold in the guaranty sale last December by Mr. Kiesel to McAlister & Son, Chino, for $850. The McAlisters made a 30 pound record on her as a four year old and then consigned her to the Sacramento June sale, where she sold to Dr. Weldon for $1700. With her present record, coupled with her splendid breeding and individuality she is worth several times her last selling price. At freshening she dropped a fine bull calf sired by It.

A 37 Pounder

Adirondac Wietske Dairy Maid, one of the top Holstein cows in the Bridgford Company herd at Knightsen, is on test and has to her credit 37.12 pounds butter and 795 pounds milk in seven days, giving her the third highest butter record in California. Two of her sons have been sold in public sales of California Breeders Sales and Pedigree Company, one of them now being owned by H. E. Cornwell, Modesto, and the other by D. D. Elmore, Tulare.

Daughter of a King

Ruby Walker Pietertje 3d, a daughter of the famous King of the Black and Whites, has made over 30 pounds butter and over 600 pounds milk in seven days. The sire is at the head of Henderson Company herd, Sacramento, and he thus becomes the only sire of a 30 pound daughter that is backed on both sides by three direct generations of 30 pound cows.

Opportunity

Walter F. Mitchell, Visalia, will offer a splendid lot of registered Holsteins in his public sale on April 10. He will sell all of his cows of miking age, retaining only the young heifers, and will sell also the choice herd sire Prince Hiske Walker, to whom most of the females are bred.

Will Retire

E. R. Putz, Laton, will disperse his herd of Holsteins at public autcion on April 9. There will be 37 registered cows, heifers and bulls in the sale, and about the same number of high grade cows and heifers. Mr. Putz feels that he has earned retirement after an active life in the dairy and breeding business, and his sale will provide an opportunity for others to secure the choice animals which he has developed.

Some Picked Toppers

News of the guaranty sale which will be held by the Holstein breeders at Sacramento to March 27 indicates the most important Holstein sale yet held in the West. The highest record cows ever sold in the West have already been entered. In addition to picked tops from leading California herds there will be some really sensational consignments from Carnation Stock Farm, Hollywood Farm, and Albert E. Smith, all of the state of Washington. The Washington entries include a number of outstanding females bred to Judge Segis and to the $106,000 bull Carnation King Sylvia.

Red Cross Calves Bring $43,843

During the National Western Live Stock Show held at Denver last month 1050 heifer calves, donated by Colorado and Wyoming cattlemen to the Red Cross, were sold for $43,843. Each calf carried the brand A.-R.-C.

New Poland-China Records

If the record breaking hog sales being made in the East are true criterions, there must be an abiding faith among Eastern breeders in the future of pork production.

The most recent record to be hung up was registered when Fred Sievers, Audubon, Iowa, sold 38 head of sows and gilts for $28,700, an average of $760. A spring gilt by the $10,200 Col. Jack topped the sale at $1700.

The day before, R. W. Halford, Manning, Iowa, sold 40 head of Poland China sows and gilts for an average of $640. In this sale the world's record price for a sow of any breed was established when Mammoth Giantess was sold for $3400.

Eastern Chester Whites For Billiken Herd

C. B. Cunningham, whose Billiken herd of Chester Whites is one of the best known in the West, is planning to expand his breeding operations and has placed several orders with leading Eastern breeders.

Recent sales include the good sow, White Eagle Tessie, by Missouri Lad and out of a state fair grand champion, to F. N. Wood, Jr., of Menlo Park and a Billiken boar to Ernest Gammon of Hood.

UNCLE SAM—AGRICULTURIST

Continued from Page 199

way for the promotion and practice of better methods.

Space limitations prevent more than cursory mention of the scope and achievements of the many federal farming offices at the national capital. The recent war time work of the various agricultural agencies is significant of the vast variety of labors which they perform. For example, the bureau of chemistry assisted the war and navy departments in preparation and testing of munitions of war, in addition to doing valuable experimental work such as producing charcoal for gas masks, water proofing leather, conservation of alcohol, sugar and glycerine, water proofing uniforms, supplies and materials and aiding the signal corps in chemical research work—all in addiiton to carrying on much of its normal investigational work.

The forest service has protected Uncle Sam's extensive wooded areas and has influenced the production of much wool and mutton by offering free range to thousands of sheep ranchers. It disseminates information about forests and their protection and development, while recently it has been of great service to the war department and shipping board in supplying facts about the value of various woods, their strength, seasoning and adaptability for airplanes, ships, military vehicles, and the use of alcohol derived from wood by chemical processes. During two recent years an additional 1,000,000 head of live stock have been placed on forest ranges, representing about 25,000,000 pounds of beef, 16,000,000 of mutton and 4,000,000 of wool.

The federal department has stimulated production, increased its control of plant and animal diseases, reduced losses from cattle ticks, hog cholera, tuberculosis, predatory animals, and crop pests; and in conjunction with the department of labor it has helped farmers to secure more labor. It has safeguarded seed stocks and has aided farmers in securing high grade seeds at cost; in combination with the treasury department it has loaned money from the president's special fund to distressed farmers in drouth stricken districts. It has helped in transporting live stock from feed-short sections; assisted in the marketing of farm produce and, under severe handicap, teamed with the countrymen in securing an adequate supply of fertilizers. At the direction of the president it is administering under license the control of stock yards and of the ammonia, fertilizer and farm equipment industries.

The bureau of animal industry, which wages constant warfare against animal diseases and which also has charge of meat inspection work, has accomplished remarkable work in ridding the South of cattle ticks. Of the area originally quarantined 52 per cent, equivalent to 379,312 square miles, are now clean of ticks and available for extensive cattle raising operations. During the last five years the department has reduced hog cholera losses 50 per cent, from $75,000,000 in 1914 to $32,000,000 during the year ending March 31, 1918. Work is in progress in stamping out bovine tuberculosis in 40 of the states. The first list of 1000 owners of herds of pure bred dairy cattle which are certified as clean of turberculosis has been published.

At present the federal meat inspection service covers 884 establishments in 253 towns and cities. Last year a total of 58,629,612 animals including 10,938,287 cattle, 3,323,079 calves, 8,769,498 sheep, 35,449,247 hogs and 149,503 goats were slaughtered and examined, an aggregate of 7,905,184,925 pounds of meat.

The bureau of markets, through its market news service now distributed through 90 branch offices over 14,000 miles of leased wires, has facilitated the shipping operations of producers and distributors who deal in produce, fruits and vegetables, butter, eggs, cheese, grains, hay and seed. Information is also given out on wholesale meat prices and the movement of live stock to market as well as the "in" and "out" movements of cattle from certain feeding districts. This bureau now has charge of the issuance of all reports of live stock receipts and prices from the Chicago Union Stock Yards as well as the enforcement of the grain standards act.

The bureau of crop estimates, with its regular monthly and annual crop reports and its special inquiries for countrywide information relating to various phases of agriculture, is a qualified interpreter for the farmer. It assembles and deduces from facts and figures what the farmers grow, the condition of the plantings at various seasons of the year and the prospects for harvest as compared with previous years. Approximately 200,000 farmers report to the department regarding crop conditions in their localities and supply the mass of material on which the government crop estimates are based.

The weather bureau benefits the farmer by advising him about storm conditions so that he can arrange his calendar of field work to correspond with the findings on the weather map. The bureau of plant industry counsels him as to what crops he should grow in his rotation and how he should prepare his seed bed. The bureaus of plant industry and entomology help him to combat plant pests and insect diseases while the bureau of soils advises him what fertilizers to use and whether or not his soil is acid and needs lime. The bureau of chemistry will tell the farmer about the different kinds of commercial lime and what material will be most suitable for his local application. The states relations service aids those counties desiring farming experts to secure agricultural agents who assist the farmers in every way possible so that the farm income may be increased while farm life may be made more attractive. The bureau of markets helps the farmer to dispose of his surplus crops or fat live stock and suggests ways in which he can improve his marketing operations. The office of farm management shows the farmer how to keep tab on his annual net income so that he may eliminate the leaks and losses which often are parasitic on the possible profits. In a word, Uncle Sam has provided an efficient agency for practically every farming exigency which can arrive, all these institutions being amalgamated to form the federal department of agriculture.

George Washington first suggested the organization of a branch of the national government which would be devoted to the interests of the farmers, while Benjamin Franklin, when he served as agent of Pennsylvania in England, sent home silk worm eggs and mulberry cuttings to start silk growing. After the Revolution, American consuls and naval officers of the United States continued the work started by Franklin by sending home seeds and crop cuttings and by aiding in the introduction of new breeds of domestic animals. The first commit-

3 P&O Features { Simplicity, Strength, Ease of Operation

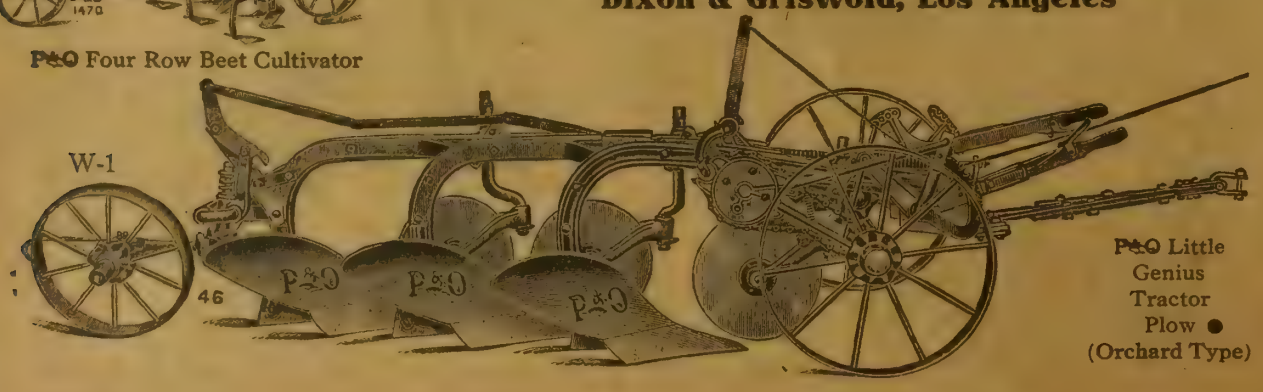
Simplicity. The founders of this company determined upon the principle of simplicity and this feature has been applied in the building of all P&O Implements for more than three-quarters of a century. The P&O Line is noted for this—the absence of superfluous parts, and yet for the masterly provision for all needed and useful adjustments.

Strength. Strength is obtained, first—by the weight and quality of material; second, by the scientific use of material, securing that strength, rigidity and freedom from trappiness for which P&O Implements are noted.

Ease of Operation. Ease of operation is secured by a combination of simplicity with the application of certain mechanical principles which have been followed out in the construction of all P&O Implements.

76 Years of "Knowing How" Hammered Into Every One of Them

The P&O Line has been delivering the goods for over 76 years. It is a line built upon the idea that quality must receive first consideration—must be maintained regardless of any other consideration. It is not only a real quality line, but is a complete line, consisting of Plows, Harrows, Planters and Cultivators in all standard styles and sizes.



P&O goods are sold exclusively through the retail implement dealers, and we have agencies throughout the country. We shall be pleased to send our catalog describing the entire line of P&O Tillage Implements or the P&O Tractor Plow Catalog to any address. If you are interested in Tractor Plows, Tractor Disc Harrows, Tractor Listers or any other Tillage Implements, it will pay you to study the P&O line before purchasing.

SURFACE IRRIGATION

To keep thoroughly posted subscribers should read every advertisement in the California Cultivator columns.

tee on agriculture was appointed in the house of representatives in 1820 and in the senate in 1825. Eleven years later the commissioner of patents assumed the responsibility of accepting gifts of seeds and distributing them among the farmers. In 1839 congress made its initial appropriation of $1000 for the collection of agricultural statistics and for other agricultural purposes. Similar funds were appropriated in 1942 and 1844 and have been repeated annually since the latter date.

Up to 1862, under the direction of the commissioner of patents, work has continued in collecting agricultural statistics as well as the distribution of seed. The department of agriculture, under the leadership of a commissioner of agriculture, was established by a special act of congress of May 5, 1862, the same year that the Morrill law for the establishment of agricultural colleges was passed. Honorable Isaac Newton was appointed the first commissioner of the new government department. By 1880, under Commissioner W. G. LeDuc, the department had developed to include six divisions—chemical, seed, entomological, statistical, microscopical, and botanical, in addition to the general office, experimental garden and grounds of 40 acres, laboratory, museum and library. Four years later, the bureau of animal industry was formed to protect and promote our live stock interests. In 1886 the division of forestry as well as other divisions, including economic ornithology and mammalogy, as well as pomology, were created.

In 1889 the department became an executive department with a secretary at its head who occupied a place in the president's cabinet. At this time the functions of the department had expanded to such an extent that they involved practically all lines of agricultural efforts of general interest in the United States as well as other lines of acivity related to agriculture. Norman J. Coleman was the first secretary of agriculture, being succeeded by Jeremiah M. Rusk. During the regime of Mr. Coleman the Hatch bill, which created the office of experiment stations, was enacted. Under the administration of Mr. Rusk the first Farmers' Bulletin was published; investigations of foreign markets were conducted; epidemics of pleuro-pneumonia were controlled and the weather bureau was established, it being transferred from the signal corps of the war department.

The units or organization of the United States department of agriculture have been changed from time to time to meet growing conditions, and at present include eleven bureaus, two offices, one division, two boards and the library. The bureaus are Weather, Plant Industry, Animal Industry, Markets, Chemistry, Forest Service, Soils, Crop Estimates, Entomology, Public Roads, Biological Survey, States Relations Service. There are also the Division of Publications, office of Solicitor, office of Farm Management, Federal Horticultural Board and Insecticide and Fungicide Board.

SUGAR AMPLE

The prospective production of sugar for the season of 1918-19 is about 188,000 short tons less than the annual average for the five years just before the war which, as compared with a total of 18,750,000 short tons, is not of great significance, and the current crop is regarded by the United States department of agriculture as practically sufficient to meet a normal world consumption even if present stocks did not exist. Attention is called to the fact, however, that the world sugar supply is not normally distributed. There is a shortage in the beet sugar production in Europe of 50 per cent of the prewar average, amounting to about 4,150,000 tons, while in the same time the cane sugar output has increased by 3,842,000 tons, and the beet sugar crop of the United States is 131,000 tons above the prewar average, though the smallest since 1914. No considerable increase in beet sugar production is expected within the next 12 months, though it is expected ultimately to exceed that of prewar times.

The CHEMIST says= "genuine GIANT is always uniform"

At every Giant Powder plant the chemical laboratory controls the processes of manufacture. They make continuous tests that insure the unvarying high quality of Giant Powders. Each pound of Giant Powder is exactly like every other pound of the same grade. Such uniformity means economy, efficiency, safety. Professional users of Giant Powders—miners, quarrymen, contractors—all know that the name "Giant" stands for utmost dependability in explosives.

When you have land to clear, trees to plant, subsoil to be broken or ditches to be blasted, tell your dealer to get for you one of the Giant Farm Powders—Eureka Stumping or Giant Stumping. Don't accept any ordinary dynamite, but insist on genuine Giant Powder, bearing the Giant trade mark on every box.

A postal will bring you our book, "Better Farming with Giant Farm Powders." Its 52 pages are full of short-cuts and labor-saving methods.
